In 1867 the Reverend Thomas Baker and seven Christian missionaries were murdered and eaten at one of the islands. It is a curious fact that no less than six villages now lay claim to the possession of the martyr's head. This reminds us of the Holy Land, where the head of St. John the Baptist is preserved at Samaria, Damascus, and Aleppo. Perhaps nothing brings more forcibly home to us the circumstance of the wonderful reform effected by Christianity than that it should have taught such savages to act upon its concisely formulated protest against all these inhuman barbarities in the command to "do as you would be done by," for now these frightful customs have almost entirely ceased. Indeed, it is hard to realize that a people so friendly and gentle as the Fiji Islanders are now described as being, and amongst whom so earnest and childlike a devotion to Christianity seems to prevail, could have taken part only a short time ago in such fearful crimes and orgies. The present King of Fiji, Thakombau, to whose enlightened and energetic conduct the success of missionary enterprise in the islands and their ultimate transfer to British rule is due, was not always the exemplary character he is now reported to be. The first fifty years of his life were passed in the deepest darkness of cannibal heathendom, and when his father, a terrible old chief, died, Thakombau exercised the privilege of an eldest son, and with his own hand strangled his mother and assisted in performing the same kind office for the other widows. King George of Tonga also played some part in the conversion of the islands. This monarch, by the by, is the one who amused his white friends at the breaking out of the war between France and Germany by issuing a proclamation that he intended to remain neutral.

As the picturesque record of a sojourn in little known lands, and a thrilling account of customs which are happily becoming things of the past, *At Home in Fiji* is a very interesting and readable work.

#### LETTERS AND PAPERS OF THE REIGN OF HENRY VIII.\*

(Second Notice.)

WE learn from the despatch of the Imperial Ambassador, of which we gave some account in our last article, that Dr. Lee was of opinion that nothing could be done in the matter of the divorce if the Queen persisted in her allegation of virginity at the time of her marriage with the King; and also that the Duke of Suffolk and his wife, the Queen-Dowager of France, would, if they dared, have offered all possible resistance to the marriage. Anne Boleyn, though she had yet to wait she knew not how long—and, in point of fact, did wait nearly a year and a half—before she was actually married, must have been pretty sure of her ground. She seems to have exercised an absolute sway over the King, and actually at this time threatened the Controller of the Household that when she was Queen she would deprive him of his office. The volume we are reviewing reaches beyond the date of the marriage. But it contains not one word of suspicion that it had taken place. The remarkable expression in Cranmer's letter that the marriage ceremony was performed "much about St. Paul's day" has misled all historians, who suppose that he must have intended the Festival of the Conversion of St. Paul, January 25, 1533. But it is almost certain that he meant St. Erkenwald's day—i.e. November 14, 1532—on which Sanders and others have said the marriage took place. The Pope's Breve warning the King on pain of excommunication to dismiss Anne and take back Catharine was dated the very next day; but it was too late, Anne was already married, and the concealment of the day was meant to allow of the supposition that she had been married at any previous period which might be conjectured by any curious inquirer.

The phase of the case for the divorce which occupies nearly the whole of this volume is the protest of the King of England against being summoned to Rome for its trial. It is very dreary work following the history of the consistories held, and the technical difficulties in the way of admitting Sir Edward Carne in the capacity of Excusator. Several of the documents connected with this part of the case appeared for the first time in the Oxford Records of the Reformation; but probably nearly every accessible paper on the subject will be found in Mr. Gairdner's volume. But, though we suppose the editor was not bound to insert every document that has appeared in print, it would have been more convenient if he had added the few documents that are supplied in the Trevelyan Papers, as also the account of the Acta Consistorialia, as published by Dr. Maziero Brady in his useful work

\* *Letters and Papers, Foreign and Domestic, of the Reign of Henry VIII.* Preserved in the Public Record Office, the British Museum, and elsewhere in England. Arranged and Catalogued by James Gairdner, Assistant Keeper of the Public Records, under the Direction of the Master of the Rolls and with the Sanction of Her Majesty's Secretaries of State. Vol. V. London: Longmans & Co. 1880.

on "the Episcopal Succession of England, Scotland, and Ireland, A.D. 1400 to 1875." It would have added but a few pages to the volume, and would have in one or two cases supplied information not to be found, or at best only to be found with difficulty, as to the dates and proceedings of the Consistory Court at Rome. Thus the letter of February 13, from Ghinucci and Benet to the King, was, no doubt, intended to give the earliest intelligence that it had been determined not to admit the Excusator; but we only learn, from the following extract from Dr. Maziere Brady's volume, that the refusal was made the very day before:—

*Die 12 Februarii 1531 fuit Consistorium in loco consueto in quo Reverendus D. Paulus Capissuccius retulit quendam Anglicum comparuisse tanquam unum de populo ad excusandum Regem Angliæ eo quod non comparebat in causa matrimonii.*

And this is the more important because, in a letter written by Mai to the Emperor of the same date, he speaks of this Consistory having been held on the 10th. Two accounts agree in placing it on the 10th, and it is possible the copy from which Dr. Maziere Brady printed was in error.

Again, there is an entry in the Barberini MSS. concerning the Consistory of December 11, 1531, which shows that Dr. Gairdner's conjecture that Christmas must be read for Easter in Mai's despatch to the Emperor, which is dated on the following day, is correct. The delay it appears was really granted till the Festival of the Epiphany, 1532, and accordingly the next Consistory was held on the 8th January. Mai's despatch was in Spanish, and in all probability the word used is *Pascua*, without the addition of *de Natividad*. It was not an uncommon mode of designating Christmas at that time in Spain. We remember that Don Pascual de Gayangos found the same expression in one of the documents analysed in his last volume, and translated it *Easter*, though it plainly meant Christmas.

Matters were now drawing to a conclusion. Everybody except the English Ambassadors saw that the judgment could not be delayed much longer, and that sentence must be pronounced against the King. On the 25th January, 1532, Dr. Ortiz informed the Emperor that the English had petitioned for delay on the ground that fear of the Emperor prevented the advocates whom they had written for from appearing, and that they had been allowed till the end of the month, and that the Pope had told him he was determined to give sentence "even though the Kings of France and England should separate from the Apostolic see." On the very same day Clement wrote to the King of England a gentle letter of remonstrance, hoping that he would not oblige him to forsake the character of a loving father and assume the function of a judge; but that he would recall Catharine to his Court and put away the woman with whom he was openly cohabiting. Another despatch of the period speaks of Anne Boleyn having recently had a miscarriage; but, as the document in question was not written from England, it only gave currency to a report, and must be taken for what it is worth. Notwithstanding all appearances, the disputes about preliminary matters were destined to delay the cause for many months, nor was it till March 23, 1534, that the definitive sentence was pronounced which ordered the King to take back Catharine as his wife on the ground that the marriage was valid. Here, however, we are anticipating matters, as the volume before us does not reach beyond the end of the year 1532.

One naturally expects to find in such a volume as this some tidings of the future Archbishop Cranmer, about whom opinion seems of late to have taken a turn—State papers seeming to reveal to us the character of a time-serving hypocrite, instead of a saint and a martyr. But, though there are so many documents analysed from the originals at Vienna, they do not tell us anything that was not tolerably well known before; and this is the more remarkable because he was with the Emperor as Ambassador during the year 1532, from January till November, when he was recalled, for the express purpose of pronouncing against the marriage with Catharine of Aragon. He is noticed as on his way home at the beginning of 1531, and as succeeding Sir Thomas Elyot as Ambassador in the following year. He had reached Ratisbon where he met Elyot, March 14, and he is still there August 28 and September 4, from whence he was recalled October 1, when Hawkins was substituted in his place. On October 20 he was at Villach, and evidently had heard nothing of Warham's death. And it was not till November 18 that the letter of recall reached the Emperor, with whom he was residing, at Mantua. On his way home he was ten leagues off from Lyons December 9, and must have reached England some time before the end of the year 1532. The meeting of the King and Cranmer at the bear-baiting, when the archbishopric was given him, must, if the story be true, have taken place almost immediately on his arrival. The documents in this volume enable us to determine the whereabouts of Cranmer during the whole year, and so to expose the errors both of Strype and of Herbert. The former represents Cranmer as not returning to England at all in 1531, and the latter makes him present at the marriage on November 14. Cranmer himself tells us he did not know of the marriage a fortnight after it had taken place. And, in point of fact, he could hardly have heard of it till his arrival in England, more than a month after.

With regard to this subject we have been sorely puzzled by a note appended to Chapuy's despatch to the Emperor of January 22, 1532. The passage in the letter is as follows:—

The new Ambassador to the Emperor will start in a few days. Does not know why they are discontented with the present Ambassador. This man

is one of the doctors who was at Bologna with the Earl of Wiltshire, on whom and his daughter he depends entirely. He has written in favour of the divorce and was one of the translators of the King's book. Expects he will be ordered to obtain opinions from the German universities whether Lutheran or otherwise. If he has no better future than the Augustinian Lutheran whom the King caused to come here with a safe conduct, he will not do much. The said Lutheran returned as he came with much ill-will from the English.

Now all this evidently refers to the recall of Sir Thomas Elyot and the substitution of Dr. Thomas Cranmer in his place as Ambassador with the Emperor. The matter is so evident that we should not even have expected a note at the foot of the page to explain who was alluded to; but undoubtedly a reference to this place ought to have appeared in the index under the head of "Cranmer," instead of which we have a note substituted saying, "It does not appear that any new Ambassador was really sent to the Emperor for some time after this date." It is true, the letter of credence for Cranmer, dated January 24, does not appear in this volume or elsewhere that we know of. But it is mentioned by Seckendorf, and it is plain from other documents in the volume that Cranmer started on his journey a very few days afterwards towards the Court of Charles.

There were rumours abroad that the King had married his mistress, "that diabolical woman," as Muxetula calls her; but it was not commonly believed, and it must have been known that it was not so when she was raised to the rank of a Marchioness on September 1, 1532, preparatory to her accompanying the King across the Channel to his interview with Francis. The French King was of course nothing scandalized at the nature of the connexion of his dear brother of England with Anne Boleyn, but must have wondered at the infatuation of the persistent desire to make her his Queen.

The interview of the two Kings was conducted on the grandest scale, almost recalling the glories of the Field of the Cloth of Gold. But Henry did not gain all he wanted by the interview. Mr. Gairdner truly remarks in his preface that as a great demonstration of the close alliance between England and France the interview was undoubtedly a success. He has described the state of affairs very neatly:—"If Francis could have been induced to recognize the favourite as Queen of England, Henry no doubt would have been emboldened to defy the censures of the Vatican. But Francis, though not an over-scrupulous person in what concerned mere social morality, was not likely to countenance an open violation of Church law in defiance alike of the Pope and the Emperor, merely for the sake of his most dear brother and ally. He was willing enough to dance with the Marchioness of Pembroke; but to dishonour the Emperor's aunt by acknowledging any one as Henry's queen was a responsibility he could not have been willing gratuitously to incur" (p. xxviii.)

There are many other points in this volume well worthy of study for any one who is tolerably acquainted with the outline of the history of the period. Most people will probably have to unlearn much of what they have been taught to believe by popular historians, for if there is any period in English history that has yet to be written, it is undoubtedly the history of the reign of Henry VIII. from the fall of Wolsey to the accession of Edward VI.

#### CREDULITIES.\*

UPON Mr. Jones the mantle of the late Mr. Timbs appears to have fallen. Mr. Jones may be proud perhaps to be named in the same breath with Mr. Timbs, though, in good truth, we do not intend to compliment him even when we add that the pupil is worthy of his master. The material here gathered is tolerably amusing. We do not often find so much of the kind garnered between two covers. Of numberless authors cited, each brings his own little bundle of rubbish; and it is reserved for Mr. Jones merely to provide a store for it. Unfortunately, to carry out the parable, the stuff has not been arranged in the storehouse, and, should the authors desire to get it back again, they may not find it easy to know their own. Here and there a passage is duly labelled; but even the labelling is often defective, and is sometimes, so to speak, second-hand, betraying a fact in the history of some particular pieces. They have passed through one store after another, until their original inventors have been forgotten. There may be some kind of object in these storehouses of useless knowledge. Many books which pretend to be collections of prehistoric facts intended to throw light on the manners, bad or good, of modern mankind, are little better than Mr. Jones's book on Credulity; but, as a rule, there has been some philosophical system pursued, and the pigeon-holes of the store-room are arranged in an intelligible sequence. In the volume before us there are clear divisions, and each chapter is itself subdivided, but the apparently purposeless mixture of different kinds of facts, and the absence of anything like an adequate index, render it useless to the student. The very first requirement of such a book is a full and correct index. To test Mr. Jones's compilation, after reading a number of scattered notes in different places on, for example, the superstitious connected with Thursday, we find that the word "Thursday" does not occur in the index. Again, there is a curious and lengthy list from a French source of the judicial prosecutions of animals for crimes in the middle

\* *Credulities; Past and Present.* By William Jones, F.S.A. London: Chatto & Windus. 1880.

ages. This list occupies pages 303-305, and is duly entered in the index. Some thirty pages further on is a similar list from a Flemish source, *à propos* of nothing in particular, and there is no mention of it that we can find in the index. The index itself is in a sense alphabetical, but a majority of the entries are under such headings as "Luck," or "Superstitions," and are arranged much as they come. It will be seen that in order to make any use of the book the reader will be obliged to make his own index, and the more so because the paragraphs are put into pages just as they were shaken out of Mr. Jones's portfolio, care only being taken to keep certain general subjects together. Thus one page begins with an account of an ancient ceremony of sheep-blessing, performed apparently in London, but this is not very clear; the second paragraph relates to the worship by the Romans of Pales, the goddess of sheepfolds; the third mentions Beal Zebub as the protector of the people of Elkon from gnats; the fourth mentions the tutelary deities of Olympian, Elis, Troy, and other places; the fifth gives us a quotation from Plautus as to the sacred pigs of the ancients. It will be seen at a glance that this is very amusing reading, but that it would be impossible to make any serious use of such mixtures.

There is a certain kind of arrangement discernible in the table of contents. The sea and seamen, with various anecdotes more or less entertaining about them, take up rather more than the first hundred pages. Then come notes about miners, amulets, talismans, and rings; then words, letters, and numbers, and divination by them. The next chapter relates to the exorcism and criminal trials of animals, followed by similar extracts about birds and eggs, the volume concluding with a chapter on Luck. It is evident from this summary that we need not fear to light upon many dull pages. Nor is the book in the least dull, except to the reader who goes to it for exact or trustworthy information. But any such reader will have been warned by the frontispiece what to expect. This curious engraving, by no means badly executed as a work of art, represents "the trial of a pig at Lausanne in the fourteenth century." It is so full of anachronisms that to mention them all would be to describe the whole picture. One point will be sufficient to show its value. Three of the principal persons present wear spectacles, and a fourth uses an ear-trumpet, and this in the fourteenth century. But we have perhaps devoted too much time and space to an attempt to take Mr. Jones's book seriously. It will be better to accept it for what it is—a mere compilation of notes and anecdotes, without any object except to amuse the general reader. Viewing it in this light, and consenting to be amused only, we may find an hour's recreation in turning over Mr. Jones's pages; at the same time noting, with some surprise, that the compiler has attained an honour which was never accorded to his forerunner Mr. Timbs, as he is a Fellow of the Society of Antiquaries.

Marriages naturally occupy much space in a book devoted, like Mr. Caxton's great work, to the history of human error. Marriages in May were still considered unlucky in Italy in 1750, says Mr. Jones; to which we may add the surprising fact that 130 years later the same superstition prevailed in that peninsula, as well as in England. Sprinkling the bride with wheat is a custom mentioned by Herrick. The modern fashion of throwing rice over her seems to come from India, but it has long been common in Italy. The Registrar-General—when, we are not told—notes the frequency of Scottish marriages on the last day of the year. There are more marriages on that one day than on any other seven days put together. There may be reasons for this which the student of Scottish morals could give, but Mr. Jones contents himself with quoting the fact, as also another from the same satisfactory source—namely, that in England few marriages take place on Friday. Out of 4,057 marriages in the midland districts of England, not two per cent. were celebrated on Friday. A visit to the vestry-room of St. George's, Hanover Square, would have afforded Mr. Jones an example of the same kind nearer home. Of a contrary kind is the Scottish experience of Mr. Watson, City Chamberlain of Glasgow, who observes that nine-tenths of the marriages which come under his notice are celebrated on Friday. It is curious to note that in India a rainy day is considered unlucky for a wedding, and that in Scandinavia Thursday, the day of Thor, or thunder, was also of bad omen. St. Eloy, in a sermon, warns his flock from keeping Thursday as a holy day; and Dean Swift, in a letter to Sheridan, rhymes Thursday to "cursed day." The Estonians consider it unlucky, and in Devonshire it has but one lucky hour. Mr. Jones, who, by the way, makes no mention of Thursday as the fatal day of the Tudors, does not attempt to generalize from these curious facts, which, indeed, we have picked out from different parts of the book. Unlucky days in Cochin China—perhaps among the Mohammedan Malays, but we are not told—are the third day of the new moon, being that on which Adam was expelled from Paradise; the fifth, when the whale swallowed Jonah; the sixteenth, when Joseph was put into the well; the twenty-fourth, when Zachariah was murdered; and the twenty-fifth, when Mohammed lost his front teeth. The ancient Egyptians were like the Chinese in their careful observance of lucky and unlucky days, and Mr. Jones may turn with profit for his next edition to Mr. Michell's amusing *Calendar*, in which they are detailed at length. Mr. Jones says that from ancient Egypt the evil or unlucky days have received the name of Egyptian days, given them in "a Saxon MS. (Cott. MS. Vitell. c. viii. fo. 20)." They are the last Monday in April, the first in August, and the "first Monday of the going out of the month of

December," which leaves us somewhat in doubt as to all the Mondays in that month.

The chapter on birds, though as ill arranged as any of the others, contains as many notes of interest. The ancient Egyptians, as Mr. Jones observes, denoted the soul by a bird. With this he connects "a parrot from the East, a partridge, or a goldfinch." But the Egyptian word "ba," the soul, was hieroglyphically denoted by a crane. So on the obelisk of Heliopolis "baoo," the souls, or the spirits, refers to the intellectual spirits of the temple of On. In the later inscriptions a king's soul is sometimes represented as a hawk; but we have never seen the parrot from the East, the partridge, or the goldfinch. In this connexion a curious legend, well known to the readers of *Westward Ho!* is quoted from Howel's Letters as to the Devonshire family of Oxenham. Howel saw in the shop of a stone-carver a marble tomb with an inscription on it in memory of John Oxenham—"In whose chamber, as he was struggling with the pangs of death, a bird with a white breast was seen fluttering about his bed, and so vanish'd." The same story was narrated of three other members of the family. The apparition is accounted for in a ballad. The story of Thomas Lord Lyttelton, who died in 1779 near Epsom after seeing a similar vision, is well known. So lately as in 1860 a cormorant which appeared upon the spire of Boston church was believed to announce the death of the borough member. Minors appear to be more superstitious about such warnings than even sailors. A collier in South Wales saw a ghostly train drawn by a ghostly horse, one of the cars bearing what he supposed to be a spectre representing his own body. "To alight such a manifestation would be tempting his own fate. The substantial miner was apprised that a shadow had appeared without his permission, and the following day he fled from his fate to another colliery." Whistling, it seems, is not permitted in mines. Mr. Jones somewhat enigmatically adds that sailors share this superstition. He probably intends to refer to the sailor's common practice of whistling for a wind, and does not appear to be aware that in the East whistling is looked upon with disfavour, as a practice full of evil omen. One part of the chapter on mining superstitions is so characteristic of the whole volume that we may conclude by an account of its heterogeneous contents. It begins with a large capital and a new paragraph, as if to denote a change of subject, the previous division having been chiefly devoted to the superstitions of Cornish miners. The first paragraph relates to French miners, and their belief in the apparition on certain occasions of a white hare. Next there is an anecdote about their dislike to working on Sundays. Then follows a quotation from Nicander Nucus as to the colliers of Liège. So far Mr. Jones has kept pretty near the subject of French mining superstition; but the next paragraph, without the slightest warning, carries the reader's attention off to the West Indies, and then to Mexico. A quotation from Agricola follows; but Mr. Jones has forgotten to tell us to whom it relates. Finally, there is a short passage from a book by a Mr. Hingshawe, to prove that Protestant miners, we are not told in what part of the world, have a superstitious veneration for the palms blessed on Palm Sunday; and so the chapter ends. It will be seen that to enjoy Mr. Jones's pages the reader must lay aside all hope of receiving consecutive information, and rest content to read notes wholly without arrangement, told without object, proving or disproving no theory or opinion, and chiefly amusing because of the unexpectedness with which a new subject is started, often before the old one is exhausted, to be itself laid aside without any reason, and perhaps taken up a few pages further on. It is impossible for a reviewer to treat seriously such a crowd of undigested, ill-assorted cuttings.

#### MINOR NOTICES.

THE author of the two little books about Eton life called *A Day of My Life at Eton* and *About Some Fellows* has now brought out a small volume of papers which originally appeared in the *Cambridge Review*, under the title of *Cambridge Trifles* (1). In an "Advertisement" he says:—"I republish these sketches of some of the more trifling incidents that go to make up the inner life at Cambridge in the hope that, having served to amuse the Cambridge world when issued separately and one by one, they may to some degree answer the same purpose for the public in general when taken all together." It may be admitted that in their collected form they pass muster as a thing to take up and glance at or through in an odd ten minutes or half-hour; but we cannot congratulate the writer on having collected and republished them. *A Day of My Life at Eton* was amusing, and even interesting enough, as a really accurate and unpretentious record of what many Eton boys' days are; and *About Some Fellows*, though here and there it verged upon tediousness, was no less accurate, and showed a decided advance in writing power on the author's part. *Cambridge Trifles*, though neither inaccurate nor pretentious, is unhappily for the most part very far from amusing, being neither better nor worse than the many papers of the same kind which have made their appearance at various times in the various University magazines which have flourished for a more or less brief space. The best section of the little volume is the

(1) *Cambridge Trifles*; or, *Splutterings from an Undergraduate Pen*. By the Author of "A Day of My Life at Eton," &c. Collected and revised from the "Cambridge Review." London: Sampson Low & Co.

one headed *Σπερμολόγος*, in which a fellow-undergraduate—whose nature is indicated by the title—recounts his thoughts and deeds to the author, and it is to this part of the book that we would advise the casual reader or glancer to direct his attention. In this there are, indeed, some happy touches, one of which we may select as a specimen of the whole:—"But, as I was saying, I don't think, under ordinary circumstances, it's a good thing to read much during the examination. Because it's like being in for a race; you don't go and run a course just before the race itself; you take rest and relaxation. I'm taking relaxation now; come round to see you. But be sure and say if you think you want to work. Because I wouldn't like any one to say that my system interfered with any one else's. Like that fellow Cocket, you know, who's always dropping in and wasting one's time when one doesn't want him." We may also refer to an account of *Σπερμολόγος* and his dog, which is amusing enough; but the other portions of the little book cannot be said to have enough merit to justify publication. They might, indeed, conceivably be useful as an antidote to the rubbish of "Julian Home," inasmuch as though, in their way, they are twaddley enough, they are at least not marred by sentimental cant. But it may be hoped that the author could do better work than he has here turned out if he would take trouble enough, and would learn to avoid the dangerous pitfalls of attempted smartness.

It is pointed out in the preface to the present edition of Messrs. Cassell and Co.'s French-English and English-French Dictionary (2) that the French Academy "have in the seventh and latest edition of their Dictionary introduced 2,200 words which were not in the preceding editions, suppressed some three hundred more, and modified the spelling, accentuation, and hyphens of many others." Accordingly Messrs. Cassell's Dictionary has been remodelled on excellent principles. Obsolete words, instead of being removed altogether, are distinguished by a peculiar mark, and very necessary and laudable additions have been made to the new words which the Academy in its wisdom has sanctioned, while a list of nouns of double gender with their meanings has been added. It may perhaps be doubted whether it was wise to follow the Academy in printing *phthisie*, *rythme* for *phthisis*, *rhythme*, and so on; but this is a very minor point. Of the general excellence and completeness of the work there can be no doubt; and one of its most difficult features, the short treatise on French pronunciation, calls for decided praise. No such treatise can of course be altogether satisfactory, but the one before us is commendably free from errors. Between the two divisions of the Dictionary is placed a useful table of French coins, measures, and weights, reduced to English terms. In turning over the French part of the Dictionary we happened to come on a word the existence of which we have heard denied by a Parisian, although it may be seen inscribed on the windows of various Parisian pot-houses—*scubac*—formed from *usquebaugh*. Oddly enough, it is not given as an equivalent for whisky in the English part. It is perhaps worth noticing, inasmuch as the formation of whisky and *scubac* from *usquebaugh* makes something like a parallel to that of évêque and bishop from episcopus. The form *usquebane* figures in the abridgment of Boyer published in 1849.

The latest edition of Dr. Brewer's *Dictionary of Phrase and Fable* (3) may be said to be improved, inasmuch as such absurd headings as "Bird—told me, a little," have been altered, if not removed; but it still contains, which is not surprising, some things which are ridiculous enough. Under *Box*, for instance, we find "*box o' the ears*. This is the Greek *pux* (fist), a blow with the fist," and "*Box and Oox*, the two chief characters in John M. Morton's farce usually called [the italics are ours] *Box and Cox*." Again—and this is far more inexcusable than the absurdity of saying that a thing is "usually called" by its right name—Dr. Brewer informs us that *brosier*, a term which he explains correctly enough, is derived from "Greek *bruso*, to eat." Dr. Brewer is described on his title-page as "of Trinity Hall, Cambridge." Obviously when at the Hall he did not devote himself to the study of the Greek language. It may be added that neither Dr. Brewer nor Mr. Robertson seems to have heard of an English writer named Peacock. On the other hand, there is plenty of such valuable and well-expressed information as this:—"Mephistopheles. A sneering, jeering, leering tempter. The character is that of a devil in Goethe's *Faust*. He is next in rank to Satan."

It is perhaps unnecessary here to discuss the desirableness of such a collection of snippings from classical authors (4) as Messrs. Jennings and Johnstone have set themselves to compile. It may be enough to observe that they have not shown much knowledge or judgment in their choice of translators.

The two volumes of the "Great Artists" series (5) now before us

(a) *A French and English Dictionary*. Compiled from the Best Authorities of both Languages, by Professors De Lolme and Wallace and Henry Bridgman. Revised, corrected, and considerably enlarged from the Seventh and latest Edition (1877) of the Dictionary of the French Academy. By Professor E. Roubaud, B.A., Paris. 116th Thousand. London, Paris, and New York: Cassell, Petter, Galpin, & Co.

(3) *Dictionary of Phrase and Fable, giving the Derivation, Source, or Origin of Common Phrases, Allusions, and Words that have a Tale to Tell*. By the Rev. E. Cobham Brewer, LL.D. Twelfth Edition, revised and corrected; to which is added a concise Bibliography of English Literature, by Eric G. Robertson, M.A. London, Paris, and New York: Cassell, Petter, & Galpin.

(4) *Half-Hours with Greek and Latin Authors*. From various English Translations. With Biographical Notices. By G. H. Jennings and W. S. Johnstone. London: Horace Cox.

(5) *The Great Artists—Albrecht Dürer*. By Richard Ford Heath, M.A. *Manegna and Frauncie*. By Julia Cartwright. London: Sampson Low & Co.

are well put together, and there is a great improvement in the illustrations as compared with the earliest volumes of the series.

Mr. Jerrold's useful little handbook (6) has the sub-title of "*A Concise Digest of the Laws regulating Copyright in some of the Chief Countries of the World, together with an Analysis of the chief Copyright Conventions existing between Great Britain and Foreign Countries*," and it may fairly be said to fulfil the conditions implied in this description. Mr. Jerrold, in all his statements of foreign law, has indicated the source whence he has obtained his knowledge, and the "place where the English reader will find it in the most intelligible form, should he wish to refer to another version of it or to the original." An appendix contains some account of the Conventions between Great Britain of the one part, France, Germany, and Spain of the other parts, the proposed Convention between Great Britain and the United States, and a brief sketch of the changes proposed by the Copyright Bill which Mr. Hastings introduced into the House of Commons.

Ladies who go in for what threatens to become the tiresome institution of bazaars and fancy fairs may possibly find some useful hints as to their management in *The Ladies' Bazaar and Fancy Fair Book* (7); but we cannot say anything in praise of the taste displayed in the illustration of objects which are supposed by the author to be suitable for sale.

Mr. Heath's name is warrant enough for the excellence of the little book on ferns (8) with which he has followed up his *Fern World*. It is worth while to note that, in a few lines prefixed to the volume, Mr. Heath invites all lovers of ferns to "assist him in his endeavour to make each subsequent edition more complete than its predecessor by forwarding to him data (accompanied by fronds) of the finding of any species of fern in any localities not indicated within the following pages."

Mr. Adamson has "done what a man can" by way of combining a *Life of Fichte* (9) with a kind of introduction to his system in a volume of some two hundred pages. Whether there is much gained by publications of this sort is another question.

Mr. Blakiston's *Early Glimpses* (10) is a capably devised little book, in the pages of which a child of an inquiring turn of mind is represented as learning in the most natural way, from conversations with his father and elder sister, some of the most important elementary facts of physical geography. The method is, of course, not new in itself, but it has seldom been employed more simply and more successfully. It is perhaps unlucky that the illustrations are of very varying merit. Some, especially those of fish, are decidedly good, while others cannot be praised, and one of a waterspout is extraordinarily bad.

From the same author we have the more advanced and equally admirable *Glimpses of the Earth* (11), of which the object is "to enable the young to take pleasure in acquiring, and at the same time to save teachers trouble in imparting, a knowledge of the earth's surface."

A new edition, beautifully illustrated by Mr. Alfred Parsons, has appeared of Mr. Robinson's *Wild Garden* (12). It may be convenient, for the sake of readers who may have forgotten Mr. Robinson's object, to quote the sub-title of the book, which runs thus:—"Or our Groves and Gardens made Beautiful by the Naturalisation of Hardy Exotic Plants; being one way onwards from the Dark Ages of Flower Gardening, with Suggestions for the Regeneration of the Bare Borders of the London Parks."

Mr. Stanford has brought out a new and cheaper edition for school use of the late Mr. Keith Johnston's *Physical and Descriptive Geography* (13). It has been necessary to omit the historical sketch, but the whole of the strictly geographical information has been retained.

A second addition has appeared of Mr. Morrison's *Historical School Geography* (14).

Mr. Bell has collected and republished a series of Geological Excursion Papers (15) which had already appeared in the *Glasgow Evening Times* and *Weekly Herald*. They have been revised and extended for republication, and may be found interesting by a wider circle of readers than that for which they were originally intended.

Mr. Burgess has produced a singularly full and detailed treatise

(6) *A Handbook of English and Foreign Copyright in Literary and Dramatic Works*. By Sidney Jerrold, of the Middle Temple, Esq., Barrister-at-Law. London: Chatto & Windus.

(7) *The Ladies' Bazaar and Fancy Fair Book; containing Suggestions upon the Getting-up of Bazaars, &c.* London: Ward, Lock, & Co.

(8) *Where to Find Ferns; with a Special Chapter on the Ferns round London*. By Francis George Heath. London: Sampson Low & Co.

(9) *Fichte*. By Robert Adamson, M.A. Edinburgh and London: Blackwood & Sons.

(10) *Early Glimpses*. Introductory to "Glimpses of the Globe," &c. By J. R. Blakiston, M.A., Author of "The Teacher," &c. London: Griffith & Farran.

(11) *Glimpses of the Earth*. Sequel to "Glimpses of the Globe," &c. By J. R. Blakiston. London: Griffith & Farran. New York: Dutton & Co.

(12) *The Wild Garden*. By W. Robinson, F.L.S. Illustrated by Alfred Parsons. London: The "Garden" Office. New York: Scribner & Welford.

(13) *The London Geographical Series—A School Physical and Descriptive Geography*. By Keith Johnston, F.R.G.S. Maps and Illustrations by London: Edward Stanford.

(14) *The Historical School Geography*. By Charles Morrison, M.A. London: Sampson Low, Marshall, & Co.

(15) *Among the Rocks around Glasgow: a Series of Excursion Sketches and other Papers*. By Dugald Bell, formerly Hon. Secretary to the Geological Society of Glasgow. Glasgow: Maclellan.

on the mystery of coach-building (16), much of which is of course somewhat too technical for the general reader. But the excellent "remarks on keeping carriages," at the end, should be read by all who keep carriages and care to keep them in good order.

Dr. Vines has prepared a second English edition of Dr. Prantl's "Text-Book of Botany" (17), with certain alterations, chiefly among which is the adoption of a different system of classification of flowering plants.

Ten years ago the curate of a fashionable church used to assert that, on the whole, he found "genius" and "yearning" the most effective texts for dinner-table conversation with the young ladies whom he was expected to entertain. Now he probably substitutes "sanitary" and "aesthetic." Mrs. Haweis tells us, in the opening paragraph of her pretentious-looking book (18), that "the appetite for artistic instruction is even ravenous," and that "the vacuum can be filled as easily as the purse can be emptied," because "just now every shop bristles with the ready means," and all at present needed to produce an elegant and refined home is the "cool power of choice." As much might be said of the facilities for making happy and suitable marriages, yet somehow discords still survive; but that may be owing to the absence of this valuable "cool power of choice." If the public for whom Mrs. Haweis takes the trouble to cater, and whom she facetiously addresses as "indolent lambs," have a digestion as strong as the ravenous appetite with which she credits them, and a power of assimilation equal to it, they may be able to find some "fine confused feeding" in this scrappy and often contradictory treatise. If they can buy a book with such a cover, they will probably enjoy the contents. At any rate, the originality of the style in which it is written will carry them on with the hope that some new ideas or useful hints may be embedded in the high-sounding periods or under such headings as "The Worship of Wreck," "Exquisite Obstructions," "Transparent Walls." Mrs. Haweis is very severe upon the slipshod people who class together the furniture used under the three Georges, Marie Antoinette, and Napoleon, and call it Queen Anne—a term, after all, only used for convenience, as we talk of the Renaissance; but she herself seems confused when speaking of the brothers Adams (*sic*) as contemporary with Inigo Jones, and in bracketting together Mr. Norman Shaw, Mr. Street, and Mr. (P) Gilbert Scott as Queen Anne architects. It is unnecessary seriously to review this conceited book, for the most part only composed of extracts, denunciations of nearly every style that has ever obtained, and a few recommendations, which, if carried out by the "indolent lambs," would inevitably lead to a trumpery incongruity in decoration, even worse than the tasteless efforts of the modern upholsterer.

A fifth part of *English Etchings* (19) is now before us. It brings out, with its predecessors, in a very strong light, the difficulty of printing etchings with any uniformity of effect. Artists who etch frequently assert that two impressions from the same plate are as different as two drawings by the same hand. In the case of the work before us, we are not tempted to use any such exaggeration, because we can only judge from one specimen of each design; but the three or four examples in each number are of such various degrees of merit, whether from difficulties of printing or deficiencies of original power, that, while a few seem to be of great excellence, the rest are only worth looking at once, if so often. In the new number we are glad to see a view of the old house of Sir Peter Pindar, in Bishopsgate Street, by Percy Thomas. It is in every way satisfactory, comparing for accuracy with the recent photographs, and for picturesqueness with any other print of the series. An interior, the entrance hall at Aston, is not so clear, and therefore not so interesting, while the striving after something like a Rembrandtesque effect is frustrated by the absence of any clear space of light. In a landscape, "Near Petersfield," the beauties, which are undeniable, are fully balanced by the faults. There is a fir-tree of the most delicately feathery character, and a sky which appears to be built up of big white stones instead of clouds. The critic is the more inclined to criticize because of the very ambitious and elevated aim of the artist, Mr. Snape, who has but just missed the production of a very fine work; but he has missed it. On the whole, however, this number is an improvement on those which have gone before, both from the greater excellence of the work and from the greater interest of the subjects. We are glad to observe that the publishers promise a series of views in old London, of which the Bishopsgate house is the first. There will also be commenced very shortly a series of portraits—no illustrated periodical can be said to neglect contemporary portraiture at present—the first of which will be an etching of the late Dean of Westminster, and the second one of Mr. Seymour Haden. On the whole, if we have found fault, it is rather because the work is worthy of criticism than from any wish to detract from the obvious merits of a very charming and, we must hope, very successful publication. It is, in fact, one of the most cheering signs of the revival of an interest in art that works like

these should be produced to attract the attention of the general public.

*Art and Letters* (20) seems to aim at becoming an English counterpart of an old favourite, *L'Art*. The illustrations are of the same character, and, apparently, for the most part from the same sources. The idea is an excellent one, for, though very few educated English men and women are unable to read French, many of them are unwilling to do so if they can get the same information in their own tongue. In a preliminary notice the editor of this new illustrated magazine remarks that the present fashion of engraving plates to accompany successive instalments of works of fiction affords but an inadequate representation of the higher claims of art; while of necessity, on the other hand, the few existing periodicals exclusively concerned with subjects of artistic study appeal only to a limited class of readers. This is undoubtedly true; but *Art and Letters* will need very high and sustained efforts indeed if it hopes to carry out so ambitious a programme. An attempt is to be made, so we are told, to satisfy a wider public, and to preserve, at the same time, a higher standard of artistic excellence. For this purpose a large portion of each number of the magazine is to be devoted to the consideration of the various forms of artistic production, ancient and modern; and special attention will be given to those forms of art which are connected with skilled industry. A chapter on the history of lace-making at Burano fulfils this promise so far as it concerns the present number. A large, but delicate, woodcut by Froment, from Hyppolyte Emmanuel Boulenger's "Brook," forms the chief illustration. Beside these features, there is a complete tale; and similar stories or novels are promised. Notices of Jean François Millet and Frederick Walker are charmingly written and profusely illustrated. There is a very picturesque view of the Arch of Augustus at Perugia; and the number winds up with some notes and news of "the several departments of art, literature, music, and the drama." We wish the new magazine all success, and gladly welcome another praiseworthy effort to bring the highest forms of art within the reach of all classes.

No reprint or collection of the works of any of our great men of letters should be more welcome than Mr. Matthew Arnold's edition of Burke's writings on Irish affairs (21). As Mr. Arnold justly insists in his preface, it is very far from being as easy as it ought to be to get the masterpieces of our prose writers. This collection will do something to supply the want as regards Burke.

Mrs. E. James (22) has written a very useful and handy-looking treatise on poultry-farming for Messrs. Ward and Lock's endless series of useful handbooks. Mrs. James writes for, and gives a great deal of good advice to, people who wish to make money out of their fowls.

Perhaps the people who want to keep the fowls would do well also to purchase Messrs. Ward and Lock's Handbook of Law in Domestic Matters (23), and then they will know what to do when the fowls are stolen.

Miss Ormerod will give them useful hints (24) how to escape the ravages of insects.

The pets of the children have a literature in their interest too. Boys who are addicted to the mild amusement of keeping rabbits may learn from a book published by "The Bazaar" (25) how to do so with the best results, and, we hope, also with the minimum of nuisance to other people.

(20) *Art and Letters*. No. 1. London: Remington & Co. October 1881.

(21) *Letters, Speeches, and Tracts on Irish Affairs*. By Edmund Burke. Collected and Arranged by Matthew Arnold. London: Macmillan & Co. 1881.

(22) *Profitable and Economical Poultry-keeping*. By Mrs. Eliot James. London: Ward, Lock, & Co.

(23) *Handbook of the Law relating to Matters of Domestic Economy*. London: Ward, Lock, & Co.

(24) *Manual of Injurious Insects*. By E. A. Ormerod. London: Swan Sonnenschein & Allen.

(25) *The Book of the Rabbit*. London: "The Bazaar" Office. 1881.

The work of each Chair will commence in January 1882. The stipend of each Chair will be £350 per annum, together with two-thirds of the fees, the total stipend being guaranteed to be not less than £400 per annum.

Candidates are requested to send in their applications, and copies of their testimonials, to the Honorary Secretary, not later than November 1, 1881.  
W. J. STEWART, Hon. Sec.  
35 Lord Street, Liverpool.

**UNIVERSITY COLLEGE, LIVERPOOL.**  
LECTURERS in FRENCH and GERMAN are REQUIRED, who will be expected to commence work not later than the middle of January next. The fixed salary will be small amount, but the Lecturers will receive the whole of the fees paid by the Students attending their classes, and will be at liberty to undertake Private Tuition.  
Applications, with testimonials, to be sent in by November 14, to the HON. SECRETARY of University College, 35 Lord Street, Liverpool.

**UNIVERSITY of LONDON.—PRELIMINARY SCIENTIFIC (M.B.) EXAMINATION.**—Instruction is given in all the subjects of the above Examination at GUY'S HOSPITAL, during the Winter and Summer Sessions. The Class is open to Students of the Hospital.—For further particulars apply to the DEAN, Guy's Hospital, Southwark, S.E.

**NO. 1AL SCHOOL OF SCIENCE and ROYAL SCHOOL OF MINES.**—The following LECTURES will be given in the Science School at South Kensington:—  
**BIOLOGY.**—Professor Huxley, F.R.S., will commence his Course of Lectures on Monday, Oct. 10, at Ten A.M.  
**CHEMISTRY.**—Dr. Frankland, F.R.S., will commence his Course of Lectures on Monday, Oct. 10, at Twelve noon.  
**METALLURGY.**—Professor W. Chandler Roberts, F.R.S., will commence his Course of Lectures on Monday, Oct. 10, at Ten A.M.  
**PHYSICS.**—Professor Guthrie, F.R.S., will commence his Course of Lectures on Monday, Oct. 10, at Ten A.M.  
The respective Laboratories were opened on the 3rd inst., at Ten A.M.  
The Prospectus and full particulars may be obtained on application to the REGISTRAR of the Normal School of Science, South Kensington.

**INTERMEDIATE EDUCATION BOARD for IRELAND.**  
EXAMINERS 1882.

THE INTERMEDIATE EDUCATION BOARD are prepared to receive applications from Gentlemen who desire to have their names placed upon the list from which the EXAMINERS in the several subjects for 1882 will be selected.  
Particulars as to remuneration, &c. can be had on application to the Assistant-Commissioners.  
Applications, endorsed "Examiner," should be sent in on or before November 1 next, addressed to the Assistant-Commissioners.

By Order,  
ARTHUR HILL CURTIS,  
T. J. BULLINGHAM BRADY, Assistant-Commissioners.  
1 Horse Street, Dublin: October 5, 1881.

**TRINITY COLLEGE SCHOOL, STRATFORD-ON-AVON.**—The Warden, RICHARD CURRY, M.A., is assisted by Seven Resident Graduate Masters, two being specially for Modern Languages. Special preparation for the Universities, Army, and competitive Examinations. Exhibition to the Universities of £20 per annum. Junior Department for Young Boys. Large Playing Fields, Gymnasium, &c. &c. Terms 50 and 60 Quodams.—Apply to the WARDEN.

**THE Rev. J. H. CROSS, M.A.,** receives a small number of GENTLEMEN'S SONS to prepare for the Public Schools. High testimonials. Great advantages.—Address, 31 Sussex Square, Brighton.

**MILITARY and CIVIL SERVICE EXAMINATIONS.**—There is a Department in connexion with BLAIR LODGE SCHOOL, POLMONT STATION, 34 St. Andrew's Road, for preparation for the above Examinations. Honours gained during the past year. Three appointments to Woolwich Academy. Seventh Place for Indian Civil Service. Full particulars on application to the HEAD-MASTER.

**MORNING PREPARATORY CLASS for the SONS of GENTLEMEN** (exclusively), 12 Somerset Street, Portman Square. The OCTOBER TERM commences Thursday Morning, October 6.

**PREPARATORY SCHOOL for SONS of GENTLEMEN.**—at LEONARDS-ON-SEA. Situation most healthy; sanitary arrangements perfect; cost of education very young Boys. References to Parents of Pupils.—For Addresses, Rev. W. HARRIS, Falkland House, St. Leonards-on-Sea.

**WOOLLEY GREEN, near HURSLEY, HANTS.**—A M. HEATHCOTE, B.A., Oxon. Coll., Oxford, prepares YOUNG BOYS for Public Schools, &c. Numbered Twenty. Two Resident Assistant-Masters. The house is quiet in the country, and in a healthy position. Full particulars on application.—Address, Woolley Green, near Romsey.

**TUITION at ST. LEONARDS-ON-SEA.**—A Married Clergyman (M.A. Oxon), without family, has vacancies for PUPILS to prepare for the Schools of the Universities, all former Pupils have passed successfully. Only Three given. Comfortable house a few minutes from the Sea. Highest testimonials.—Address, W. M. HOWLAND, 74, Cannon Street, St. Leonards-on-Sea.

**FOLKESTONE.**—Mr. W. J. JEAFFRESON, M.A. Oxon., assisted by a Cambridge M.A. and competent Teachers, prepares PUPILS for the Universities, Woolwich, Sandhurst, and all Competitive Examinations. A few Vacancies.

**EDUCATIONAL HOME for the DAUGHTERS of GENTLEMEN.**—THE GRANGE, Emsleigh, DONON-ON-THE-RHINE, Germany.—Number of Pupils limited to Twelve. Excellent English home. Resident North German and Parisian Governesses. High-class Masters for accomplishments. Unexceptionable references.—Apply as above, to the DIRECTRESS, Mrs. BARRETT.

**HIGH CROFT (near GODALMING).**—F for PUBLIC SCHOOLS. References to Marquis of Bristol, Lathams, Viscount Middleton, Sir D. Probyn, Sir Samuel Browne, house, &c.—Apply to Mr. ALDERMAN STEWART, M.A.

**TO THE VERY FEW PARENTS** in perhaps a million who possess sufficient intelligence to see that, in Education as in House-building, there can be no good superstructure over a poor foundation.

**MISS DICKSON, 39 North Bruntsfield Place, EDINBURGH.** seeks in any desirable quarter, under favourable circumstances, an opportunity of carrying on the EDUCATION of CHILDREN. This is the Adviser's chosen life-work, and she seeks a connexion with Parents who wish their children to receive individual attention from a Visiting Teacher who possesses unusually good vouchers of her ability as Educator. She believes that INVALID CHILDREN would derive especial benefit from this connexion; for, as she thinks, it is a mistake to deny children those impressive aids which are deemed essential in the Colleges. She educates through books, objects, diagrams, and pictures. Miss D. is accustomed to receive adequate remuneration.

**LADY B.** wishes to recommend very highly a SCHOOL on the South Coast, where her son has been educated for several years. The education given is thoroughly good, and the domestic arrangements are excellent. The Head Master is an Oxford M.A., and a Clergyman.—Address, Lady B., care of Mr. F. Golding, Bookseller, Minister Street, Reading.

**SEASIDE.**—A TUTOR, who takes a small number of Pupils, being desirous of adding at once to his numbers, will receive a few PUPILS (Sons of Gentlemen) at greatly reduced terms.—Address, Rev. C. D. H., 9 Salisbury Street, Strand.

**SECRETARY, CASHIER, or CONFIDENTIAL CLERK.**—An APPOINTMENT DESIRED by a GENTLEMAN, of considerable business, well accustomed to Book-keeping, Correspondence, and the Financial part of a moderate salary only required. The highest references can be given as to integrity and trustworthiness.—Address, H., 9 Villa Road, Epsom, S.W.

**TO NEWSPAPER EDITORS.**—An experienced CORRESPONDENT, for many years past engaged on a leading London paper, is willing to supply LETTERS or TELEGRAMS.—Address, OM Library, 208 Rue Rivoli, Paris.

**A RESPECTABLE COUPLE,** giving up housekeeping, would be glad to meet with a SITUATION of TRUST, town or country. A nobleman or gentleman with sailing or shooting box would find them capable of doing all required; have been in good families.—Address, J. M., 7 Bayham Street, Camden Town.

**HAMPSTEAD.—SOUTH HILL PARK GARDENS.** within five minutes of Hampstead Heath Station, N. London.—TO BE LET or SOLD, a Freehold Double-fronted HOUSE, containing fourteen rooms, also bath-room, with a constant supply of hot and cold water. Reception and Bed Rooms most conveniently arranged. Domestic offices on ground floor; good garden at the rear. The house is in thorough repair, and most pleasantly situated.—For particulars apply to Mr. DOLMAN, House Agent, 58 Ilaverstock Hill, and 90 Queen Victoria Street, E.C.

**TO BE LET, FURNISHED,** for a long or short term, a Lady's HOUSE, in South Kensington, within ten minutes' walk of Earl's Court and West Brompton Stations. Contains Dining and Drawing Rooms, Library, and five Bedrooms, and good domestic offices. Rent moderate.—Address, A. B., 35 Cathcart Road, S.W.

**TO BE LET, FURNISHED,** for Six Months, on the best part of Campden Hill (no opposite houses), a small HOUSE, prettily furnished; good Library. A Housekeeper left in charge. Rent 3 Guinea per week.—For Cards to View, and further particulars, apply to Messrs. ELGOOD, 21 Wimpole Street, W.

**HYERES.—TWO GOOD VILLAS** (Eleven and Six Bedrooms) TO LET. Best sanitary arrangements.—Address, S., English Bank, Hyeres.

**PENINSULAR and ORIENTAL STEAM NAVIGATION COMPANY.**

UNDER CONTRACT FOR HER MAJESTY'S MAILS TO INDIA, CHINA, and AUSTRALIA.

REDUCED RATES OF PASSAGE MONEY.—SPECIAL RETURN TICKETS.

Departures for—  
BOMBAY..... Weekly } From Gravesend,  
CALCUTTA, MADRAS, Ceylon, Fortnightly } Wednesday, 10.30 P.M.  
CHINA, FAN SHAN, & HANKOW, 3 times weekly } From Brindisi,  
ADELPHI, MELBOURNE, SYDNEY " } Monday  
GIBRALTAR, MALTA, EGYPT, ADEN, Weekly, by each of the } above departures.  
LONDON OFFICES: 125 LEADENHALL STREET, E.C., and 25 COCKSPUR STREET.

## HOTELS.

**BRIGHTON.—BEDFORD HOTEL.**—Facing Sea and Esplanade. Near the West Pier. Central and quiet. Long established. Suites of Rooms. Spacious Coffee-room for Ladies and Gentlemen. Sea-water Service in the Hotel. BENJN. BULL, Manager.

**ILFRACOMBE HOTEL.**—On the verge of the Atlantic, in its own Grounds of Five Acres, with Tennis Lawn, Contains 350 Rooms, and is a model of sanitary excellence. One of the largest Swimming Baths in England; also Private Sea-water Baths.—Every information of MANAGER.

**TOTLAND BAY, Isle of Wight, near Alum Bay.—TOTLAND BAY HOTEL.** Magnificent sea views. Comfort, with moderate charges. Billiard-room and tennis lawn. Bracing air. Excellent sands and promenade pier. Good anchorage for yachts. Special train and boat service, Friday, 2.10 P.M., Returning Monday, 7 A.M.—Apply to Miss FLEMING, Manageress (late of the Langham Hotel).

**"MACNIVEN & CAMERON'S PENS are a TREASURE."**

Just Out. Standard.  
THE "BIG J" PEN and THE "BIG WAVERLEY" PEN, 6d. and 1s. per box.  
Sold by all Stationers throughout the World.  
1,745 Newspapers recommend Macniven & Cameron's Pens.  
They come as a boon and a blessing to men.  
The Waverley, the Owl, and the Pickwick Pen.  
Specimen Box, all kinds, by post 1s. 1d.  
PATENTERS: MACNIVEN & CAMERON, 25 to 33 Blair Street, Edinburgh.  
Pensakers to Her Majesty's Government Offices. (Estd. 1876.)  
Beware of the party offering imitations of these Pens.

ORIGINAL DESIGNS, FAST COLOURS.  
From 2d. per yard.  
Patterns sent and Estimates given.  
C. HINDLEY & SONS,  
290 to 294 4th OXFORD STREET, W.

## DECORATION.

**MORANT & CO.,** having for many years carefully studied the best periods of Decorative Art, and having had great experience in carrying out important orders, will advise upon the DECORATION and FURNISHING of TOWN and COUNTRY HOUSES, prepare Designs, and execute the necessary works at moderate cost. MORANT & CO. personally superintend all work entrusted to them.

21 King Road Street, W.

## ARREST OF MR. PARNELL.

THE announcement made on Thursday last of the arrest of Mr. PARNELL had been long desired in the interests of law and order, but by most people was hardly expected when it came. How long the satisfaction now generally felt and expressed may continue undiminished it is impossible yet to judge. The Government must certainly be congratulated upon having at last done what they ought to have done long ago; yet the congratulations cannot but be mixed with reflections upon the dangers of tardiness. The special organ of Mr. GLADSTONE's Cabinet has indeed drawn from the fact that there is a general feeling that the arrest ought to have taken place sooner the curious and comforting conclusion that the Government has acted at the right moment. It must be admitted, however, that, when the thing was once determined upon, Mr. GLADSTONE lost no chance of making its announcement impressive. The PRIME MINISTER had previously made the outrageous assertion that the anarchy prevailing in Ireland was due to the cowardice of the landlords. The Government it was said, or implied, had done everything that could be done to preserve law and order, but was powerless in consequence of the apathy of the victims of lawless tyranny. But after this amazing utterance, and, in some respects unfortunately, also after an utterance of a different kind by Mr. PARNELL, it occurred to the Government that there was one thing which they might do, and which they certainly could hardly expect the landlords to do. That one thing was to arrest, not the subordinates, but the leader of the party of tyranny—"the man," as Mr. GLADSTONE said with an eloquence which was perhaps needless in the circumstances, "who has made himself beyond all others prominent in the attempt to destroy the authority of the law."

It is, we fear, an unfortunate accident that, while Mr. PARNELL's influence and teaching only led to the Boycotting, starving, and shooting of landlords, the carding of process-servers and of any tenants who dared to be honest, and the mutilation of horses and cattle, no special notice was taken of Mr. PARNELL, but that the necessity of arresting him became evident as soon as he put himself in a position of special antagonism to the Land Act. The coincidence has already been ungratefully made use of by Mr. DILON, and is not likely to be lost sight of. There was a certain *naïveté* in Mr. GLADSTONE's announcing at this stage of affairs that his Government, in ordering Mr. PARNELL's arrest, "had taken the first step towards the vindication of law and order, and of the rights of property"—the existence of which Mr. GLADSTONE has thus tardily and suddenly remembered; but, the first step having been at last taken, it is to be hoped that others will follow, and that the Cabinet will do its best to atone for its previous shameful vacillation. To have arrested Mr. PARNELL is to have done so far well, if it is not quite the feat of daring that it might be thought from Mr. GLADSTONE's appeal at the Guildhall for encouragement and support. But, Mr. PARNELL arrested, there remain others who are prepared to take his place and to make capital out of his arrest. The fact is that an organised scheme for destroying law and order, which might at one time have been checked with comparative ease, has been allowed to flourish and grow into alarming proportions. The beginning of its end has now been made, and it is to be hoped that the Government will no longer hesitate as to the course to be pursued.

## MR. GLADSTONE ON IRELAND.

THE concluding sentences of Mr. GLADSTONE's speech on Ireland were not ill calculated to invite a return of the confidence which all good subjects would wish to place in the Government. It would appear that prolonged toleration of crime and of lawless tyranny was only to continue until the Government had ascertained whether tranquillity will result from the operation of the Land Act. If at last they effectually discharge the plainest, though the most painful, of duties, Mr. GLADSTONE will be justified in his appeal to all orders and degrees of men to support the Government. He "relies on his fellow-countrymen in their three nations associated together, and he has not the least doubt of the result." The three nations, consisting of England and Scotland and the helpless victims of misrule in Ireland, would willingly rely in turn on the Government which can alone dispose of the national force. The Minister who has hitherto failed to protect the peaceable community wantonly insults the victims of oppression when he taunts them with their failure to defend themselves. A Government has no right to stand by while force is repelled by force. If Mr. GLADSTONE referred only to agitation and verbal protests, he might have remembered that a public denunciation of the Land League would be instantly followed by social excommunication, if not by violence or murder. Even for the Land League Mr. GLADSTONE has a good word, because one of its branches proposed to try whether its objects could be attained by the Land Bill. According to Mr. GLADSTONE the condition or occasion of the proposed restoration of order would arise if the Land Bill were, on trial, rejected by the Land League and by the tenantry under their influence. Lord DERBY, whom Mr. GLADSTONE quotes with the praise which an eminent convert deserves, has expressed his belief that "the land question, as regards Irish opinion, is not settled, nor in the least likely to be so." He adds that "if it were settled, its disappearance from the list of controversial topics would only bring on, in a direct instead of an indirect form, the claim which really underlies it, the demand for an Irish Parliament." Mr. GLADSTONE, concentrating as usual his attention on the object immediately before his eyes, implicitly encourages the demand for repeal or separation, while he pertinaciously insists on the immediate and grateful acceptance of the Land Bill. Lord DERBY, with cooler judgment, ridicules the expectation of gratitude. As he truly says, "fixity of tenure has been the direct result of two causes, Irish outrage and Parliamentary obstruction."

Although the Irish question was sufficiently engrossing to divert Mr. GLADSTONE's attention in the greater part of his speech from his customary attacks on his opponents, he could not refrain from expressing well-deserved disapproval of the conduct of a candidate who recently appealed to the Irish malcontents for the purpose of obtaining their support in the Durham election. The census was just, but it was like a denunciation of turbulence by the Government. Mr. GLADSTONE for the moment forgot, not only Liverpool and Salford, but the zealous support which, at the dictation of Mr. PARNELL, was given by his followers to Mr. GLADSTONE at the general election. The Irish voters in the great towns were then, as now, hostile to the English connexion, but nevertheless their aid in the agitation against Lord BRACONSFIELD's Government was gratefully accepted. The next topic on which Mr. GLADSTONE touched was the accumulation in the Irish Savings Banks

of deposits to the amount of many millions, "representing almost only the honest earnings and savings of the Irish farmers." The depositors are the same persons of whom Mr. GLADSTONE, for his own purposes, recklessly asserted that to them an eviction was a sentence of death. No inconsiderable part of their honest earnings consists of the rents which they have fraudulently withheld from the rightful owners. It was but an idle boast that crime, other than agrarian, has largely diminished. No other kind of crime is either so ruinous to the welfare of a community or more sordid in its motives. The criminal classes in a civilized country stand apart from the rest of the community and below its level; nor is any general demoralization produced by the existence of a limited number of pick-pockets, swindlers, and thieves. The great mass of the rural Irish population are willingly or by compulsion accomplices in acts of gross cruelty habitually practised for motives of plunder. The diffused contagion is worse than a disease which is isolated among a few leprous outcasts.

Mr. GLADSTONE's vituperation is so habitually directed against his Conservative adversaries that some relief was felt when he for once directed his indignant eloquence against a dangerous demagogue. Mr. PARNELL deserved all that the most fertile of orators could allege in his dispraise; but it was hardly necessary to point the invective by irrelevant eulogies on other promoters of sedition or enemies of the English Government and nation. In preparation for his attack on Mr. PARNELL, Mr. GLADSTONE exhausted the language of apology or of praise in honour of agitators, of Repealers, of would-be rebels, who had the solitary merit of not being associated with Mr. PARNELL in his depreciation of Mr. GLADSTONE's Land Bill. The Bishops of Ireland have, it seems, met "in solemn conclave" and advised the tenant-farmers to get as much as possible out of the lavish concessions which have been made to them by Parliament. The last time the Bishops met in solemn conclave they recommended, with an audacity worthy of the English Farmers' Alliance, that all or some of the members of the Land Court should be elected by household suffrage. The Archbishop of CASHEL is one of the most zealous supporters of the Land League, and he has taken an active part in its proceedings since the denunciation of the Land Bill by the League at the instigation of Mr. PARNELL. In his latest speech he impudently told the tenants that "whatever remained after making suitable provision for their families they might give to the landlord." A prudent statesman would not be tempted by momentary convenience to exalt the political authority of a body which may at any moment avow hostility to England. Sir C. G. DUFFY personally deserves the courteous language in which his support of the Land Bill was recognized; but he also is a zealous and consistent advocate of the disruption of the United Kingdom. A laboured contrast of Mr. PARNELL's policy with O'CONNELL's was, if possible, more injudicious than the appeal to the Roman Catholic Bishops. It is true that O'CONNELL for the most part recommended submission to the law, while, with a humorous leer, he informed the mobs which he addressed that he could drive a coach and six through any Act of Parliament. At the end of his career he brought Ireland to the verge of rebellion; and civil war would probably have broken out if his meetings had not been prohibited, and if he had not himself been cowed by the prosecution from which he afterwards escaped in virtue of a legal quibble.

Still more inexcusably extravagant was Mr. GLADSTONE's elaborate eulogy on Mr. DILLON. Next to DAVITT, no other Irish agitator has been more violent, nor, indeed, has he at any time cared to disguise his animosity to England. He shocked some even of his own faction when he apologized for the mutilation of cattle on the pretence that it was less criminal to torture dumb animals than to evict human tenants. Mr. DILLON now declines to stand in the way of any benefit which the Irish tenantry may derive from an Act passed exclusively for the promotion of their interests. He still retains the purpose of fostering the agitation which is now openly announced as the ulterior object of the Land League. It is easy to understand the temporary divergence of the courses respectively pursued by the leaders of the anti-English movement. Mr. DILLON thinks that it may be prudent to accept all that the law can give, in preparation for a further struggle. Mr. PARNELL probably fears that the

Land League may be to some extent disorganized by an intermission of its subversive operations. Mr. GLADSTONE can not only forgive, but respect and admire, the mere enemy of his country. The adversary who seeks to make his own favourite measure abortive is not entitled to similar indulgence. Mr. PARNELL was not slow to take advantage of Mr. GLADSTONE's reckless rhetoric. He asked his audience at Wexford to wait for a speech which Mr. DILLON was about to deliver before they judged whether he deserved Mr. GLADSTONE's praises; and Mr. GLADSTONE has not had long to wait for the natural result of his rash tribute to the merits of an implacable adversary. Mr. DILLON, to whose patriotism and prudence he has borne gratuitous testimony, now proclaims himself a steady follower of Mr. PARNELL, and expresses his entire concurrence in the policy which Mr. GLADSTONE denounced. The rebuff is well deserved; but a Prime Minister has no right to rest the national cause on arguments which admit of immediate and certain confutation. Nevertheless, caprice and inconsistency will be readily condoned, if it is confined to fallacious rhetorical contrasts. The Government will be forgiven its past derelictions of duty if at last it enforces respect for liberty, property, and law.

#### MR. GLADSTONE'S SPEECHES.

OF Mr. GLADSTONE's speeches at Leeds the most faultless and the most conclusive was that which he addressed to the Chamber of Commerce. The most brilliant speaker of the present day is also the greatest master of finance and of applied political economy. The feeble and fragmentary revival of Protectionist doctrines under a new nickname furnished him with a legitimate excuse, if not with an adequate occasion, for expounding in copious detail the enormous benefits which have been derived from the maintenance during the lifetime of a generation of the system of Free-trade. His demonstration of the advantages of buying in the cheapest market was so conclusive as to justify a reasonable doubt lately expressed by Mr. BAXTER, whether the adoption of Free-trade by France, Germany, and America might not tend to the disadvantage of the country which now enjoys a monopoly of the benefits of having renounced monopoly. In referring to his former prophecy that America would deprive England of commercial supremacy, Mr. GLADSTONE forgot that he had unnecessarily declared that he should not regret the change. Mr. GLADSTONE might well have omitted his reference to the casual influence of the Fair-trade cry on a few elections. Nothing would so effectually tend to consolidate the supremacy of the Liberal party as the perversion of any considerable section of the Opposition to the fallacies of Protection. In another speech Mr. GLADSTONE unjustly twitted Sir STAFFORD NORTHCOTE with the heterodox opinions of a member of his party who holds the rank of Privy Councillor. Mr. LOWTHER is too manly to disguise his convictions under a quibble about freedom and fairness of trade. At a late meeting he openly avowed himself a Protectionist, and advocated a five-shilling duty on imported wheat. The leader of his party is incapable of imitating Mr. LOWTHER's blunder, and he probably regrets the introduction of an element of disunion into the Conservative ranks. The groans for Sir STAFFORD NORTHCOTE which Mr. HERBERT GLADSTONE succeeded in eliciting from the large final meeting at Leeds may have been borne with more equanimity.

In the short speech in which he acknowledged his welcome to Leeds Mr. GLADSTONE professed satisfaction that even in that town there were some persons who were not of Liberal opinions. The division of political opinion is, as he added, one of the unvarying characteristics of a free country, "taken in common with the necessary condition of our imperfect faculties." The Opposition probably exists only because human faculties are not perfect. Mr. GLADSTONE, therefore, does not desire the extinction of the adverse party; and with this concession he exhausts his capacity of toleration. It is true that he confessed his own early connexion with the party, which was, as he explains, then led by Sir ROBERT PEEL and the Duke of WELLINGTON. He might have added that the Duke was a Tory of a type which is now obsolete, and that Sir ROBERT PEEL would have been startled by the doctrines now held by many of Mr. GLADSTONE's allies, and perhaps by himself. By an error of memory, Mr. GLADSTONE described himself as having belonged to the Liberal party for thirty-

five years, or since 1846. He forgot that in 1858 he canvassed the county of Flint for Sir STEPHEN GLYNNE as a supporter of the Conservative Government, and that in the following year he voted for the maintenance of Lord DERBY'S Administration. The inaccuracy has no practical importance; but, after an association of a quarter of a century with a political party, the language with which he almost always mentions it seems harsh and unbecoming. Because the Conservatives call themselves by that name, Mr. GLADSTONE always designates them as Tories, except when, in dealing with foreign policy, his animosity finds expression in the more offensive term of Jingoes. Sir STAFFORD NORTHCOKE, Sir R. CROSS, Mr. SMITH, and Mr. STANHOPE might perhaps expect a share of the indulgence which is accorded to Mr. DILLON, to Archbishop CROKE, and retrospectively to O'CONNELL; but the enemies of England and the opponents of the present Government seem not to be equally entitled to the exercise of political tolerance or generosity.

If the Liberals of Leeds were principally interested in the eloquence of their eminent guest, the country in general was more anxious to learn his intended policy than to criticize the language of any revelations which might be made. His declarations with respect to Ireland will be interpreted by his future action. It is at first sight not unsatisfactory to receive the assurance that he will not propose an Irish Land Bill for England or Scotland; but unfortunately the pledge would, if it became necessary, be explained away. The Farmers' Alliance Bill is at least as revolutionary as the Irish Land Bill, without any excuse for the scheme of spoliation which it contains. If it suited Mr. GLADSTONE'S purpose to promote the transfer of property from the present owners to claimants who might command more votes, he could prepare in ten minutes a speech of two hours in which he would prove that the application to Great Britain of the three F's was not made in conformity with the Irish precedent. His own prejudice against a class which includes extremely few of his supporters was strongly exhibited in his discussion of the question of local rating. As he truly said, a reduction of the rates, while it would afford immediate relief to the occupier, would confer a permanent benefit on the landlord. Consequently a demand for a readjustment of taxation "is a demand that the landlords of the country and their descendants shall to that extent be quartered on the public Exchequer." To be consistent Mr. GLADSTONE ought to refuse all concession to any part of the community which may be unjustly taxed. Any burden once imposed becomes, according to his novel doctrine, a perpetual charge on the part of the community which it affects, and if it is removed the sufferers are to that extent quartered on the public Exchequer. Twenty years ago the duty on advertisements had been recently repealed, and the gain had passed into the pockets of newspaper proprietors. Mr. GLADSTONE, instead of taunting them as incumbrancers on the Exchequer, was busily engaged in relieving them from the further burden of the paper duty. They have not since been stigmatized as public pensioners, though landlords whose rates may have been doubled within ten or five years may regard the tax as a perpetual charge on their incomes. In this, as in most other cases, Mr. GLADSTONE has two weights and measures for those whom he regards as friends or as adversaries.

In his latest speech, which was principally devoted to foreign and colonial affairs, Mr. GLADSTONE spoke with unqualified bitterness of his predecessors and their policy. He even accused the hated Tories of having wished to prevent the colonies from acquiring self-government, although successive Colonial Secretaries of either party have uniformly pursued the same policy. The only question relating to the colonies in which the country is at present interested is that raised by the failure of the Transvaal Boers to perform their engagements. There is no immediate disposition to criticize the conduct of the Government in commencing the negotiations. Mr. GLADSTONE, perhaps, could not be expected to satisfy public curiosity more fully than by the declaration that no further substantial concessions will be made—a declaration repeated with additional emphasis in his speech at Guildhall on Thursday. It was both unnecessary and unjust to censure the annexation of the Transvaal, as Mr. GLADSTONE'S colleagues formally approved the transaction, while the leader himself was silent. Mr. GLADSTONE'S reticence on the subject of the Egyptian complications was probably discreet. Diplo-

macy, if it is to be successful, must be secret; and it is impossible to know whether the reserve of the Government indicates a prudent resolve, or the absence of a definite policy. It was necessary that Mr. GLADSTONE should mention Egypt and the Transvaal; and, having transacted unavoidable business, he proceeded to gratify his own political antipathies by a wholly gratuitous disquisition on the Eastern question and on the Afghan war. Even at Leeds there were probably many Liberals who at the time concurred with an overwhelming majority of the House of Commons in preferring Lord BEACONSFIELD'S policy to Mr. GLADSTONE'S. His one-sided narrative of a series of complicated transactions can scarcely have convinced any but the most willing converts. His compassion for SHERIF ALI was not qualified by any mention of the Russian Embassy to Cabul; nor was the deliberate preparation by Russia of war with Turkey either blamed or noticed. There may perhaps be a few others who share Mr. GLADSTONE'S enthusiasm for "the heroic population of Montenegro." The increase of territory which those interesting highlanders have acquired was provided by the Congress of Berlin. It is impossible to reopen with profit European and Indian controversies which, as it was thought, had at last been concluded; but a thoroughly earnest statesman never forgives his adversaries, nor does he allow them the benefit of prescription. It may be hoped that they will not in excusable retaliation accept the obsolete issues which have been tendered by their implacable opponent.

#### ENGLISH POLICY IN EGYPT.

THE affairs of Egypt have naturally formed part of the subjects discussed by Mr. GLADSTONE, Lord SALISBURY, and Sir STAFFORD NORTHCOKE, and they furnished the only ground on which the rival speakers agreed. For once Mr. GLADSTONE found that Lord BEACONSFIELD had adopted a policy of which he thoroughly approved, and he announced that he and his Government would move strictly on the lines laid down for them by their predecessors. There were portions of Lord BEACONSFIELD'S Egyptian policy on which Mr. GLADSTONE would probably have passed an adverse criticism had he thought it necessary to notice them. But he confined his attention to the main result of this policy, and of this policy he generally approved. As this policy is henceforward to be the common policy of both parties, and may, therefore, be described as the policy, not of a Cabinet, but of England, it is well to have as clear a notion as possible of what this policy was. It was the policy of taking certain precautions under certain conditions for guarding the Suez Canal. The precautions taken were three, and were the purchase of the Suez Canal shares, the acquisition of Cyprus, and the intervention of England in the financial affairs of Egypt. The conditions accepted were that, through the International Tribunals, all Europe should have some kind of hold on Egypt, and exercise some sort of supervision over it; that France should share, on terms of equality, the intervention in the internal government of the country; that France should be allowed, so far as England went, free play in Tunis; and that the suzerainty of the SULTAN should not only be recognized, but should be used as a living and very effective force on appropriate occasions. On the first of the precautions taken, the purchase of the Canal shares, Sir STAFFORD NORTHCOKE made some just and striking remarks at Edinburgh. The purchase has turned out well in a pecuniary sense, but its utility is entirely independent of the market price of Canal shares. The real advantages which England gained by the purchase are of two kinds. In order to guard the Suez Canal we must have a canal to guard, a canal in good order, with well-managed traffic, and secured against the unfavourable influences of the elements. To keep the Canal in this state is the duty of the Company which made it, and by becoming the principal shareholder England placed itself in a position to see that this duty is properly performed. In every-day life there is an enormous difference between working from the inside and working from the outside, between guiding a Company to do what it ought to do and pressing its duties on a reluctant Company. It was to England very much what it would have been to Mr. PLIMSOLL if he could have got into the Board of Trade, when he would have been able to stop ships himself, instead of having to ring other people

up in the middle of the night to stop them. In the next place, the relations of England as the guardian of the Suez Canal towards other Powers are very much smoothed by England appearing as the chief shareholder of the Company. Otherwise England would always have been accused of bullying a poor little private Company, of talking of the Canal as if it belonged to England, and not to those who had put their money into the undertaking, and other States could have always found a pretext for interfering in defence of the interests of their subjects. France especially would have loved to patronize what was in the main a French Company. But it is by no means with France only that England would have had to deal. All Europe has been admitted to the privilege of seeing justice properly administered in Egypt, and any Power could at any time have complained of anything which it chose to consider an infraction of justice in Egypt. From these dangers, which no one with experience of Egypt would consider imaginary, England has been saved by the purchase of the shares. Not long ago Mr. GLADSTONE said that he did not see much good in the purchase of the shares, because, whether we had the shares or not, we must always trust to our navy to maintain us in our position of supreme guardian of the Canal. No doubt in extraordinary times we must trust to our navy. But we cannot be always sending ships of war and using force. It is in ordinary times—in times when we cannot use our navy, in the every-day relations of peace—that we really feel the beneficial influences of the purchase. But those beneficial influences are of a kind that may easily escape notice, because they are negative rather than positive. We escape worry, we escape awkward collisions, and our immunity from harm makes us forget that there was a harm from which we have been preserved.

While Sir STAFFORD NORTHCOTE dwelt principally on the first and third of the precautions to assure our guardianship taken by the late Cabinet, on the purchase of the shares, and on the good results of our financial intervention to the Government and the people of Egypt, Lord SALISBURY treated the second precaution, the acquisition of Cyprus, in a manner equally new and striking. He invited his hearers to look at the acquisition of Cyprus as a means of guarding the Suez Canal. Various objections have been made to the acquisition of Cyprus, some of which perhaps have not been satisfactorily answered; but there was one objection, that the acquisition was useless, which it will be difficult to make any more. If we look at the Canal, it is indisputable that England, with Aden at the one end and Cyprus at the other, occupies a position so commanding that no other nation has even the beginning of the means of rivalling it. These, then, were the precautions taken, and all were for their own special purpose prudent and effectual. But it must never be forgotten, that while England took precautions, she accepted conditions. As a shareholder she accepted the position of one who has a large interest, but who has to work with others who also have large interests. No practical difficulties, as Sir STAFFORD NORTHCOTE pointed out, have resulted from this; and the English directors have always been met with all the deference and attention they could ask. As the acquirer of Cyprus, England consented that she would put no difficulties in the way of the extension of French influence in Tunis—which merely meant that, as regards the Porte, England would not insist, in opposition to the repeated and consistent denials of France, that Tunis formed part of the Turkish Empire, and that England, as a Mediterranean Power, had no jealousy of any improvement of its position in Algeria which France might obtain by getting some kind of new hold on Tunis. Neither Lord SALISBURY nor M. WADDINGTON could have foreseen that the prize for which France was bargaining was the sad privilege of being allowed to stir up a fierce and bloody insurrection which 80,000 men have as yet been unable to subdue. As a controller of the Egyptian Government England had to admit France to an equal share in the work; she undertook to recognize the suzerainty of the Porte, and to concede to all Europe that it had a right to watch over what was being done in Egypt. That France was admitted to an equal share of the control was, as M. WADDINGTON thought, the great triumph of his Ministry. It was right to allow France to exercise this share in the control because it was unavoidable. The French were controlling Egypt, their money had made the Canal, they had been the great patrons of the KHEDIVA, their money

was largely sunk in Egyptian securities. There was nothing to do but to order them out of the country, under threat of war, or to work with them. When once co-operation had been agreed on, it was necessary that the co-operation should be loyal and frank. We are pledged to work with France in Egypt; and it is not for England, by petty manoeuvres, to shuffle out of any engagement she has deliberately undertaken.

We have little to do with Egypt except to keep the Canal in good order in times of peace, and to take care that nothing shall interrupt our free use of it in time of war. For these purposes we must have a good, orderly, equitable, and fairly strong Government in Egypt. Anarchy would be fatal in ordinary times to the Canal, which is very useful, but can be damaged with extraordinary ease. A bad weak Government in Egypt might offer an occasion for the intrusion of some Power which would gain a hold on the country that would be most inconvenient to us in time of war. We control the finances of Egypt not for the sake of the bondholders, but partly in order to prevent the peasantry being goaded into insurrection by oppressive taxes, and partly in order to stop the perpetual intervention through the Tribunals of the European Powers generally, to which the non-fulfilment by Egypt of its pecuniary undertakings would give an opening. We cannot allow the suzerainty of the SULTAN to be pushed to the point of military intervention, because Turkish troops in Egypt would seriously weaken our military position, and oblige us in every war to get Turkey as an ally, and because it would involve the establishment of the very worst Government that could be set up in the country. We have to work with France, and so long as France is above the suspicion of seeking secret advantages in Egypt for herself, we must work cordially and frankly with her. Recently things seem to have taken a favourable turn in Egypt, and up to this point they have been kept tolerably right by our adhering to the policy we have adopted. The Turkish Commissioners have been politely received, but they have not been allowed to assume any authority to interfere in the administration of the country, and they have shown an increasing anxiety to prove that they never meant to do any harm, and were chiefly charged with the duty of explaining to the disaffected soldiers that they had been guilty of a military crime. The despatch of an English and a French ironclad is supposed to mark that England and France are as much entitled as Turkey to interfere in Egypt. It may be a useful, but it certainly is not an important, step. The presence of ironclads belonging to other Powers will be equally a sign that England and France are not the only Powers that think themselves interested in Egypt. Much more important and decisive steps may have to be taken, but the time for taking them has not come, and there seems less immediate likelihood of their being necessary than there was some few weeks ago.

#### THE CONSERVATIVE LEADERS AT NEWCASTLE.

SIR STAFFORD NORTHCOTE described the contest of eloquence and invective that has been going on at Leeds and Newcastle as closely resembling a game of chess by correspondence. He himself opened the game, and made a safe, if not brilliant, move. Mr. GLADSTONE then made his attack, and managed to get forward an array of imposing pieces. For a day or two his opponents thought over their position, strove to detect all available points of attack, and made their great countermove at Newcastle. Every one, of whatever party, must own that they made it in an effective and even brilliant style. Lord SALISBURY said as many disagreeable things of the Government as could have been said in the time which he took to speak; employed language singularly clear, pointed, and polished; and never touched a subject without leaving his own special mark on it. Sir STAFFORD NORTHCOTE, though not attempting to rival Lord SALISBURY, felt the stimulus of having something to say which Mr. GLADSTONE's speeches afforded him, gained confidence from his inspiring reception, and was much more cheery and communicative than usual. It is impossible that Sir STAFFORD NORTHCOTE should ever eradicate from his mind that love of fairness which was born in him, and which prevents him from occupying the position, so advantageous to a denunciator, of seeing nothing but evil in his enemies. He augmented the esteem in which he is

held by those who are not violent partisans, but he lowered the tone of his speech, as a piece of party invective, when he paused to say, in words which seemed borne in upon him by a new tide of feeling, that he knew the Ministry had great difficulties to contend with, and that he was not disposed to judge harshly men striving to do their best in the hour of trial. In the main, the game was carried on according to the strictest rules of the art. The great secret is to leave out the strong part in the case of an opponent, and to bring out an opposite view as if it was the only one that a reasonable being could hold. Mr. GLADSTONE, as Lord SALISBURY observed, habitually regards persons who differ from him, not as erring human beings, but as positive lunatics. It is one advantage of these great tournaments of party orators in the provinces that the only effective answer to this method of annihilation by contempt is given in a way about which there can be no mistake. It may be added that these tournaments keep up political life in a way that in the present time is of great and increasing value. There is much more political activity in the large towns of the North than in London. Men there think and talk of political affairs with a much more lively and permanent interest than is found in the huge aggregation of the Metropolis. It is of great national importance that not only should the political activity of the provincial centres be well directed, but that its tone should be raised and its ambition quickened by the exhibition of what politics can be in the hands of those who master them. Mr. GLADSTONE and Lord SALISBURY sum up what their adherents would like to say, but cannot say. Their merits in their own line are of course different. Lord SALISBURY has not that marvellous power of arranging facts and awakening sympathy which gives Mr. GLADSTONE an unrivalled command over every audience he addresses. But, on the other hand, now that Lord BEACONSFIELD is gone, Lord SALISBURY is the only public speaker who can say things that stamp themselves on the memory of an audience and of the general public, whether those who cannot forget them agree with what is said or not. Mr. GLADSTONE has encouraged the Liberals at Leeds, and Lord SALISBURY has encouraged the Conservatives at Newcastle; but both have encouraged those who are anxious to see no decay in the scope and force of English political speaking.

It is the general result and not the various stages of political contests of this sort that it is profitable to notice. The combatants unavoidably lay themselves open to criticism. They omit, they misjudge, they exaggerate. Lord SALISBURY justly pointed out that Mr. GLADSTONE spoke of Afghanistan as if no such power as Russia existed. He himself affected to believe that Mr. GLADSTONE's announcement of more vigorous action in Ireland was more sermonizing, and would not wait two days to see whether the estimate was wrong. He dwelt with force and earnestness on the paramount duty of England to protect the natives in the Transvaal settlement; but he did not think it necessary to add that Mr. GLADSTONE had positively announced the intention of the Ministry to fulfil a duty which it heartily recognized. He was eloquent on the subserviency of Lord RAMSAY to the Irish voters of Liverpool, but was discreetly silent as to the subserviency of Sir GEORGE ELLIOTT to the Irish voters of Durham. Sir STAFFORD NORTHCOTE was strong on the evils of altering the rules of the House of Commons, on the pretext of obstruction, so as to make a Prime Minister despotic; but he did not allow his hearers to guess that it is not obstruction, but the cumbersome machinery of the House of Commons, which chiefly engages the attention of those who think, rightly or wrongly, that its machinery must be improved. He was loud in his gratitude to the Conservative members who on every occasion had uniformly supported Lord BEACONSFIELD; but he was filled with horror at the sad spectacle of the implicit obedience which Mr. GLADSTONE now commands. Nothing could have been more exposed to obvious and triumphant criticism than Mr. GLADSTONE's unfortunate statement that to lessen the burdens on land would be to quarter the landlords on the Exchequer. The only difficulty was to select the retort, and to give point by an effective instance to the general remark that other classes who are allowed to pay less in the way of taxation are never said to be receiving public bounty. But neither Lord SALISBURY nor Sir STAFFORD NORTHCOTE noticed the powerful remarks of Mr. GLADSTONE on the extravagance and recklessness which seem to follow with

unpleasant regularity on the grant of money by the State in aid of local expenditure.

The general result of the contest may, however, be separated from the contemplation of details, and the general result is of great value. It is, if simply put, that the Liberals have a case, and the Conservatives have a case, and the nation has to consider both these cases. It cannot be too often dinned into the national mind that when we speak of India we must not forget Russia; that landlords are as much entitled to consideration and justice as their neighbours; that the people will lose confidence in the House of Commons if, in its endeavour to reform itself, it abandons its power of checking the Government; that Protection is dead and buried. All these things are very familiar, and it was not possible that the speakers at Leeds or Newcastle should say much that was new about them. Perhaps it was with regard to Protection that the general public waited with most interest to see if the Conservative leaders had anything new to say. Sir STAFFORD NORTHCOTE had nothing new to say, except that he was altogether against a duty on corn; but he regarded it as a pious opinion, and not as an article of Conservative faith, that corn ought to be protected. This notion of pious opinions is no doubt convenient to a party leader, but it does not help us much in the controversy, if it can be called a controversy, as to Fair-trade. Lord SALISBURY was more definite and instructive. He had no shade of reticence in expressing his thoughts. To him the food of the people and the raw materials of the industry of the people were sacred. The pious opinion of Mr. LOWRICE that there ought to be a protective duty on corn was to Lord SALISBURY an opinion, very far from pious, that something he held sacred ought to be attacked. The only question that he could consider was the taxation that ought to be levied on luxuries. There is only one country from which we import luxuries, and that is France. Our imports from the United States and Russia are exclusively, or almost exclusively, of food or raw materials. From France we import luxuries, and especially silk and wine. Of silk as a protected article it is not necessary to speak, for what Lord SALISBURY urges is that it is quite permissible to tax French luxuries in order to get a reduction in the French protectionist tariff; and if the object were effected, any encouragement that was given to the English silk trade would disappear. The question of Protection does not, therefore, enter into the argument. Have we a right to increase the duty on French wine in order to force France to make a treaty of commerce? It is difficult to understand how any one can think we have not the right. Lord SALISBURY justly observed that this right is the very basis of a treaty of commerce. The essence of the bargain is that we give up taxes which it would otherwise suit us to impose in order to get the French to give up taxes which they say it would otherwise suit them to impose. If they will not make the bargain, we are where we were. We could with perfect propriety put any tax on French wine we pleased. Whether it would be wise to put on a higher duty than for our purposes we require is entirely a question of expediency, not of principle. We might put on this higher duty, irritate France, and not get a treaty with France after all. We might, without much friction, induce France to come to terms. The only use of a treaty of commerce under present circumstances is to get to the point at which Lord SALISBURY wishes to arrive without having to put on the screw, which, under other circumstances, he would like to see used.

#### THE CHURCH CONGRESS.

THE *Times* has taken a very peculiar view of the Newcastle Church Congress. According to our Mentor, that meeting "has dispersed after talking of many subjects" and thinking mainly of one. Mr. GREEN in Lancaster "Castle has been the central figure round which its meditations have revolved." Other observers have, on the contrary, been struck with the small place which the individual Vicar of Miles Platting has filled in the official sessions. Ever and anon a speaker would win his coveted cheer by a passing reference to imprisoned priests; but the debate, whatever it was, would recover itself and move on in its accustomed course. That which will make the Newcastle Congress conspicuous above all its predecessors

is the courage with which its managers selected for its bill of fare risky and burning questions—burning before the name of Mr. GREEN had passed his own narrow parish boundary—and appointed the most uncompromising men to discuss them. The result has been a Congress so harmonious and good-tempered amid strongly accentuated differences of opinion that the House of Commons might profitably take a lesson from this fortuitous gathering in the far North. A few years ago the successive discussion of Secularism and Spiritualism, of Ritualism, of the good and bad of Establishment, of the Ecclesiastical Courts, and of the principles of the Reformation would have been the lunatic programme of a clerical Donnybrook Fair. Now it has sent away the large assembly knowing more and thinking more kindly of each other than when they mustered on the banks of the Tyne. Several explanations might be offered for this result. The most obvious is that a Church Congress is after all a big school, where the boys behave the best when trusted and put on their honour. But this would be an inadequate interpretation of such a phenomenon. No amount of trusting could have ensured peace a few years ago over such subjects. The truth is that the idea of the Church as a corporate and historical body, in a sense unintelligible to Puritan particularism, has gradually taken possession of the English mind, and is now healthily affecting the discussion of ecclesiastical questions by men who have learned that reading and thinking are more excellent even than shouting. High Churchmen are, of course, most ready to apprehend the scientific and traditional definition of the Church. But the more intelligent representatives of the Broad and the Low parties have also grasped the fact to an extent of which they are themselves probably little aware. It is the law of all new tendencies to work underground till some sudden concurrence of circumstances causes them to break out into daylight. Such a concurrence was found in a Church Congress at last, and for the first time, held in the diocese of Durham. That important district of England had long been oppressed by the iron rule of a very earnest, but equally narrow and intolerant, bishop of the true Puritan stamp. Under Bishop BARING activity of thought and progress, except in the prelate's own direction, were inexorably banned. With the accession of Bishop LIGHTFOOT the pent-up waters found their vent, and the direction which they have been taking proves how futile for his own ends was the tyrannical policy of the preceding bishop. A meeting which had thought of nothing but Mr. GREEN would not have debated our actual ecclesiastical judicature in contrast with what it should be, in the spirit which marked the Newcastle debate.

Even the speakers who were set up to bless the present confusion had to fence their benedictions with admissions of desirable revision and probable amendments which notably diminished the value of their unskilful advocacy. We shall probably hear more of the rollicking denunciation of bishops and clerics in general as men devoid of the judicial mind, in which the Bishop of LIVERPOOL indulged, and which the *Spectator*—innocently accepting a misprint of the *Times*—attributed with much commendation to the peculiarly staid and cautious Bishop of LONDON. The debate on Ritual began well, and the home thrust so dexterously planted by the Dean of DURHAM when he argued that the copes which even the Judicial Committee has imposed upon bishops and Cathedral dignitaries let in the whole principle of a eucharistic dress, attached as they thereby are to the model and representative clergy of the model churches, must, at no distant period, make itself visibly felt. Illogical as the typical Englishman may be, the commonest instinct of justice between man and man is revolted at the sight of the bishop who does not wear the vesture which he is commanded to put on helping to send the parson to prison for putting on the vesture which that bishop believes that he is commanded not to wear. It is indeed remarkable that the prelates should be so slow to appreciate the moral advantage they would gain for the policy which they uphold by showing in their own persons a conformity to that which they proclaim to be the law. They may not like the cope as a dress, but it is surely as tolerable as pudding-sleeves.

The weakness of the contest maintained by the advocates of disestablishment in a discussion where they had not merely fair play but full swing, was very remarkable. One clergyman of pronounced democratic politics, who was their leader, could find no more forcible arguments than

to string together instances of oppression on the part of Churchmen in times when oppression was the law of existence for all bodies of Christians alike, and when all of them availed themselves of it without scruple whenever they found the opportunity of, as they believed, doing God service by crushing their opponents. Another clergyman, of considerable reputation as a sensational preacher, had the courtesy, on hearing some words of dissent, to tell the meeting that he was unable to frame to his own mind the intellectual condition of the poor creatures who would be content to leave the choice of bishops in the hands of a Prime Minister.

A practical turn was given to the goodwill of the Congress by an appeal to the company to make up the small sum still needful for the endowment of the see of Newcastle. It is certain that, in spite of the heart which Bishop LIGHTFOOT has put into the work, a cause which was before his episcopate rather powerful in inducing the men of Northumberland to look with complacency on a separation from their old alliance with Durham, has now disappeared. Still the practical necessity for the new see becomes every day more apparent with the increase of population; so we are glad to learn that it is within, not only a measurable, but apparently a very near, distance. More fortunate than Liverpool, Newcastle possesses an old church which may be turned into a cathedral—small, indeed, but still a possible and workable one; while its internal configuration is such as to make it easy hereafter to atone for deficient dimensions by dignified and beautiful decoration. The unusually wide wall spaces found in St. Nicholas' Church might be made a field for a mosaic treatment which would, if handled by competent artists, recall the glories of Ravenna.

#### MR. GOLDWIN SMITH AT DUBLIN.

MR. GOLDWIN SMITH'S remarkable address to the Economic Section of the Social Science Congress will have disappointed some of his political allies by its scientific impartiality. There is no reason to suppose that Mr. SMITH has modified the strong democratic opinions which he has held for many years; but he is not disposed to countenance semi-socialistic attacks on one among many forms of property. Ownership of land is, as he truly says, neither more nor less sacred than any other kind of ownership. If the public good requires that it should be taken from the present holders, or that their rights should be curtailed, they are entitled to full compensation. To the pretence that appropriation of natural forces is unjustifiable, he replies that all material objects, down to a coat or a pair of boots, derive their value from natural forces. His respect for Mr. MILL has not blinded him to the absurd injustice of confiscating the "unearned increment" which arises from the operation of causes external to the land and to the owner's improvements. The chances of increase or decrease of value formed part of the consideration for the original purchase-money; and, as Mr. GOLDWIN SMITH said, no one proposes to compensate the owner for an unearned decrement. Almost all titles to English land are older than the unearned decrement which has arisen from the recent importations of American corn and cattle. Of the present distribution of land in England Mr. SMITH probably disapproves; but uncompensated expropriation is, as he contends, a violation not only of property in land, but of property in general. The question was but incidentally connected with the main subject of the address. Mr. GOLDWIN SMITH undertook to explain the working of economic laws, not in the world at large, but in Canada and the United States. In those countries rent for land is seldom paid, as few estates are too large to be cultivated by the occupier. No controversy arises as to the right of owning land where no man has reason to envy the condition of a freeholder, because it can be acquired at a trifling cost.

Socialism on the American Continent is, according to Mr. GOLDWIN SMITH, of foreign origin. Mr. HERWORTH DIXON's communities are utterly obscure and insignificant, and their success and failure depend, not on their own particular theories, but on the simplest economic laws. Where celibacy is practised they thrive, sometimes resolving themselves into a kind of tontine, where the longest liver takes all the property. Those communities which become rich discourage the accession of new members, and the rest disappear like other insolvent associations. The more

serious socialism which is sometimes introduced by German immigrants takes no lasting hold on the country. Mr. GOLDWIN SMITH mentions the defeat of DENNIS KEARNEY's partially socialistic Constitution in California; and perhaps he scarcely attaches sufficient importance to the fact that such innovations could be even temporarily adopted in a flourishing and populous State. He is fully aware of the dangerous tendency of universal suffrage, if it were combined with any large amount of destitution. The most unsatisfactory element in the social condition of Canada and the United States appears to be the growth of pauperism. It may be hoped that American prudence and energy, disposing of vast natural resources, will be sufficient to suppress the evil. It is perfectly true that the agitation against landlords in Ireland has nothing to do with socialist heresies. The tenant, under the influence of his Land League orators, his priests and bishops, wishes to perpetuate the institution of property in his own person. As Mr. GOLDWIN SMITH humorously said, a socialist emissary who proposed to a peasant that his land should belong to the State would be met by arguments which would penetrate the thickest skull.

The portion of the address which was devoted to criticism of schemes for tampering with currency has happily little practical application in England. The crotchets of the Birmingham note-monger of the last generation were finally exploded by Sir ROBERT PEEL, and an overwhelming preponderance of authority is opposed to the more novel delusion of bimetallism. In the United States unsound doctrines have been propagated and practised, not so much as a result of sophistical arguments, as for the advantage of public and private debtors who took opportunities of defrauding their creditors. Mr. GOLDWIN SMITH denounces in strong language the Legal Tender Act of 1861, and the judgments of partisans on the bench of the Supreme Court who for political reasons affirmed the validity of an unconstitutional law. To the apologetic argument that the issue of inconvertible paper money was indispensable to the public safety in a time of imminent danger, it is a sufficient answer that the money might have been borrowed in the open market, instead of being unequally levied by a process which was equivalent to a forced loan. "In England commerce has a firm control over currency legislation; in the communities on the other side of the water it has not so firm a control, and tampering with the currency is the demagogue's favourite game." Proposals for cheating the public creditor by paying the National Debt in greenbacks seemed for some years after the war not unlikely to succeed. Mr. THADDEUS STEVENS, General BUTLER, and other popular leaders strongly advocated the fraud; and President ANDREW JOHNSON caricatured their proposals by contending that the debt should be cancelled as soon as the accumulated interest had become equal in amount to the principal. At one time the House of Representatives voted by a majority of nine to one for the payment of the debt in greenbacks. The intervention of the Senate saved the Republic from intolerable disgrace. The more recent device of bimetallism was due to the ingenuity of owners of silver mines. Both Houses of Congress passed a law for the purpose of making silver legal tender at a rate far exceeding its real value. The Executive Government has hitherto contrived to hamper or evade the operation of a discreditable law.

It would be both useless and invidious to offer a summary of an essay which is as lucid in style and arrangement as it is sound in economic theory. On some minor points just or plausible exception might be taken to Mr. GOLDWIN SMITH's propositions. He says that the land ought to be made to bring forth as much food and of as good quality as possible. The doctrine, which is often propounded by agrarian agitators, requires an important limitation. It is neither a duty nor a meritorious enterprise to exhaust the capabilities of land, unless additional produce can be obtained at a profit. In prosperous times high farming is generally profitable, though beyond a certain point an addition of artificial fertility is wasteful. Within the last few years the most elaborate cultivation has been the most disastrous to the farmer, who, if he could have foreseen the circumstances in which he would be placed, would have done better to hoard his capital than to expend it on the land. It is scarcely accurate to speak generally of Belgian peasant farmers as prosperous freeholders. A majority of their number pay rents which would be deemed extravagant in England, and their incessant labour is rewarded by scanty profits and an insuffi-

cient livelihood. Mr. GOLDWIN SMITH elsewhere adds his authority to a favourite doctrine of Mr. GLADSTONE's, that "idle wealth, whether it is possessed by a landowner or a capitalist, is an evil to the owner and the community." In this sense all wealth, large or small, is idle, inasmuch as it is enjoyed without the condition of labour. A rich man is often industrious in politics, in philanthropy, in literature, in science, or even in the management of his estate. For his own bodily and mental health he does well not to be idle; but his energy is independent of his wealth. Several English magnates might be mentioned who work as hard in the administration of their property as if they were dependent on their industry for subsistence. As far as the rest of the community is concerned, the same duties might be as advantageously discharged by a land agent who would secure a small percentage of the ducal revenues. All property, down to accounts in savings banks, is in the same sense idle, although it furnishes the chief motive power of the industry of the world. There may perhaps be an advantage in the American social arrangements which, by interposing difficulties in the way of expenditure, incline rich men to make large donations for public objects. The necessity of guarding against the tenure of too much property in mortmain has probably not yet arisen. In England rich men are too often idle; yet many of them discharge with great advantage to the community unpaid public functions. A wholesome feeling or prejudice is opposed to the practice of living, as many French *rentiers* live, without employment, on small incomes. A young man who is content to vegetate on two hundred a year, without attempting to better his condition, commands neither respect nor influence.

#### ROME AND THE POPE.

THE Paris correspondence of the *Times* contained on Tuesday a remarkable description of the political situation in Italy. Even if we had not the assurance of the Correspondent who sends it that the statement comes from "an eminent Italian, who has rendered United Italy 'immonse service, who has made himself famous in 'divers ways, and whose patriotism or authority cannot 'be suspected,' it would well deserve consideration. Rome, says this politician, is the most detestable capital that Italy could have chosen. She had no choice but to take it when she did, but it is now as necessary that she should leave it as it once was that she should enter it. So long as the Italian Government remains at Rome it alone of all the European Powers must have the Papacy for its foe. While Pius IX. lived, Italy shared this distinction with Germany, with Russia, with Austria, with Turkey. Now she enjoys it alone. Leo XIII. has become, or is in a fair way of becoming, friends with every one else; it is only with Italy that he is not and cannot be reconciled. If this conflict ends in the defeat of the POPE, it is not the Italian Monarchy, but the Italian Republic, that will reap the fruits of victory. The House of Savoy is identified with a solution which aimed at making the two Italian Governments friends, and on the day when this solution is finally proclaimed to be a failure the Italian Revolution, which compasses the overthrow of both, will be master of the field. All that stands in the way of a solution which would make the House of Savoy stronger than ever, and give Italian unity under a monarchical Government a new and powerful supporter, is Rome. "When we have recovered a more natural, a more logical, more central, more approachable, a less sombre and a less unhealthy capital, all that now impedes and threatens us will disappear at once. . . . Italian unity will be cemented by the tacit and satisfied adhesion of the Papacy," while the Papacy, knowing that any revolution would destroy that work of conciliation, would be the most powerful ally of the kingdom in which she would have reconquered her independent seat."

It is difficult to believe that in a society so permeated by revolutionary fanaticism as Europe is to-day such counsel as this can have a chance of being listened to. It is something, however, that sensible Italians should no longer conceal from themselves how impossible it is to make head against the Revolution if the greatest of conservative forces has to be fought at the same time. The Italian Conservatives are cut off from the very

elements which in almost every other country constitute their strength. The clergy are hostile, the peasantry are at best indifferent. The Conservatives dare not make the monarchy popular by enlarging the electorate, because they cannot feel sure that the first act of the newly-enfranchised voters would not be to return Clerical candidates. Consequently they are compelled to remain a minority in the Chamber of Deputies, unable to exercise any influence on the course of affairs, except when the various sections of the Radicals happen to fall out among themselves. While Pius IX. was Pope there was no possibility of putting an end to this state of things. For Pius IX., in his later years, was, before everything else, a Legitimist. He had convinced himself, or had been convinced by others, that the cause of the Church was bound up with the cause of deposed royalty all over the world; and, before he would have made friends with what he was pleased to call the Subalpine Government, that Government must have broken up Italian unity and replaced the dispossessed princes on their several thrones. Even if he had consented, under the inducement of an overpowering ecclesiastical advantage, to condone the secular robberies of which the Italian Government had been guilty, he would never have admitted their right to a single yard of Pontifical territory. It would have been useless to offer him an ecclesiastical capital; he would only have seen in such a proposal the first step towards a complete restitution. With a Pope whom nothing could induce to listen to reason, negotiation or compromise was out of the question. He might prove to have it in his power to give the Revolution a triumph over his adversary as well as over himself, and to involve the Italian Kingdom and the Papacy in a common disaster; but he would not forego his exercise of that power on any terms which it was possible to concede. The accession of what we may call a Whig Pope changed the whole face of affairs. LEO XIII. has made no overtures to the Italian Government, because up to this time there has been nothing to show that such overtures would receive the consideration due to any suggestion of truce made in the course of a civil war. But there can be little doubt that he would willingly, and even gladly, make such overtures if he thought that any good could come of it, and would still more gladly welcome them if they were made by the Italian Government. His relations with the French Government have shown how unwilling he is to be on bad terms with the secular authorities. He had every provocation to a quarrel given him if he had cared to take it, and in refusing to take it he ran very grave risk of offending and alienating an influential section of French Catholics. We may be sure, therefore, that LEO XIII. would not maintain his present attitude towards the Italian Government if that Government were to give him a sufficient earnest of its wish and intention to live at peace with the Papacy. The most obvious way in which such an earnest could be given would be to relegate Rome to the position which naturally belongs to it, and to make it once more the ecclesiastical capital, not of Italy only, but of the Roman Catholic world. This is the one sacrifice which would satisfy LEO XIII., but with this there is much reason to believe that he would be content. The POPE might then exercise within the precincts of the city of Rome the sovereign authority which he now exercises within the precincts of the Vatican, and yet no one be substantially the worse. Some few municipal ambitions might be blighted, but that would be all. The Romans who wished to make a career for themselves in the public service would follow the Government to the new civic capital, and would, no doubt, find there the career which they had once thought to find at Rome. The Roman tradesmen would probably welcome the change. The custom of a migratory Court must be a poor exchange for the custom of the Roman Catholic world; and the last municipal elections seemed to show that the contrast between the liberal promises given by the party in power and the actual performances of that party has not been without its influence on the practical Italian mind.

No doubt, as the writer of the statement in the *Times* observes, the cosmopolitan revolutionists would hotly oppose any such compromise; and the despotism which in Italy, as in France, leads politicians and Governments to succumb to the cosmopolitan revolutionists upon every opportunity might make their opposition formidable. Prince BISMARCK might effect such a reconciliation in

Germany, and CAVOUR, were he alive, might effect it in Italy; but the extremely feeble politicians who have at present the affairs of the country committed to them can hardly be expected to do anything of the kind. Whether the idea of leaving Rome which has of late been attributed to the POPE has really been entertained by him cannot be said with any positiveness; but it is obvious that he has in this idea a very powerful weapon as against his adversaries, however dangerous it might prove in the long run to the Papacy itself. It is impossible, however, to form even a guess of the use to which LEO XIII. may put this weapon. He may be unwilling to irritate the Italian nation by transferring the seat of the Papacy to another country; or he may think it expedient to let the Italian nation see that he is not to be trifled with beyond a certain point, and that if the conservative forces of Italy are to make common cause against a common enemy, the time has come when the secular power must make advances to the spiritual power. The Papacy, under the guidance of LEO XIII., is not likely to act rashly; but it will not be surprising if, in the end, it should act with more decision than the Italian Government seems to anticipate.

#### THE GREAT GO-BETWEEN.

THERE can no longer be any doubt as to who really sways the destinies of Europe. The fact was revealed to an astonished world on Wednesday. The *Times* has a Correspondent at Paris, and it is this Correspondent who moves the secret springs of peace and war throughout the civilized world and who has doubtless been the unrecognized channel of negotiation in the change of ministry just announced. Until now he has been content to hide his light, so far as this delicate and unacknowledged part of his functions is concerned; but, at the report of an impending interview between Prince BISMARCK and M. GAMBETTA, his feelings became too many for him, and he hastened to write two columns and a quarter about a conversation which he had in July 1878 with Prince BISMARCK. This was the more noble of him, inasmuch as he begins by saying that he has "on former occasions been twitted with putting so much material into a single interview; but," as he explains, "in the course of four hours a man like Prince BISMARCK, especially when in a communicative mood"—and to whom should he be communicative, if not to a personage of this importance?—"says a great deal that an attentive listener may well impress on his memory." The first thing impressed on this attentive listener's memory was that the PRINCE smoked a long pipe, and, like Mrs. WITTICALLY, talked on a variety of topics. Presently M. GAMBETTA's name was mentioned; and "GAMBETTA!" exclaimed Prince BISMARCK, "That is a man I should like to see before I die. . . . I am told he is bewitching. Yet it is said men who are bewitching are never great statesmen." Here was an opportunity for one of those graceful *mots* which, when uttered by the truly great, become historical. "M. THIERS once told me," I interposed, "that your Highness was bewitching, yet you pass for a great statesman." It is the judicious sprinkling of such pleasing conversational touches as this that lends a charm to the recital of even such grave affairs of State as the Paris Correspondent of the *Times* burdens himself with. Presently Prince BISMARCK repeated that he would like to see M. GAMBETTA before he died, and soon afterwards the Correspondent, left alone with Prince Hohenlohe and Baron HOLSTEIN, arrived at a conclusion, which he put into words. He could not imagine that the PRINCE spoke twice by pure chance of his desire to see M. GAMBETTA. Prince BISMARCK knew that the Correspondent was acquainted with, among other distinguished people, M. GAMBETTA. "He did not tell me not to repeat what he had said; he emphasized his 'praise of M. GAMBETTA as though' (the italics are ours) 'to entrust me with a polite message.' But a natural courtesy prompted the Correspondent to offer Prince Hohenlohe, as a more intimate acquaintance of Prince BISMARCK, a share in the delicate negotiations thus suggested; and Prince Hohenlohe, 'as usual when struck' by a suggestion, looked down on the ground, and after a moment's silence looked up smiling and nodded approvingly." Baron HOLSTEIN also agreed that "we ought to arrange the interview," and was about to discuss ways and means, when it suddenly struck the *Times* Correspondent that he ought not to be precipitate.

and he terminated the audience which he had given to Prince Hohenlohe and Baron Holstein in, it must be admitted, a somewhat crude fashion. "It being now 11 o'clock, I looked at my watch as a sign that I had 'other duties'; and upon this royal intimation Prince Hohenlohe of course made his bow and went away.

Naturally enough, the *Times*' Correspondent could not sleep that night for thinking of the burden laid upon him. The issues of peace and war between two great nations were virtually committed to his hands; but he was not above taking counsel with lesser men than himself, and twenty-four hours later he saw Baron Holstein again, knowing "that he must have reported to the CHANCELLOR 'what I had said; must have heard his views, and that 'what he would tell me would be what the CHANCELLOR 'thought.' The BARON, it seems, admitted that the Correspondent was right in his view of the situation; but this general point settled, he entered into special "considerations which I religiously committed to memory, "for they evidently set forth the preliminary conditions "of the interview." Then follows a passage which shows what a wonderful memory the *Times*' Correspondent must have, but about which there is one unsatisfactory point. The last sentence of the religiously-committed-to-memory speech runs thus:—"But a meeting between two men "with peaceful intentions, and imbued with the duties "devolving on them, may bear salutary fruits, even if they "renounce the personal satisfaction of triumphing over "each other." Now the whole story of the *Times*' Correspondent is nonsensical enough, but it will be seen that in this sentence there is a special kind of nonsense due to the italicized words, which clearly ought to read "especially if." Without conjecturally emending the passage mistranslated by the *Times*, we may suggest that the German word *eben* and the English *even* have some resemblance. It may be that there should have been a break at "salutary fruits," and that the sentence went on interjectionally—"Eben—ja! Wenn "Sie, &c." Yet more remarkable is what we find a little further on. After having listened to and religiously committed to memory what Baron Holstein had had to say, the Correspondent set himself afresh to think over his great mission. "Without thinking of the possibility "of a negotiation or compromise, or of any such thing, I "remembered that the CHANCELLOR had declared to me "that he had only yielded to imperative reasons, urged "by Count Moltke, in demanding Metz and Lorraine." Here, surely, the great personage's memory has played him a little false. That Prince Bismarck is in the habit of making a kind of confessor and ambassador rolled into one of the Paris Correspondent of the *Times* there can, of course, be no doubt; but that he spoke of demanding Metz and Lorraine—which is as if he should speak of Leeds and Yorkshire, or Brest and Brittany—can hardly be admitted. No doubt, however, the magnitude of the affair must be remembered as an excuse for any trifling slip in the detail of the recital. Prince Bismarck, we are told, "seemed just then really animated with the best of "feelings towards France—that is, of course, in so far as "is possible with him." He spoke of her "with grave "moderation," and even paid a condescending compliment to the French Ambassador. The Correspondent's "mind was made up from that moment, and I "determined to enter upon that serious and delicate "negotiation." This was a lofty resolution, but unhappily, as we presently see, nothing came of it. Even the Paris Correspondent of the *Times* may be overcome by *force majeure*. He called upon M. Gambetta as soon as possible, meaning to broach the great subject. "But this was "impossible at the first interview." The Correspondent had just returned from the Berlin Congress, and of course M. Gambetta was anxious to listen to his words of wisdom on that matter, and to nothing else. Having listened, he "summed up with his usual vigour the impression he "had received." More than this, "he spontaneously "authorized me to quote the summary on which I had "congratulated him," and it actually appeared in the *Times* and was reprinted by M. Gambetta's express orders in the *République Française* without comment. "I "quitted M. Gambetta without hinting what my object "had been, but announcing a second call." At this second call he plunged boldly into "that serious and "delicate negotiation." Meanwhile Prince Hohenlohe had returned, and was told by the Correspondent that M. Gambetta seemed inclined to the scheme and

"had set me at ease as to the possibility of secrecy." The CHANCELLOR was to stay another fortnight at Kissingen, and "Prince Hohenlohe asked me to see him two "days later, to resume the negotiations."

Now comes the tragic part of the story. The Correspondent is, after all, we learn with grief, a creature of human weakness, though it must be remembered that it is not every man in high place who has the moral courage to make free confession of his weakness. When the secret meeting was first mooted he was, it will be remembered, carried away by enthusiasm, presently checked and tempered by that diplomatic judgment which led him to look at his watch and dismiss Prince Hohenlohe. Then, in a calmer spirit, he entered upon his arduous task; and, as soon as he had heard Prince Bismarck speak politely of the French Ambassador, he hesitated no longer. He went straight to M. Gambetta, and, as soon as M. Gambetta would let him, revealed his great and glorious mission. On the one side, M. Gambetta was well disposed; from the other, Prince Hohenlohe came to beseech his intervention, and this time no watch was significantly looked at. Everything seemed well in train for the momentous interview which the *Times*' Correspondent had undertaken to bring about. But now was exemplified that uncertainty of human affairs which poets and historians have ever been wont to celebrate. In the very hour of triumph a cold fit once again seized the Correspondent. When he felt that the negotiations might soon come to something, he also "began to feel "uneasy. I reflected that any slip during that interview "might have the gravest consequences." He pictured to himself Prince Bismarck as he had seen him, and he found that the picture was not "bowitching." The Correspondent has, he tells us, and the assurance is comforting, "for years been able to treat with disdain "all the calumnies that have been aimed at me"; but he quailed before "the responsibility which might devolve "upon him in such an affair." He would face the raging of the seas, but not an angry Chancellor. Careless of the shafts which envy might aim at him, he executed a masterly movement in retreat. "I excused myself to "Prince Hohenlohe, did not return to M. Gambetta, and, "the CHANCELLOR having left Kissingen, I thenceforth "considered myself as unconcerned in the scheme." So ends this curious and instructive page of contemporary history. Its recital in the pages of the *Times* may seem for the moment purposeless, but possibly the future may throw some light upon the narrator's motives. Meanwhile it is at least a privilege to have learnt to whom to look for help and encouragement in European complications.

#### BRITTANY.

IT is now nearly forty years since the appearance of M. Emile Souvestre's well-known work, *Les Derniers Bretons*, and the picturesque and interesting article on it by Mr.—now Dean—Church in the *Christian Remembrancer*, afterwards republished in his volume of *Essays and Reviews*, not to be confounded with the ill-starred work which appeared some years later under the same title. In its outward features, both natural and architectural, the country remains, of course, much what it was, but this scarcely holds good of its moral peculiarities. The simple *pietas* and *prisca fides* which then looked to the traveller like a mediæval survival has lost something already from the closer contact induced by railways, newspapers, and other modern appliances with the civilization of an uncourteous present. It can no longer be affirmed with any literal exactness that "a couple of days"—we may now say twelve hours—"off from Paris or Southampton we may reach a race of men more difficult to piece on to modern society than those who live by the Nile or the Ganges, or sell one another beneath the Liane." No doubt, as we stand in the *Champ des Martyrs* near Auray, or under the gloomy walls of the *Salorges* at Nantes, converted into a temporary prison, when, according to the brutal jest of the infamous Carrier, "*le décret de déportation a été exécuté verticalement*," and some 9,000 persons were destroyed in the course of three or four months, we may reflect that, in spite of treacherous massacres of royalist soldiers, and the wholesale drowning of men, women, and children in the hideous *noyades*, the Bretons still to a great extent "believe in their priests." "Pontivy" has outlived the fanatical attempt to rechristen it Napoleonville; "the cross is everywhere" still—or oftener the crucifix—at the cross road, on the moor, at the end of the village street, by the churchyard gate; the marvellous Calvary of Plougastel, though somewhat marred in its details, retains its quaint solemnity; and the beautiful church of Notre Dame de Folgoët still preserves the memory of Salaun, the canonized idiot lad, from whose neglected grave there sprouted the miraculous lily plant with his only recorded utterance, *Ave Marie*, inscribed on every leaf. Brittany was shown at the last

elections to be the one corner of France where the monarchical sentiment retains its power; and there are still whole regions there, out of the towns, where few of the men, and none of the women, understand a word of ordinary French. But, nevertheless, there is a perceptible difference. It is e.g. a rare exception in the Tyrol to see a peasant pass the wayside cross or frescoed shrine without doffing his cap; in Brittany, where the crosses are quite as frequent, it is almost as exceptional to see any passer-by take the slightest notice of them. The churches are open all day, but during the greater part of it their silence is only broken by the almost "invariable ticking of the clock" or the clattering sabots of the two or three old women who are usually to be found there; it is fair to add, however, that there is a considerable attendance in the early mornings even of weekdays, while on Sundays a large number of men may be seen at the low masses, though comparatively few are present at High Mass or Vespers. But it is clear from many little signs that the old devotion, or superstition, or simplicity, or whatever we please to call it, is gradually dying out. The departed spirits no longer appear on All Souls day in the Bay of Trépassés—where the vast and wicked city of Ys, "the modern Sodom," sunk under the avenging wave—and even "mysterious Carnac," as our readers may have gathered from the work of Mr. Miln reviewed the other day in our columns, is compelled to submit its mystery to the realistic handling of archaeological research. The schoolmaster is abroad even in Brittany, and the bright intelligent boy, who acts as your cicerone to the curious dolmen called the "Butte de Oésar" at Locmariaker, is as much at home in French as in his native Breton tongue, and will tell you of brothers of his who are also adepts in English. We are by no means disposed to endorse the sweeping indictment brought by some English sojourners in Brittany, that "all the men are atheists," which at most is only true of a portion of the upper class, but there is too much reason to fear that a great many of them are at least occasional drunkards, and it is certain that the English tourist has taught them to keep a much sharper eye on their gains than formerly, though the general cost of travelling in Brittany is still decidedly below the average of the rest of France. Of the old costume, of which splendid specimens may be seen in the Museum at Quimper, little remains in ordinary use, as far as male attire is concerned, except at some out-of-the-way places like Pont l'Abbé; but the female head-dress, though not so picturesque as the high caps worn on high days and holidays in Normandy, has a stranger effect from its close similarity to conventional forms, and as female servants supply the place of the *garçon* at almost all Breton table-d'hôtes, it is difficult at first to avoid the impression that lay sisters are waiting upon you—and generally, it must be confessed, waiting very clumsily. Indeed there is a marked superiority of the man over the woman, both in appearance and intelligence, observable, as a rule, throughout the country.

But most travellers in Brittany at the present day will find their chief interest in the scenery and the architectural monuments, whether Christian or "Druidical," as they are sometimes vaguely termed, though this use of the phrase Druidical is at best but a veil to disguise our ignorance. The scenery of Brittany generally, and notably of certain districts—such as the neighbourhood of Quimperlé and Lannion, and the region lying between Huelgoet and Carhaix—differs conspicuously, and most favourably, from the dull uninteresting dead level characteristic of northern France elsewhere. Both in detail and general effect the moors and river banks and wooded slopes, with their granite rocks and rich growth of ferns of every kind, will recall to those familiar with it the lovely scenery of South Devon. The pedestrian may roam for miles and miles along the steep, rocky banks of the Isère and Elzé, or track the sparkling, dashing Guier up from Lannion to the ruined castle of Tonguëdec, or explore the wooded heights and moors that stretch far away from Huelgoet—where the site of a mountain chalet of Anne of Brittany, secluded from all sounds but that of the rushing sea—is still shown—and may well fancy himself on Dartmoor of the banks of the Erme or the Yealm, or—but for the few lakes—in parts of Westmoreland or Cumberland. And the lanes, with their high banks and hedges—so utterly used normal type of French roadways and the roughly cold, stone walls which often fence them in or divide field from field with their irregular steps, in place of stiles—small course characteristic Devonian peculiarity. No picturesque parts that the whole of Brittany is likelier of the rather over-of Devonshire. This cannot try of the Rance are very praised scenery of Dinan; th at Richmond or even at pretty, and may recall the T than pretty. Nor can any-Pangbourne, but they are never road from Auray to the thing be drearier than the straight, inviting shrine of St. Anne, or the longer course from Auray to Carnac—those who are wise will take a boat to Locmariaker—or from Quimper by Pont l'Abbé to Penmarch—a somewhat over-rated point of view, by no means to be compared with the rocky promontory of Point de Itaz. But still there is a great deal of this charming scenery, with its mountain streams, and granite rocks, and moorland, throughout Western Brittany, though it will mostly be missed by those who keep to high roads and railways. The abundance of granite, to which reference has been already made, helps of course to account for the "menhirs" and "dolmens" about which so much has been written, and so little is certainly

known, but on which we need not dwell at length here, as we so lately had occasion to review a work bearing on the subject. Suffice it to say that there can no longer be any doubt, after recent exhumations, of the sepulchral nature of the dolmens, consisting of two or more upright stones with another or several others laid over them, while it is more than probable that every dolmen was originally covered by a tumulus, though in many cases the superincumbent earth has wholly or partially fallen away or been removed in the lapse of ages. The most perfect example of this kind of construction is that on the little island of Gâvr Innis, with its elaborate wall sculptures, partly in spiral lines, supposed by some—wrongly, we conceive—to denote serpent worship, while next to it comes the "Butte de Oésar" on the mainland, of about equal dimensions but of less curious workmanship. Of the proper destination of the menhirs, whether for religious or civil or sepulchral purposes, it is less easy to speak with confidence, no bodies having been as yet discovered buried under them. But it is a mistake to suppose, as might be gathered from the ordinary guide-books, that a continuous street, so to term it, of these monumental stones stretches for miles from Kerlesant to Mœnac. They are found in groups at various intervals between these extreme points, but there is nothing to show that any continuous line ever existed, and solitary menhirs, or two or three together, are frequently found elsewhere, while many more have fallen or been broken up for farm-buildings and the like. That similar monuments are occasionally to be seen in Cornwall and Wales is not wonderful—whatever explanation of their design be accepted—when we recollect, what the very names of Wales and Cornwall indicate, that the same Celtic race who peopled Brittany passed over to the western shores of this island, where they left indelible traces both on the soil and in the blood and language of the native inhabitants.

We have left ourselves little room to speak of the church architecture of Brittany, on which alone a volume might be written. It has been justly observed that the older parish churches have a peculiar character of hardness, dreariness, and almost grotesque sternness about them. This arises partly from the granite without and whitewash within, while the heavy appearance is greatly increased, both within and without, sometimes by the church ending in a cross transept at the east end without a chancel, and much oftener from the unbroken, steep, the long low roof extending over the side aisles, which gives a sense of the grandeur even of the very without any clerestory, which Pont Croix, and is only partially striking Collegiate Church at the tall and graceful spire of pie—believed, there or elsewhere, by feature of otherwise quite insipid granite which is so common a noble shrine as that of magnificent village churches. Such a fourteenth century—our Lady of Folgoet, erected in the the Cathedrals—must, one of the finest churches in Brittany after of effect as a church be considered exceptional. Its solemnity tracery of porch is not less remarkable than the exquisite the peculiar arches and windows and roof-screen; nor does its magnificent structure of the long southern transept, with wall—looking porch and the three altars against its eastern the—like a subsidiary aisle, turned at right angles to nes body of the church—convey any impression of ungracefulness, while the lofty spires, over 150 feet high, flanking the the torn porch, add much to the lightness as well as the dignity of of general appearance. If the Breton Cathedrals retain something the eastern simplicity, they have more than all the grandeur of the best specimens of parish churches. None of them can boast Charvialh of ancient stained glass which is the special glory of Le Mes, or the marvellous and unique grace of the eastern end of aid name, with its double cincture of choir aisles and cordon of pie chapels beyond them, and forest-work of flying buttresses and tinnacles, as it is visible, unlike too many French cathedrals, from the broad open space around it. But Quimper, which is the West, and St. Pol de Léon, one of the oldest, of the Cathedrals in Brittany, which bears a strong family likeness to Quimper, on a smaller scale, have also their double row of choir aisles, and Quimper is rich—though not so rich as Chartres—in old painted glass, while the lofty roof, rising to a height of 120 feet, and the two western spires of 250 feet high, add greatly to its external grandeur. The cathedral towers of Léon are somewhat dwarfed by the nearly 400 feet high, overshadowing a church not large or otherwise remarkable, except for the perceptible inclination of the nave—not the choir—in a southerly direction, a specialty observable in the choirs of some other Breton churches. Quimper is still an episcopal see, but Léon, like Dol, Tréguier, and some other Breton Cathedrals, each with a character and history, and a special beauty of its own, is no longer the seat of a bishop; there may be seen indeed in the north choir aisle the kneeling effigy of St. John Francis de la Maroche, the last of his line, with a long Latin inscription telling how he was the administrator of the supplies granted by the English Government to the *émigré* clergy, and died in 1806. There is something in this constant recurrence of melancholy scenes which seems to deepen the resigned, old and which certainly attributed by Souvestre to Breton religion, writer calls "the deathlike" at Léon with what an English Indeed, as we pass from the stillness of the scarcely living city, its crumbling castle, its quaint old town of Brittany, each with silent streets, *Troja fuit* seems to van churches, and its narrow seem to be wandering amid the debris of the past. The strength of two successive forms of art—the once full of creative power—the pagan and the

traced in imperishable characters on the stones of Carnac and on the granite shrines of Folgoët and St. Barbe, and in those mute memorials is contained the history of Brittany. It will no doubt gradually become assimilated to the life of modern France, as the old nomenclature is already succumbing to the new departmental divisions of Finistère, or Morbihan, or Côtes du Nord; but the more completely it succeeds in identifying itself with the "ideas of '89," and wipes away the Parisian reproach of "*le pays le plus arriéré de la France*," the more entirely will it lose all identity with its own past. The "revolutionary torrent" of advancing intellect, to cite an ugly jest of Courrier's, may prove far more effective than the deadly waters of the Loire. Morbihan and Finistère may attain to the highest ideal of French civilization, as it is understood by senators and savans of the day, but "poor rough Brittany," which, as Michelet sneeringly complained, "is so Gaulish that it is scarcely Proflch," will have ceased to exist. It is the one district of France that has dared to be more than a century old; and in modern France to break with the national history in an inexorable condition of conformity to the national life.

#### GHOSTS IN THE DAILY TELEGRAPH.

SOME one has said that, if you have a thoroughly dull neighbour at dinner, you can always arouse and interest her by introducing the subject of ghosts. The newspapers have been suffering lately from a terribly dull season, and are at their wit's end for subjects to discuss. The *Daily Telegraph* has had the happy thought of getting up a public discussion about bogies. Every observant person knows how these discussions are started. First you have an able leading article, expressing an intelligent scepticism. Then some one, probably "in the office," writes a long letter, complimenting the able "leader," and "proposing," as Mr. Paley makes Pindar say, "a subject for discussion." When the subject is ghosts, the public rushes eagerly in, with stories about visions beheld, and mysterious noises heard, by its sisters, and its cousins, and its aunts. The *esprit fort* of the middle classes is allowed to have his say, and demonstrates that ghosts are contrary to common sense, and to the accepted principles of the "latter end of the nineteenth century."

The *Telegraph* and its correspondents have gone regularly through this programme, without actually raising the veil which "severs ghosts from shadow-casting men," and without even adding much that is new to the common stock of ghost stories. The death of Lord Airlie furnished a leader-writer in the *Telegraph* with a peg to hang his article upon. Most people have heard of the "Airlie Drummer," who plays his mystic drum-taps when any member of the house is about to die. The drummer is as well known as the "Drummer of Tedworth" was in the seventeenth century. Old families plume themselves on these airy retainers. A Scotch house believes that it possesses a field in which there is a hidden treasure. When any one approaches for the purpose of digging up the gold, a frightful storm of thunder and lightning punishes his temerity. "And do you really believe that the whole atmospheric system of the planet is revolutionized for the sake of the Macbuddies of Tulloch-buddie?" a sceptical lady asked a member of that ancient sept. But the faith of the Macbuddies is proof against such impious rationalism, and so is that of persons happy enough to possess a family banshee or ominous animal. We are acquainted with a Scotch family in which a black cat always appears "where nae cat should be," and that in the presence of three or four witnesses, before a death in the family. The last apparition "came off" about three years ago, when three ladies of the family saw the mysterious animal, which disappeared as strangely as it had come. Within a month a sister of these ladies died, and they discovered, from an entry in her diary, that she had seen the ominous cat on the same night on which it had appeared to them. Many such anecdotes will be given to the world when some imitator of Sir Bernard Burke publishes "*The History of the Scottish Middle Classes*."

But these agreeable reminiscences have led us away from the *Telegraph* and the Airlie Drummer. Philosophers can readily account for the apparition of warning creatures peculiar to certain families. This is the last service of the Totem, the protecting and friendly animal attached to savage households in America, Africa, Northern India, and Australia. It is less easy to explain the Drummer, and, indeed, the evidence about his performances is not consistent. The *Telegraph* started the subject by averring that on August 19, 1849, a young Englishman heard music like that of "a brass band" as he was making his way to a shooting lodge of Lord Airlie's. The strains of the brass band were, as usual, ominous of disaster. Indeed, even in the suburbs, brass bands are little better than nuisances. The publication of this legend "drew" Mr. N. Macleod, who wrote to the *Telegraph* laconically thus:—"The warning which is heard at Cortachy when any misfortune is about to befall the family is a single drummer, not a band of music." And this, as some one says in *Silas Marster*, "seems a deal likelier"—for brass bands are comparatively modern, and the ghost is an old ghost, not at all likely to be equal to playing the "Wacht am Rhein." But here again the evidence is conflicting, for another correspondent brings evidence to show that a lady "connected with one of the oldest titled families in Scotland" heard a "band of music" early in the spring of 1845, that a gentleman explained the noise to have been caused "by the

drummer-boy," and that a death did happen in the family in about three months. A correspondent of the *Birmingham Daily Post* vouches for it that a certain Miss S. heard "heavenly music" when Lord Airlie was suffering from gout. Mrs. Ann Day, who was at Cortachy Castle in the capacity of lady's-maid in 1845, heard a carriage drive up to the door, when, in point of fact, no carriage was there, and was also startled by the sound of a fife and the beating of a drum. "About this there was something indescribably disagreeable; it seemed as if the drummer were making his way through the floor." In this case, then, the music was far from "heavenly." Thus we are, it will be admitted, confronted with a certain discrepancy of evidence. The music is sometimes heavenly, sometimes disagreeable; occasionally it appears to resemble the strains of a brass band on a lonely heath, and again it impresses the listeners as if it were caused by a drummer-boy contending, not only with the difficulties of his art, but with the arduous task of working his way up through the floor. The only practical question raised is this—Would it be fair for a person who has had a "warning," whether conveyed by a black cat or a white bird, by a drummer-boy or a brass band, to go and insure his life heavily for the benefit of his family? In an agreeable but, we fear, fictitious narrative, Mr. James Payn has introduced us to an Annuity Company which keeps a second-sighted man on the premises, and regulates its dealings by his visions, which invariably prove correct. If he sees a shroud on the client's breast, most generous arrangements are instantly made. But—no shroud, no annuity.

In addition to the Airlie Drummer, the *Telegraph* was exercised by the ghost of Miss Sarah Duckett, which appeared more than once to a farmer named Roberts at Church Stretton. Church Stretton boasts an abortive mine, now filled up, and called the Copper Hole. As the ghost of Miss Duckett appeared to Farmer Roberts in the vicinity of the Copper Hole, the neighbours drew the conclusion that her bones reposed at the bottom of that gulf. They therefore cheerfully subscribed money and hired labourers to excavate the hole. Nothing was found at the bottom but one old shoe. Church Stretton, therefore, now possesses a hole which has been twice dug out to the depth of forty feet, with no other result than the discovery of an ancient piece of shoe-leather. It is doubtful whether a hole with such interesting associations could be found even in the neighbourhood of Gotham.

The philosophic correspondents of the *Telegraph* are not more full of information than the believers. Indeed, of all the letters, we prefer that of "A Sceptic," who knows of a very good sample of a haunted house situated, like most haunted houses, "in the West of England." When The Mulligan was asked for his address, he used to wave his hand so as to indicate a large arc of the horizon, and say, "I live down there." "The West of England" is almost as vague an address; too vague even for a bogie. The people who live, along with the ghosts, in the house "are completely upset and rendered miserable by apparitions and mysterious occurrences which can neither be explained, terminated, nor tolerated. The lady of the house cannot live in it," being exasperated beyond endurance by nocturnal noises, and "the shadowy form of a woman holding a child in her arms." Governesses, too, horrible to relate, have heard doors opening and shutting in the dead of night! This is an extent of ghostly experience with which we ourselves are not unfamiliar. The children (when bored with the nursery) come down stairs and say that "The lady is there again." An accomplished London detective has failed to find even a clue to the cause of the nuisance. We can only say, if the ghost is a ghost—"bolt it with a bishop." This plan, that of exorcism, had lately the most satisfactory results in a house (also in the West of England) which was haunted by the ghost of a woman in purple velvet. The sceptic who tells this story rejects the customary explanation—"rats." Indeed the most imaginative could with difficulty convert a rat into the shadowy figure of a woman with a child in her arms.

As a pendant to the ghost in the West of England, we purpose to describe one which, to our knowledge, appeared lately in a small village near Chipping Norton. This ghost has always appeared to us one of the most "creepy" and disagreeable, while wholly unaccounted for, and uncalled for, of modern apparitions. The village of which we speak consists of one long line of comfortable old houses. The Manor House is but a very short distance from the village street. The wife of the squire happened to be driving through the village, one bright August afternoon, when four children rushed, in unconcealed alarm, out of the open door of a cottage. So terrified was one of the children that she (or he) had a fit on the spot. The lady stopped her carriage and asked the children what was the matter. They explained that they had been frightened by seeing a strange woman on the stairs where they had been playing. On being asked to describe the woman, they said that she was dressed in a long strait dress of flannel, fastened at the throat, and that she had a white band fastened under her chin, and another bound round her body. In fact, they described an old-fashioned corpse as it would appear when prepared for the grave, in the days when the law enjoined that the dead should be buried in flannel. There seems something uncomfortable in the apparition of the ancient dead to the eyes of a set of village children on a sunny August afternoon. Perhaps the M. A. of the *Telegraph* who knows so much about the Hindoos will explain that this "so-called spiritual phenomenon" took place in the Akâsh, or other, by exercise of ascetic powers, or cultivated will, whatever that may mean. The

more uncompromising sceptic will say that the children had been expecting to see a corpse of the old school, and so were the victims of unconscious cerebration. Other incredulous persons will remember how the Ettrick Shepherd accounted for the wraith beheld by his grandmother—"aiblins my grandmither was an awfu' leaver."

#### THE REPORT ON LEGAL PROCEDURE.

THE legal profession bids fair to be relieved from the reproach of being behindhand with respect to reform and progress. Much has been done within the last ten years towards accelerating and cheapening legal procedure; and more has been suggested and attempted, but has hitherto failed to take effect by reason of the supineness of the Legislature, as witness the Criminal Code and the multitudinous Bankruptcy Bills. The latest effort in the direction of reform is fortunately one which it is to a great extent within the power of the judges to carry out without recourse to Parliament, and we may therefore reasonably hope to reap its benefits at an early date. The report of the Committee on Legal Procedure, appointed last January by the Lord Chancellor, has now been published; and, if approved by the judges empowered to make new rules of court and embodied by them in such rules, will work a very considerable change in the legal system of this country. The great desideratum with regard to law as with regard to other commodities is that it should be good and cheap. The character and attainments of the occupants of the judicial bench afford a sufficient guarantee for its goodness, so far as the administration is concerned; but, despite many improvements in our procedure, the expense and delay involved in legal proceedings amount in many cases to a practical denial of justice. This expense and delay have long been mainly attributed to two causes, the cumbrous and dilatory nature of the proceedings, obligatory and optional, between the parties prior to the trial of the action, and the number of appeals of one kind and another open to a defeated suitor without reference to the importance of the matter at stake. This view is practically confirmed by the report of the Committee.

Their first suggestion deals with an important item of preliminary delay and expense, namely, the pleadings in a cause, not the oral pleadings, commonly so called, by counsel in court, but the written or printed statements of their case delivered by each party. These, though deprived of much of their original technicality by the Judicature Acts and rules, still occasionally attain inordinate dimensions, and serve to conceal the point at issue rather than to elucidate the point at issue or give it due prominence. Special pleading as a science is practically defunct, and the very large powers which judges possess of amending the present pleadings at any stage of the cause, up to and including the trial itself, have rendered them of secondary importance. If pleadings do not contain all that they should, the judge may, and indeed is bound to, supply the deficiency, and occasionally does so to the extent of allowing one party to set up an entirely new case. Yet the construction of even the modern modified pleadings necessitates the employment of counsel once at least by each side, and the rules of procedure allow a considerable period for their preparation and delivery, during which little or nothing else can be done. The Committee had been invited to consider the possibility of abolishing pleadings altogether in the Queen's Bench Division, substituting a somewhat fuller endorsement on the writ than that at present in use, to which the defendant should, on appearance, deliver a similarly concise answer. The Committee, however, finding, from statistics compiled by them, that 61·12 per cent. of the total actions commenced in 1879 were settled on the basis of the writ alone, consider that it would be unadvisable to increase the cost of a process which has proved so efficacious in its native simplicity. Retaining the writ, therefore, in its existing form, they suggest that the defendant shall within a specified time give notice of any special defence he proposes to set up which, without such notice, might take the other party by surprise, to which the plaintiff may in his turn give notice of any similar matter on which he intends to rely; silence all the while implying, not consent, but a general denial of the statements and rights of the other party, putting him to proof of all which it lies upon him to prove. Pleadings, without being abolished, are only to be allowed by order of a judge. The plan seems plausible and straightforward enough, and the model on which it is obviously formed—namely, the procedure in County Courts—has been found to work well. The instances adduced by the Committee of the very large class of mercantile and other cases in which the issue is from the outset perfectly plain, certainly go far to show the general utility of pleadings, and of course no judge would refuse leave to deliver pleadings where the nature of the case made it impossible to bring the necessary allegations within the limits of an endorsement.

One point in favour of the retention of pleadings, at least in certain cases, has been overlooked or, rather, misinterpreted by the Committee. Referring to 35·10 per cent. of the actions in 1879, which they return as "unaccounted for, and therefore presumably settled or abandoned after some litigation," they thence infer that in those cases "pleadings were of little use." We cannot acquiesce in this deduction. It frequently happens that the detailed statement of the case by either side brings out with crushing clearness the unsuspected strength of an opponent's position, and so leads to

submission or compromise. It may be said that many of the statements in pleadings are purely formal, and not founded on fact; but when such statements are made, the author of them may be put on oath as to their truth, and his antagonist may take it that what he swears in answer to interrogatories he will stick to in the witness-box. Still the class of cases in which this would be likely to occur would be the class of cases in which the present pleadings would still be available. It is, perhaps, with reference to this question of pleading that one feels most the disadvantage of the Committee's having been restricted in their investigations to the procedure in the Common Law Division. The Chancery Bar is by far the greatest transgressor in prolixity, diffuseness, and irrelevancy in pleading, and it would be straining out a gnat and swallowing a camel were any rule made minimizing Common Law pleadings and letting Chancery pleadings go scathless. Indeed, the Committee go out of their way to imply as much in their Report.

The next abuse attacked by the Committee is one to which the Common Law Division is, on the other hand, perhaps more liable than the Chancery, and which certainly requires redress. The sort of skirmishing at Judges' Chambers which precedes the general action in court is one of the most fertile sources of legal expense, and the facilities for this species of warfare afforded by the existing system frequently enable one party to drive his antagonist out of the field by the brute force of a longer purse. A multitude of summonses may be taken out which, without being definitely groundless or vexatious, are practically tentative and usually futile, and which pile up costs and terrorize the opposite party. The Committee propose to substitute a sort of omnibus summons, on the hearing of which the Master may give directions as to any interlocutory proceedings to be hereafter resorted to in the suit, and also as to the mode of trial. In order to save time and secure uniformity of decision, the Committee further suggest that every case should be assigned from the beginning to some particular Master's list, thus obviating the necessity of recapitulating its facts on every application. All this is very good and tends directly to economy of time and money. The only objection we can see is the difficulty of foreseeing and including in the omnibus summons, as we have termed it, all the requirements which may arise in the progress of the case. At the time discovery is applied for it may be impossible to fix the place where the trial can most conveniently be had, and a subsequent summons might have to be applied for for the latter purpose, at the risk as to costs of the party applying. Still, the Committee would provide that the Master or judge might exercise a discretion as to costs in the case of such subsequent applications, and, on good cause being shown, no doubt injustice might be avoided.

Not only is the number of summonses which either party may take out under the present system a source of oppression, but, as we have before now pointed out, the evil is intensified by the inordinate series of appeals which are open to a party defeated on such summons—a series of appeals usually quite incommensurate with the importance of the point in question. This the Committee fully recognize, and obviate by providing that there shall be no appeal from a judge at Chambers except in cases of special difficulty and importance, and then only when allowed by the judge himself or by special leave of the Court in banc to which such appeal lies when allowed, limiting such restriction of course to cases of procedure and practice. Akin to the oppression wrought by innumerable summonses at Chambers and persistent appeal therefrom is the abuse of the technical processes known as discovery and interrogatories, by which, as the Committee point out, a man may, on his own mere allegation that he has been wronged by another, put that other to unlimited trouble, annoyance, and expense by compelling him to disclose and produce all documents relating, however remotely, to the matters complained of, and to answer on oath an interminable list of questions administered for his examination. It is true that under the existing system theoretical checks are placed on the unconscientious exercise of powers which are unquestionably necessary and beneficial when properly and fairly utilized; but it has hitherto been incumbent on the party called upon to give discovery of and produce documents, or to answer interrogatories, to show that he ought to be relieved from the burden sought to be imposed upon him, the other party being *prima facie* presumed to be acting within his rights. The Committee would revert to what virtually was the practice prior to the Judicature Acts, and would require the sanction of a Master before such inquisitorial powers are resorted to, imposing, moreover, the costs of such proceedings in the first instance upon the party availing himself of them.

With regard to mode of trial, the recommendations of the Committee foreshadow a startling innovation—nothing less, in fact, than the practical supersession of the British jury. In the ordinary course of affairs the trial will be before a judge alone; either party may, however, apply for a jury, which application may be granted if the questions involved are shown to be such as to render such a tribunal convenient, and in certain cases involving personal character the right of either party to have a jury is to be indisputable. The functions of referees, official and special, are preserved, and those of the former are to be extended so as to enable them to deal more thoroughly with the class of cases usually submitted to them. The provisions with regard to juries we cannot but regard as most salutary. A jury, whether common or special, is at best an unsatisfactory and decaying institution. It possesses no special training, has no interest in deciding the matter rightly, is apt to be wearied by detail and led away by the

eloquence of counsel, while the serving on juries is a perpetual *corvée* on those members of the community who are liable to be summoned. A judge having the decision both of fact and of law in his own hands is manifestly a more competent and expeditious arbitrator, especially as in technical or business matters he may obtain the aid of professional assessors. Another great advantage derivable from the proposed system will be the reduction in the number of those abortive trials which, after all the expense of preparing briefs and so forth, end, as every one has all through seen they must end, in a reference.

Further to discourage trial by jury, the Committee suggest that on every such trial, if the judge certify that he is dissatisfied with the verdict, a new trial shall follow as a matter of course, subject to appeal. This last provision leads up to a very sweeping and salutary reform with relation to motions for new trials and other applications which are now *ex parte* in the first instance, embodied in the 14th and 15th recommendations of the Report. It is an utter absurdity that one party should be allowed, behind the back of the other, to make an application on a statement certainly biased, probably inaccurate, and that then the whole business should be gone through again, in order to afford the opposite party an opportunity of answering, often before judges who have not been present on the previous occasion. All such applications will in future, if the suggestion of the Committee be attended to, be made in the only rational manner—namely, after notice to, and in the hearing of, the other side, who can then and there answer for himself, his presence, moreover, acting as a guard against any flights of fancy on the part of his opponent.

While thus improving the method in which appeals are to be brought before the courts, the Committee seek to reconstitute, on more logical principles, the courts before which such appeals should come. Without disturbing the present arrangement—by which appeals from a judge sitting without a jury go direct to the Court of Appeal, and from jury trials to a Divisional Court—they recommend that, in the latter case, the Divisional Court should consist of three judges, whose decision should be final, except where leave to appeal is given, where there is a difference of opinion, or where the matter at stake exceeds the value of 500*l*. For the hearing of such appeals the strength of the Court of Appeal is to be increased to five members—presumably by borrowing a couple of judges from the Courts below, not by any new appointment of Appellate Judges. This plan would secure a more equal division of work between the Courts *in banco*, which must necessarily be retained for certain specific purposes, and the Court of Appeal; would avoid the incongruity of three judges in one room being overruled by three judges in another; and would lessen the chances of suitors being driven to the last desperate and ruinous resource of an appeal to the House of Lords. Moreover, the Court *in banc* being practically equivalent to a Court of Appeal, we should get rid of the anomaly of an extra Court being interposed between a judge and jury and the Court of Appeal; while the same judge sitting alone, or an Equity judge under any circumstances, is only subject to reversal at the hands of the Court of Appeal itself.

The only other point in the Report to which we propose now to refer is that which suggests a lower scale of costs and the prohibition of a special jury in actions where the claim or sum recovered is less than 200*l*. For our own part we would willingly see the experiment tried of relegating such actions to the County Courts, the reasons usually assigned why these tribunals should have Equity jurisdiction so far in excess of their Common Law powers having never struck us as particularly forcible. We are, however, somewhat inclined to yield to the grounds put forward by the Committee in deprecation of such a course—namely, that the increased number of appeals from the County Courts would neutralise the probable benefits, and that the humbler class of litigants, for whom County Courts were primarily established, would be crowded out in such an event.

If the County Courts are not to be resorted to, something must plainly be done in the superior Court, as it is a scandal to justice to hear that "the costs in the smaller actions in the Queen's Bench are often four times larger than the sums in dispute, or even more than this"; and the adoption of a lower scale seems the only practicable remedy. What is to be dreaded is lest the reduction of fees allowed on taxation should drive the smaller litigants to resort to the lower class of solicitors and counsel, in which case it would be small compensation to the clients "to have their causes decided by the best courts and judges in the land." The restriction of appeals from the final judgment of a judge, and the doing away with special juries in these smaller causes, are, however, provisions which can only work for good.

Such, in its main features, is this important Report. A part from its innate and apparent merits, the position and reputation of the gentlemen who have issued it entitle it to most careful consideration by those to whom it is directly and indirectly addressed. The judges who were not members of the Committee will probably be asked to communicate to the Chancellor their views on the questions involved, and it would be curious and instructive to see the degree of unanimity or dissension thus elicited.

#### THE AUTHOR OF DON QUIXOTE.

AN essayist might find a good subject on which to dilate in the fostering influence of a country's political importance on the study of its literature by foreigners. Not that the observation is particularly new, for in the way of expostulation it has been made often enough, but the connexion has not been sufficiently recognized as a matter of course. The man of letters who is not free from the faith of fellow-craftsmen in the uses of leather is apt to be indignant when his favourite foreign man of genius is not received on his own merits. He is over prone to forget that the most universal genius cannot be wholly independent of his surroundings, and that without some knowledge of these he is but partially intelligible. But, *pace* the believers in the enlightening influences of trade and travel, it is generally by political events that nations become known to one another. Trade teaches nothing but trade, and it is always the few who travel. It is but a few of the few who travel to any purpose, and it is only one traveller or so in alternate generations who can make that purpose of profit to others. When peaceful intercourse has done its utmost, it is by fighting that nations make one another's acquaintance, or by the war of one of them with a third party under circumstances interesting to the other. Out of the jaws of the lion comes the honey. No doubt the cannon of Van Tromp had something to do with attracting Milton's eye to the literature of Holland. Political importance does not necessarily mean political power, and a country may become important by being fought over. It was while Italy was the interesting victim of Austria and France that its literature was a common object of study, and the Peninsular War was probably the efficient cause of Southey's and Lockhart's studies in Spanish literature. It certainly was the cause of the popular interest in them. Even those writers in whom the interest of the world is permanent, and whom we are all supposed to read, must suffer from the insignificance of their country. Messrs. Nimmo and Bain have just brought out a series of Spanish prose works in a way which curiously illustrates the truth of what we have just said. The works which are contained in this publication are not Spanish without exception, for three of the twelve volumes are devoted to *Gil Blas*, which belongs to Spain very much as a certain gentleman who lately chose to appear in the bull-ring did—in dress namely, and in nothing else. But the others are at least Spanish in origin. It is typical that it is not possible to speak of the nationality even of these without qualification; for, with the exception of *Don Quixote* and the *Lazarillo de Tormes*, they are presented here, not as they appear in the original, but as they were recast by Le Sage.

The predominance of the French writer is itself a proof of the little attention now given to Spanish literature for its own sake, but it is almost inevitable. In one case, however, the publishers have gone out of their way to prove how little care and scholarship it is thought necessary to show in editing a Spaniard. The series includes—and what series of Spanish romances could help including?—*Don Quixote*, and the masterpiece of Cervantes is treated as no publisher bringing out a fine edition would venture to treat a French or German writer. When Messrs. Nimmo and Bain resolved to reprint *Gil Blas* they obviously felt that some discrimination must be exercised. A competent editor must be obtained for one thing, and they must entrust the task of writing the introductory essay on Le Sage to a master of French literature. Accordingly, Le Sage's writing and recastings of other men's writing are treated in an essay by Mr. Saintsbury. Very different is the measure meted out to Cervantes. We might add, and to Diego de Mendoza or Mateo Aleman; but, as we do not propose to deal at present with any of these twelve finely got-up volumes, except the *Don Quixote*, we shall at present confine ourselves to Cervantes. It is, perhaps, inevitable that the translation given should be the inaccurate version of Motteux; but it is a grievous blemish to a fine edition like this that the only Life of Cervantes which Messrs. Nimmo and Bain could bring themselves to give should be the short and inaccurate notice by Lockhart. The absurdity is heightened by the fact that we have a Life of Motteux, apparently written for the occasion, by Mr. Henri Van Laun, in which the obscure life and ignoble death of the translator are detailed at rather greater length than the career of Cervantes. We have no wish to speak with disrespect of Lockhart's work. Writing while much that is now known was still undiscovered, and necessarily perhaps guided only by Juan Pellicer and Vicente de los Rios, the mistakes he made were unavoidable. The translator of the Spanish Ballads had at least some original knowledge of the country and the language of the man he was writing about. He did not compile his Life, with no apparent knowledge of Spanish, from a contemporary French writer, like the author of a recent work intended to introduce this foreign classic to English readers. The amount of sagacity and force of thought he brought to the writing of this Life gives it even now a certain independent value. But all this does not excuse Messrs. Nimmo and Bain for not at least attempting to give the purchasers of their twelve handsome volumes the results of recent research. No contemporary student of Spanish literature occupies the critical position of Mr. Saintsbury, but surely somebody might have been found to state known facts in readable English.

This is the less intelligible because there has lately been something like a revival of interest in Cervantes. A new translation of *Don Quixote* has been published, and has been sufficiently criticised. Much, indeed, of the criticism was not of a kind to encourage high estimates of what would have been the value of any

new essay devoted to him. Mr. Duffield, the author of the translation—obviously undertaken as a labour of love—has himself departed as widely as possible from the truth in his estimate of Cervantes. He has, in the face of all the evidence, chosen to represent him as a political and religious reformer; and he has, as we took occasion to point out, fallen into many and serious mistakes in matters of fact. But we doubt whether his severest critics have formed a much more accurate idea of the author of *Don Quixote*. Both have persistently treated him, though from slightly different, and, in spite of great apparent divergencies, not more than slightly different points of view, as if he had stood wholly apart from his time and his people. When Mr. Duffield represents Cervantes as the preacher of a cunningly disguised attack on the Inquisition, he is advancing an opinion which it is scarcely necessary to confute; but the author of an article in *Blackwood*, written for the purpose of exposing Mr. Duffield's many errors, is scarcely nearer the truth when he speaks of Cervantes as "the least fanatical of men, who had a charity large enough to embrace within its loving fold Turk, Moor, Englishman, even Portuguese—God's creatures, of whom none of his contemporaries had a good word to say." What is seemingly equally incredible to them all is that Miguel de Cervantes was a Spanish gentleman of the sixteenth century, with the ideas and beliefs of other Spanish gentlemen, and differing from them only—and the difference is ample—in being a great genius. It is a sign of that little knowledge of Spain of which we have already spoken that this want of scientific method, which would not be allowed in dealing with a great Frenchman or German, still obtains in treating of Cervantes. A great discoverer lately published a work in five volumes to demonstrate the existence of a new nation. It consisted, if we mistake not, of a chosen people walking about unrecognized among men, but to be known to the initiated by a mark like watered yellow silk on the left hip. In the times of critical ignorance before Sainte-Beuve, men of genius were apparently considered to form a people by themselves, somewhat in this way. More scientific ideas have slowly made their way into criticism, but *Don Quixote* and the region round him in literature are as yet unsubdued by them. To this still-enduring state of anarchy is perhaps due the fact that the bad and foolish commentators of Cervantes are treated by every new writer on him with a degree of respect never shown to the writers of folly about other great authors. They are, as if it had become a routine, noticed, confuted, or ridiculed; whereas, if the victim of their folly had been Shakespeare, or Rabelais, they would simply be left alone.

Meanwhile the consecrated commonplaces about the author of *Don Quixote* are repeated without any apparent desire to weigh their value; and these may be said to group themselves under three heads—that he was left in a state of poverty disgraceful to his country; that he abolished books of chivalry; and that he was exceptionally ill-treated by the publication of Avellaneda's false second part of *Don Quixote*. It is impossible to enter on a detailed examination of these questions here, but we may state a few reasons for showing why the popular verdict on every one of them should be reversed. As regards his poverty, we cannot, with a respect for Cervantes as deep as that of any of his admirers, see why he should have been other than poor. He was born the younger son of a gentleman of small estate, like hundreds of others for whom their country has not been held bound to provide. His wound at Lepanto and his captivity in Algiers were misfortunes he shared with many of his countrymen. It was the natural course of things that he should not have been paid for his military services. Madrid, as every reader of the picaresque novels, of books of travel in Spain, and of *Gil Blas* knows, was full of retired officers trying to get their pay—their strict due in arrears—far into the seventeenth century. Cervantes was not even an officer; and Philip II., like our own Elizabeth, habitually left his soldiers to starve when he had got the fighting he needed out of them. Neither can we acknowledge that, as a man of letters, Cervantes was treated with the injustice so often complained of. If Spain were inclined to justify herself for her treatment of her greatest man, we are of opinion that she would have a very good case. Cervantes did not begin serious literary work till he was nearly forty. The first part of *Don Quixote* did not appear till he was fifty-six. It had an immediate success, passing through eight editions in six years. There is evidence that the latter years of Cervantes were passed in easier circumstances. Before the appearance of *Don Quixote*, in 1605, he had produced nothing, except the *Numancia*, of permanent value; and men of genius, like other men, cannot be considered entitled to be paid for their work till it is done. Moreover—as Sainte-Beuve, in that essay on Cervantes which shows how nearly a fine critical faculty will atone for want of knowledge of a language, well says—the author of *Don Quixote* was probably too proud a man to succeed by the smaller arts of life. We have his own confession in the *Vieja al Parnaso*, that he himself "had forged his own fortune," and when we remember that it could scarcely have been made different except by dependence on a patron, those who love his memory will not wish it had been otherwise. The other accepted tradition about him, that he ruined the books of chivalry, is even more baseless. It would be infinitely more accurate to say that, because the books of chivalry were becoming ridiculous, therefore *Don Quixote* was written. Much might be cited in support of this opinion—which, in this crude form, is very far from being ours—but one consideration will, we think, show that the services of Cervantes to literature, in abolishing the tales of knight-errantry, have been wholly misunderstood; that he has been praised for what is not his true glory, and for what he never did.

The true successors and conquerors of the tales of chivalry were the picaresque novels. The first of these, the *Lazarillo*, had appeared more than seventy years before, and the second, *Gusman de Alfarache*, the father of a longer line than that of *Amadis*, in 1599, six years before *Don Quixote*; and with immediate acceptance. The mention of *Gusman de Alfarache* brings us to the third of our ungrounded traditions—the exceptional ill-conduct of the so-called Avellaneda. That this literary scamp, whoever he was, did tag a very vulgar, worthless production, full of malignant personalities, on to the first part of *Don Quixote*, is very true. But a dishonest Valencian had done as much for Mateo Aleman and the first part of his *Gusman de Alfarache*. Others had tried their hand at continuing the *Lazarillo de Tormes* of Diego de Mendoza. This writing of false second parts was a common literary offence of that day. Avellaneda's case has received much more attention from writers about Cervantes than it deserves. There are subjects which are not exhausted by a long series of competent studies; there are others which, after being handled again and again, are still to do. A satisfactory biographical and critical work on Cervantes is, as yet, unhappily among the latter.

#### VOLUNTARY AND SCHOOL BOARD SCHOOLS.

THE review of the year's work which the Chairman of the London School Board gave at the first meeting of the Board after the holidays contained one remarkable passage. "We are not anxious," he said, "but quite the reverse, to have voluntary schools transferred to us." Mr. Buxton's disclaimer would probably be shared by most of his fellow chairmen. The School Boards do not, as a rule, care to have any more responsibility thrown on them. So long as the voluntary schools are disposed to bear their part of the educational burden they will be quite welcome to do so. That the voluntary schools are disposed to do this there can be no question. Canon Gregory has a right to feel proud when he looks at the results of the first ten years of the Elementary Education Act. The clergy of the Church of England can boast that when the trial came upon them they gave themselves up neither to despair nor to presumption. It seemed as though only a miracle could save their schools from extinction; but they went on working and hoping as though the issue depended only on themselves. To make their labour fruitful it was necessary that their subscribers should go on keeping up the Church school as an act of grace when they were obliged to keep up a Board school as an act of necessity. It was hard to believe beforehand that any considerable number of people would do this. Perhaps the laity, speaking generally, did not believe it. They thought that year by year the voluntary schools would decrease in number, in size, in efficiency, until at last the School Board schools would cover the whole educational field. But the clergy were not dismayed even by the discouragement of the laity. They knew that this discouragement, if it continued, would be fatal to their schools; but they determined with themselves that it should not continue. How they managed to get rid of it is even now a mystery; but there is no doubt whatever that they did get rid of it. To all appearance, voluntary schools never stood on a better or a more promising footing than they do now. The Elementary Education Act has been in full work for more than ten years, and School Boards have been formed and have built schools all over the country. But their success has not been won at the cost of the voluntary schools. Here and there, indeed, a voluntary school may have found the rivalry of a School Board school too severe to stand up against, but this has been merely an accident. The School Board school has, in such cases, been better, or better placed; it has enjoyed, in fact, some specific superiority which would equally have given it the victory if it had been another voluntary school. But, taking the country as a whole, voluntary schools may face all the tests which can be applied to them without any uneasiness as to the result. They have been subjected to a trial of extraordinary severity, and in no single respect have they been found wanting. If we are asked to say why things have turned out in this way, it is not at all easy to suggest a satisfactory answer. To some extent, of course, religious enthusiasm has been the cause; but this is certainly not the sole reason. The difference between the religious teaching given at an average Board school and the religious teaching given at an average voluntary school is not great enough to dispose the large indifferentist class to pay twice over in order to keep the voluntary school going. Where the School Board happens to be specially hostile to religion, or where the religious instruction given in the voluntary school is of an unusually decided type, it is intelligible that the supporters of the voluntary school should feel that the object to be gained by keeping the voluntary school going is worth any sacrifice that may be necessary to bring it about. But a very ordinary case is that, though the religious teaching given at the School Board school is somewhat more general and less decided than the religious teaching given at the voluntary school, the difference is rather in degree than in kind, and what the average Englishman regards as of most importance may be taken to be present in both. As an explanation of the readiness which the laity have shown to support voluntary schools, the theory that it springs exclusively from religious enthusiasm is insufficient.

The present prosperity of voluntary schools may in part be regarded as an example of the national love of fighting. If the

ground had been entirely unoccupied, School Board schools might have had everything their own way. The 'division between' religious and secular instruction might then have been dictated by reasons of pure convenience, and there might have been obvious advantages in an arrangement which grouped children together for the purpose of secular instruction, while keeping them separate for the purpose of religious instruction. But the ground had not been unoccupied. It had been held to a large extent by voluntary schools; and when the supporters of these schools found their territory invaded by a rival created by Act of Parliament, they felt a natural disposition to show that they could hold their own against him. It is not unfair to suppose that this feeling had a large part in keeping up, and even increasing, the subscription paid to voluntary schools. No man likes to feel that the work he has been doing for a long time and at a considerable sacrifice to himself is to be taken out of his hands and committed to a public authority. Even if the work in question is to be carried on in precisely the same spirit and by the same methods as before, he will be apt to resent the change. The truth of this was seen a year or two back in the attitude of the county magistracy towards the Prisoners' Bill. Yet here the Visiting Justices had not been spending their own money in carrying out their ideas. They had merely administered a public fund in their character as a public authority, and they had no real cause to resent the transfer of their duties to another public authority. But in the case of voluntary schools the managers had come forward of their own free will to undertake a duty which every public authority had been content to neglect. It was perfectly natural, therefore, that they should see in the creation of a new public authority to do the work that they had been doing both a slight and a challenge. They were not, as in the case of the prison authorities, compelled to hand over their schools to the School Boards; on the contrary, they were expressly invited to do their utmost to rival the School Boards. They would have been less than Englishmen if they had refused such an invitation. They may not have cared greatly for the difference between the two schools; it was enough that the one school had been founded and maintained by themselves, while the other had been founded and was to be maintained in opposition to them. If they had allowed their subscriptions to the voluntary school to go unpaid, they would have held it equivalent to a cowardly surrender of the position they had so long maintained; and on this ground, if on no other, they were determined to show that, though the School Board could compel them to pay the school rate, it could not forbid them to pay the voluntary subscription which was to render the rate unnecessary. To a feeling of this kind the second decade of the Education Act is likely to prove a more serious ordeal than the first. The excitement on both sides will have cooled down; those who are genuinely interested in education will, in consequence of this cooling down, have become the moving spirits of the School Boards; and the fact that the School Board schools were originally set up as rivals to the voluntary schools will have faded from recollection. Keen as the rapture of the strife may be in the first instance, it sometimes grows weaker as the fight goes on, and the more so if it is obvious that the other side is ready and even anxious to come to terms. In the presence of these new influences will voluntary schools continue to hold their own against School Board schools? Ten years ago it seemed unlikely that they would do so; but, as that doubt proved to be without foundation, it is safer and certainly more graceful to assume that what has happened once will happen again, and that Canon Gregory's song of triumph will be sung with as much reason in 1891 as in 1881.

At all events, it is sincerely to be hoped that this will be the case. This implies no view for or against the possibility of combining definite religious instruction with the general acceptance of the School Board system. The reason which, even if it stood alone, would be sufficient to make the prosperity of voluntary schools a matter of just satisfaction, is of a simpler kind. They are, as a matter of fact, more humanizing, both as regards teachers and children, than School Boards are—perhaps than School Boards can be. The interest which the clergy take in the parish school is not limited to the actual school work. They regard the children as something more than so many machines for earning the Parliamentary grant, and the teachers as something more than so many machines for qualifying the children to earn the Parliamentary grant. Here and there no doubt the managers of a School Board school may also be anxious to take this wider view of their functions. In the majority of cases, however, they regard themselves simply as the representatives of the ratepayers—bound indeed to do their best to make the school efficient, but having neither the right nor the wish to know anything either of the children or teachers, except in the hours during which they are within the school precincts and engaged in the school work. Even in the exceptional cases they are hampered by the absence of any relationship or permanent official standing outside the school to which they can appeal with any confidence. They know nothing of the children's parents or homes; they never see the teachers, unless when they are actually engaged in teaching. The clergy and the managers of voluntary schools generally stand in a different position. The parsonage is the place to which the parents naturally go for help and advice in anything that concerns their children, and the place to which the teachers naturally go for help and advice in anything that concerns themselves. In so far as the other managers are really identified with the school they become in these respects a kind of supplementary clergy. Thus an

interest grows up between the managers on the one hand and the children and teachers on the other which is human as well as professional. As such it may be of very great value in bringing classes together. In a School Board school this uniting influence is in a great degree wanting. The efforts that the better managers of School Board schools are constantly making to bridge across the interval which divides them from those with whom they have to do are evidence of this. It is scarcely possible to suggest any really appropriate remedy for this state of things, and so long as none is forthcoming it is permissible to hope that voluntary schools will continue to multiply and prosper.

#### ANGLING LITERATURE.

WITH the first of October begins the winter of the angler's discontent, that is, if he be a trout-fisher. In late rivers salmon may still be taken, and the grayling, that flower-like fish, as St. Ambrose calls him, is in season in early winter. Of coarse fish, from pike downwards, we do not speak, and might say, with Gay—

I never wander where the bordering reeds  
O'erlook the muddy stream, whose tangling weeds  
Perplex the fisher.  
Nor trowle for pikes, discompliers of the lake.

The end of September is late enough, in all conscience, for trout-fishing. A writer in the *Times* of October 13 is wrong in his remark that "in the end of summer and in autumn, when the majority of fishers are forced to take their annual holiday, there is little to be done except after a spate, and then the use of the odious worm must be resorted to as the only profitable lure." This authority can know little of his subject—trouting in Scotland. The fact is that the warm soft days of September breed myriads of beautiful water-flies, and the trout rise eagerly at the fly, in favourable conditions, at certain times of the day. They rather prefer a glimpse of the sun, and their hours for feeding are usually about noon-tide, and about three o'clock in the early afternoon. But, though you may see the Tweed, overfished as it is, or the Nith, all a-boil with the rising of good trout, they "bite short" very often, and do not take the fly with the rush which a sea-trout makes, or which even yellow trout make in spring. Hence many disappointments, and persons of short temper may be heard, if not actually using profane language, certainly "aiming at a sweer," as the Scotch gamekeeper said. With all its disappointments, autumn fly-fishing, especially when the waters are at all coloured, is infinitely preferable to the use of "the odious worm." Even if we agree with Mr. Darwin that the worm is apt to wriggle more than his bodily sufferings justify, he is a dirty and unsportsmanlike lure. But autumn fly-fishing "yet is dear, the fishing of the later year, as not unlike the sport of spring." The March-brown revisits his vernal haunts—the March-brown, or a fly so like him, that trout rise at the artificial imitation. There is a melancholy beauty in the autumn woods, but the yellow leaves, floating down the stream, get caught in one's flies, and give a great deal of trouble. This is one sign that the game is up, and the lank forms and comparatively languid struggles of the larger trout warn the angler to reel up his line for the last time—its music is a sound as "sad and sweet" as any enumerated by Tennyson. One looks upon the happy autumn fields, and is obliged to think of "the days which are no more," the days before there was a Galashiels weaver on every pool and stream by day, and a detachment of poachers netting all up and down the river by night.

The end of all things comes, and when the angler reaches town he probably begins to collect angling literature. For some reason anglers are often bibliophiles, and in the old booksellers' catalogues there are almost as many books named under the head "Angling" as under "Cruikshank" or "America." For the pleasure of Anglo-bibliomaniacs Mr. Osmond Lambert has published a little volume on *Angling Literature* (Sampson Low), from which we may confess that we have stolen our references to Gay and to St. Ambrose. Mr. Lambert's little book is a series of unsystematized notes and quotations, which are interesting to a desultory reader. He does not profess to have drawn up a complete bibliography of works on the gentle craft, but he tells his readers where such bibliographies are to be found. We do not observe that he even mentions Stoddart's various and very interesting volumes, which may be often picked up cheap on London bookstalls. *The Moor and the Loch*, that unfailing source of instruction and amusement, does not appear in his index. Before turning to Mr. Lambert's interesting, though too brief, account of fishing in the ancient world, we must mention that his volume is bound in that stiltish sort of parchment cover with which we are familiar in "The Parchment Library." It seems almost certain that this kind of cover for books, as distinguished from the absolutely limp and thin parchment binding imitated from the French style, is a failure. Mr. Lambert's work already gapes fearfully, with covers all twisted and awry, and presents a gruesome resemblance to the mouth of a pike which has been too long out of water. And to gape in this unseemly sort is only the usual custom of books got up in this kind of parchment cover. Where so much pains has been taken with type and with paper, it is a pity that all should be spoiled by a style of binding which is neither pretty nor permanent. A volume like Mr. Blades's *Enemies of Books*, on the other hand, never gapes, however assiduously it may be handled.

Mr. Lambert has a good deal to say about the antiquities of angling. The sport in Egypt he leaves on one side, with only a passing allusion. The monuments have plenty to tell us about angling in the land of Nile. On a wall at Thebes we see a river-boat, in which one man is hauling at a net, while four others, who seem to be wading, are helping him. The net is full of big fishes, and a kite sits on the mast of the boat, looking out for the entrails of the fish, which the sportsmen throw to her. In Thebes, too, is a design of an Egyptian bottom-fisher. He sits in an uncomfortable dining-room chair, and his rod is about four feet long. A gigantic butterfly (in spite of Dr. Stephani, who can see no butterflies in ancient art) is watching his proceedings. In another picture the angler has dragged out a fish of about four pounds weight, with a line about two feet long. But, if the Egyptian rod and line were short, the landing net was immense. Many of the fish which they caught the Egyptians refused to eat, under the pretence that a portion of the dismembered Osiris had been devoured by fishes. At Oxyrhynchus the people declined to taste the fish of that name, and this prejudice still prevails in Upper Egypt. The upper classes in ancient times preferred the use of the *lester*, or fish-spear, to that of the rod and line. Homer has not very much to say about angling. His heroes never ate fish, except when they were positively compelled by hunger to go angling "with bent hooks." This reminds us that Mr. Lambert might have told us something about hooks, from the flint ones of the Mentone bone-caves, and the mother of pearl articles of the South Seas, to that curious ancient bronze hook, already notable for "the Limerick bond," which is figured in Mr. Evans's book on implements of bronze. In one passage, to return to Homer, the author of the *Odyssey* (xii. 234, 257) makes an obscure allusion to what seems to have been a way of securing the line against the bites of fishes. Mr. Currey translates the passage thus:—"As when upon a point of rock a fisherman with long rod, letting down baits to delude the little fish, casts forth into the deep the horns of the shelterless ox, and then, when he has caught one, throws it struggling ashore." The theory is that a small tube of the horn of the shelterless ox was run upon the line. Clearly to toss a whole horn of a shelterless ox into the water would be to startle fish even as guileless and uneducated as the trout of Canadian or Finnish rivers.

Ausonius, in his *Mosella*, proves himself to have been well acquainted with trout and grayling. In his time the fish could be described as *ignara doli*. Now they are pretty wide-awake. Ausonius thus describes the sensation caused by a fish's first struggle:—

Crispique tremori  
Vibrantis setæ nutans consentit harundo.

"Striking" was not what old Younger says it should be, a mere "feel" at the fish, a movement not nearly strong enough to lift the line out of the water. Ausonius struck with a swish:—

Nec mora: et excussam stridenti verberè prædam  
Dextera in obliquum raptat puer; excipit itum  
Spiritus, ut fractis quondam per inane flagellis  
Aura crepat, motoque adadilat ære ventus.

Ausonius tells us that he has seen trout, even after they were landed, collect their forces, and spring aloft, and fling their curved bodies headlong into the stream below, and regain enjoyment of the waters lost to hope, while after them the fisherman wildly leaps,

et stolido captat prensare natatu.

One has occasionally lost a trout for want of a landing-net when half his body was already lying on the grass at the water's edge. Dean Swift said that a boyish disappointment of this kind soured him for life. But we have never known a regularly-launched fish make off in the manner vividly described by Ausonius.

The earliest classical account of fly-fishing is given in Aelian's book, *De Naturâ Animalium*, which was written in the middle of the third century of our era. As the passage is more often alluded to than quoted in full, we give it as it is rendered by Mr. Lambert:—

I have heard of a Macedonian way of catching fish, and it is this: between Beroea and Thessalonica runs a river called the Astracus, and in it there are fish with spotted (or speckled) skins; what the natives of the country call them you had better ask the Macedonians. These fish feed on a fly which is peculiar to the country, and which hovers over the river. It is not like flies found elsewhere, nor does it resemble a wasp in appearance, nor in shape would one justly describe it as a midge or a bee, yet it has something of each of these. In boldness it is like a fly, in size you might call it a bee, it imitates the colour of the wasp, and it hums like a bee. The natives call it the *Ilippouros*. As these flies seek their food over the river, they do not escape the observation of the fish swimming below. When then a fish observes a fly hovering above, it swims quietly up, fearing to agitate the water, lest it should scare away its prey; then coming up by its shadow, it opens its jaws and gulps down the fly, like a wolf carrying off a sheep from the flock, or an eagle a goose from the farm-yard; having done this, it withdraws under the rippling water. Now though the fishermen know of this, they do not use these flies at all for bait for the fish; for if a man's hand touch them, they lose their colour, their wings decay, and they become unfit for food for the fish. For this reason they have nothing to do with them, hating them for their bad character; but they have planned a snare for the fish, and get the better of them by their fisherman's craft. They fasten rod (crimson-red) wool round a hook and fit on to the wool two feathers which grow under a cock's wattles, and which in colour are like wax. Their rod is six feet long and the line is of the same length. Then they throw their snare, and the fish attracted and maddened by the colour comes up, thinking, from the pretty sight, to get a dainty mouthful; when, however, it opens its jaws, it is caught by the hook and enjoys a bitter repast, a captive.

Whatever the "natural fly" may have been (some travelled anglers might still find it on the water), it is clear that the imitation was a red palmer, with a red body. Aelian must surely have underrated the length of rod and line, unless, indeed, the Macedonians merely "dibbled," as is now, we believe, practised by persons who joy in the capture of chub.

The fly must have been a queer one which was partly like a midge and not dissimilar from a blue-bottle, while closely resembling a bee. There is very good fishing now in Illyrian waters, and it might repay an angler to try a red palmer in Bulgarian streams, and to watch the methods of the natives. These change little in remote districts, and the *hippouros* may still be a favourite fly in the streams of the Rhodope.

#### CRITICS AND TEACHERS OF MUSIC.

THERE seems to exist, even among those who are qualified to speak upon the subject, a more than vague idea as to the duties of a musical critic. In a recent work on *Phases of Musical England* (Remington and Co.), the author, Mr. Crowest, devotes his first chapter to the subject, in which, after delivering a philippic against modern musical criticism, we are told that the musical critic should be a guide "who, having a greater knowledge of, and sympathy with, his subject, and seeing more keenly than the general public the varied picturesqueness, which his superior imaginative faculty readily traces, is well able to bring home to the eyes and senses of those who are content to follow him in his critical peregrinations aspects and views which the transient glance of the unaccustomed eye could scarcely be expected to realize." This theory that the critic should be a public expositor of musical ideas Dr. F. Hueffer, in a lecture which he delivered on the subject, seemed rather to combat; for, as we understood him, it was, he thought, the public who, by their increased interest in matters musical, were to force the critics to provide better criticism, and thereby to encourage musicians to aim at a higher standard of art. Mr. Edmund Gurney, that master of musical mysticism who is tempted at times, as he recently told us in his ponderous volume on the *Power of Sound*, to tear up lamp-posts in the street when he was under the influence of certain musical passages, regards the critic as a simple interpreter, who "may really fulfil the enviable part of making others see and appreciate marvels otherwise quite beyond their ken"; whilst some again, perhaps with reason, look upon musical criticism as a pestilence, and warn people, in the words of Byron, as soon to "Believe a woman, or an epitaph, Or any other thing that's false," as trust a critic; or, with Robert Schumann, contemptuously advise the herd to "pick out the fifths" and leave interpretation alone.

It would seem then, according to these authorities, that the musical critic should be either one of these four things—a teacher, interpreter, or pupil of the public on the one hand, or a curious collector of hidden and consecutive fifths on the other. Of one matter, however, all these authorities are sure, and that is that the musical critic, as he at present exists, is thoroughly incompetent. Mr. Crowest's strictures upon the incompetent teacher are not without reason, and all the more so as from his point of view these "form a large majority of those who write on the subject of music." It is true that many of the criticisms instanced by him are only guilty of the sin of indirectness of speech, and, as he objects, revel in "a studied avoidance of all references which may provoke argument or lead to retort" by "the use of broad general statements which cover everything and yet mean nothing"; but Mr. Crowest has met with criticisms in which "Beethoven's sonata in three sharps" is spoken of as if there were only one of them, and others where "light tenors are described as baritones"; and on one occasion, though it has nothing to do with criticism, he has come across a certain artist "who occupies the highest place in his profession at the present day, who had not only never read *Sartor Resartus*," but was also ignorant of the existence of its author. Indirectness in criticism is blamable perhaps, but if directness were practised in such a manner as Mr. Crowest advocates, we fear that the "retort" it might lead to would be an action for libel, and the incompetent critic may justly plead that he would rather veil his meaning in "broad general statements" than bring himself, even for the sake of the divine art of which he knows nothing, under the tender mercies of a court of justice. The form of criticism which Mr. Crowest describes as the "left-nothing-to-be-desired" style is at any rate harmless, whereas that of the musical Boanerges is open to certain inconveniences which the incompetent one can hardly be blamed for avoiding. Our critic of critics objects rightly to the abuse of technical terms which only puzzle the unenlightened, and serve but poorly to hide the ignorance of the writer, and what he says of the acquirements necessary to a right exercise of the critical function is undoubtedly just; but we think, nevertheless, that the "life or death of Music as an art" is not in the hands of the critics, as he suggests, or at any rate not exclusively in their hands. Let those who have the education of the youth of the country in matters musical—these who by their direct personal influence can mould the taste and appreciations of future generations—we mean the professional teachers of music, of which class Mr. Crowest himself is a member, begin to set their house in order, and they will find that the much-abused musical

critic will, so far as his incompetent pen will allow him, support their endeavours. If teachers of music will persist in training their pupils, as the majority do, to play a class of music which is avowedly written for "the pot," to use a homely phrase (meaningless fantasias so called, or graceless gavottes written by themselves), instead of leading them to interest themselves in the works of the great masters of music, how can they possibly expect the best of musical critics, whose only medium of instruction is printer's ink and paper, to excite any enthusiasm, or even to be fairly understood when he writes? To give an example, which is within the experience of hundreds, if not of thousands, of fathers of families in England. A new teacher of music is introduced to undertake the musical education of, say, the eldest daughter in a well-to-do family. The pupil has to a certain degree mastered the elements, and can play one of the easier of Mozart's sonatas on the pianoforte, which she does before her new instructor. With a somewhat ambiguous motion of head, the teacher expresses himself pleased with the performance so far as it has gone, but (and upon this but very often hangs the future of the art, so far as the pupil is concerned) there are some things which must be corrected immediately, and he would recommend a course tending to give greater execution, &c. &c., and on his next visit he produces a senseless fantasia, pleasing, as he describes it, and full of just those passages calculated to perfect the pupil in the art of pianoforte-playing. This work, if it does not prove to be the composition of the master himself, is at any rate published by a house which will allow a commission on each piece of music allotted by the teacher; and for this reason it is foisted upon the unwilling pupil, who, disgusted by it, ends in course of time by becoming a mere machine as incapable of expressing the thoughts of a composer as a parrot or Messrs. Muskelyne and Cooke's automatic trumpeter. When teachers of music, as we have said, give up the merciless system of education that is generally practised by them, and revert to a more healthy and reasonable method, then the critics may be blamed for not carrying on by their criticisms the education which tends to the purification of modern musical taste in England. We are perfectly willing to admit that there are teachers who scorn to employ this method, and who spend their time, too often vainly, in endeavouring to nourish a taste for that which is pure and good in music; but the example given above is surely not an unfair one.

In having said thus much we are by no means to be understood to defend that class of critics which it has pleased Mr. Crowest to attack, but simply to protest that the future of musical art in England, so far as that future depends upon public taste, is not even mainly in the hands of the critics. There is little doubt that much of the so-called musical criticism of the daily and weekly press is unworthy of its name, and that it is little more than the chronicling of the small beer of the musical world; but it can hardly be said that such judgments will affect the future of the art or that it is worth the ink used in denunciation of it. For instance, those critics who saw anything to praise in the late operatic season have their own reward. If, as we should judge by some of their writings, it was worthy of record at all, they will have plenty to pass their criticisms upon in seasons to come. The duty, as it seems to us, of that class of modern musical critic which Mr. Crowest so vigorously attacks lies more in taking care that the public receives its money's worth, and that the promises of *impresarii* and concert-givers should be fulfilled, than in undertaking public education in matters musical. The truth is that the genuine musical critic has but a small public, to which, as a rule, he faithfully addresses himself; and the smallness of this public arises from the fact that few have been rightly educated on his subject-matter so as to understand what he is talking about. This, as we have shown above, is purely the fault of the professional teacher; and it is he, and not the critics, that should bear the blame. It is all very well to set up the chronicler of musical events as a musical critic, and then demolish him with the heavy artillery of censure; but this seems to us to be a somewhat unfair method of dealing with him. We could multiply indefinitely the instances of so-called musical critics who expose their ignorance in public prints; but that would not show that there are not many really learned men who endeavour to do all they can to encourage the art. Had Mr. Crowest shown that those who are really worthy the name of critic were abusing the power entrusted to them, there would be cause for regret; but he has made the error—a grave one, we think—of mistaking the journalist, whose duty it is to chronicle events, for the musician, who comments upon the works performed. It is unnecessary to point out here who are the true musical critics, as their names will rise spontaneously to the memories of all interested in music. Dr. Hueffer's theory, that the critic should be the pupil of the public, is based on the same error, although he seems to have the law of supply and demand upon his side; for, if the public will demand more intelligent notices, doubtless they will in time get them. If there is a real desire for increased musical literature, we may yet see a newspaper similar to the great German newspapers devoted entirely to music and to that genuine musical criticism which these authorities ever does not exist in England. Mr. Gurney's interpreter has already an existence in the compilers of analytical programmes, which seem so necessary at modern concerts, but he is not, and, from the fact of his being an interpreter, cannot be, a critic; whilst Schumann's collector of *fifths*, it is hardly necessary to point out, would soon die out under the law of the survival of the fittest. The musical

future of England does not so much depend upon the ability of musical critics as upon the exertions of those professors and teachers of music who have such great opportunities of cultivating the taste of the rising generation.

#### THE MODERN ROUGH.

THE rough is one of the latest developments of modern society, and he is asserting himself at the present moment in a very remarkable manner. We do not mean to say that brutality is a recent invention; history bristles with incidents in which ruffianism and disregard for human suffering are the predominating characteristics; but, as history for the most part recounts only the deeds of those of "gentle blood," the acts of violence have generally had the sanction of war or political necessity. In England a certain brutal element has always existed amongst the unlettered rustic and mining population; Hodge is much given to correcting the partner of his joys and sorrows; and the miner is notorious for "heaving half a brick" at a stranger, or backing his dog Rose to fight a Bishop; while "puncing" is a recognized form of popular amusement in Lancashire, boots and clogs being tipped with pointed iron for the express purpose of kicking out the brains of their owners' fellow-citizens. But the rough as we, or rather the police-courts, are familiar with him here is "a rabbit of quite a different species," as the French quaintly say, and deserves especial study. His favourite amusement is to assemble in crowds in places where respectable people do mostly congregate, and there to use unseemly language and assault the passers-by. For the existence of the rough in his earlier stages of development there may be some explanation, though certainly no excuse. Like Talleyrand's beggar, he would probably plead that "one must live"; but we should be inclined to retort, with the celebrated diplomatist, that "we do not see the necessity." He may be only struggling in his way to emancipate himself from the dull monotony of poverty and its surroundings, and his eccentricities may, after all, be nothing more than the effervescence of youthful spirits. He has not football or lawn-tennis for a recreation, like his betters; therefore he contents himself with the hat of the passer-by, deftly knocked off to serve him for a ball. His taste for harmony is gratified by howling the refrain of some ribald music-hall song through the streets on Sunday nights; and his martial ardour is appeased by an attack upon the policeman on the beat, when authority is generally at a disadvantage of twenty or thirty to one. But, although the rough is to be accounted for, he is not to be tolerated, and the problem of abolishing him is one which must before long be seriously considered.

Any assembly of a religious nature appears to have a great attraction for the rough. It is perhaps unwise to attempt to convert a street-corner into a temporary camp-meeting; but such an error in judgment is no excuse for "bonneting" the preacher and kicking those who choose to stop and listen to his exhortations. Such aggressive movements as the Salvation Army no doubt provoke a great deal of antagonism; but, whatever may be thought of the prudence of their promoters, violent assaults upon them are inexcusable, and yet they cannot show their faces or sing their somewhat eccentric hymns in public without the risk of being attacked in the most brutal fashion with sticks and stones and opprobrious language. A recent order issued by the Home Office, however, makes the Salvation Army the offender, as provoking a breach of the peace, and, as we have a deep respect for constituted authority, we will not base our appeal for the repression of the rough upon his offences against these enthusiasts. We do, however, insist that a peaceful religious community worshipping according to their lights in their own licensed chapel ought not to have their gas turned out and their officials severely maltreated, yet this is what has occurred this week. Five Islington rowdies were charged at Clerkenwell police-court with violently assaulting one James Green by striking him on the head with sticks. A carman who was passing along Morton Road on Sunday night saw a gang of youths in and around the lobby at the Congregational Church in that thoroughfare. The gas was put out, and on one of the officials attempting to relight it and repress the disturbance, he was knocked down, beaten with sticks, and rendered insensible. The prisoners had used foul language, and one of them had threatened to knock out the eyes of the prosecutor, who, although he has thus far escaped absolute blindness, was confined to his bed for five days, and is still unable to see with the left eye. It is satisfactory to find that Mr. Hosack showed his disapprobation of the gang's proceedings by committing the members for trial. At Southwark, too, the magistrate seems to think that something ought to be done, for he has sentenced several street brawlers to terms of imprisonment varying from three to four months, with hard labour, for organized violent conduct in the public streets. At Marylebone a month's imprisonment has been thought sufficient for a similar offence.

The Clerkenwell roughs exhibit their keen but rude sense of humour in a very characteristic manner. Only the other day several persons were charged with disorderly conduct in Pentonville Road. The evidence proved that scarcely a week has passed without charges being heard at the Clerkenwell Court of assaults by disorderly gangs of roughs, who are in the habit of parading the streets of Islington on Sundays, amusing themselves by engaging in free fights, and assaulting and annoying unoffending wayfarers. On the present occasion a gang of these roughs were making

their way along the pavement in High Street, Islington, pushing all respectable persons whom they met into the roadway. A constable attempted to disperse them, but they collected in front of the Angel Hotel, formed a ring, and continued to annoy the foot passengers. One passer-by attempted to pass through the circle, but his hat was taken from his head, passed from hand to hand, and finally dropped in the roadway by a young woman, and on his attempting to pick it up he was struck in the face, and otherwise ill-treated, his hat being confiscated as a plaything by the mob. A fine of forty shillings or a month's imprisonment was the punishment inflicted upon these playful young men. Considering their social status, the cost of their amusement is certainly large, but an enthusiast for the sport in a good season need seldom deny himself the pleasure of participating in it.

There is another form of prevalent ruffianism with which it is more difficult to deal. The police reports have recently been full of gross cases of wife-beating, and only the other day a man was charged at the Southwark police-court with beating his spouse within an inch of her life. Crimes of violence, especially when women or children are the victims, always arouse popular indignation, and the comparative leniency of the sentences usually passed on the offenders is rightly regarded with disapprobation by the public. As a matter of fact, however, few forms of outrage are more difficult to deal with than this, for in nine cases out of ten the punishment really falls far more hardly upon the wife and children than upon the wife-beater himself. It is a very common criminal experience to find that a man who is ordinarily a "good provider," as Artemus Ward would call him, and a fairly kind husband, will occasionally give way to drink, and, when in that condition, treat his wife with the greatest cruelty. Now, although drunkenness is no excuse for crime, it is obvious that in such a case a long term of imprisonment will deprive the house of its bread-winner, and entail great hardship and distress upon innocent people. Under such circumstances our magistrates usually exercise a wise discretion, and pass a sentence that is rather admonitory than penal.

In ordinary cases of felony heavy sentences and the certainty of detection do act as efficient deterrents; for the burglar, the thief, or the assassin have not the excuse that their immediate surroundings forced them into the crime. Poverty and squalor do not by any means conduce to dishonesty, but they must and do try the temper to an incalculable extent; and it is to violence of temper that wife-beating is in most cases to be traced. Drink is another very active cause; but here again legal punishment is very insufficient to effect a cure. The habitual drunkard is not often reformed by incarceration in prison; on the contrary, it is only too probable that he will, when the time comes, celebrate his release by getting drunk, and then "wallop his missus" as the cause of his late discomfort. While, therefore, the drunkard wife-beater is recruiting his health under the wholesome restraint of a prison, his wife is probably not only starving, but living in daily dread of the inevitable return of her never-do-well and of a renewal of his ill-treatment. No wonder that poor women should be so eager to screen their husbands who have assaulted them, for the chances are that they will in the long run suffer less by so doing. The utterly incorrigible miscreant who ill-treats his wife habitually, and without any extenuating circumstances, is a different class of offender, and requires different treatment. On him the utmost rigours of the law might justly be brought to bear, and not a word could be said in his favour or in mitigation of his sentence. For any other class of wife-beater imprisonment, however necessary, only makes matters worse. It may be hoped that the numerous movements which are now taking place for the promotion of temperance, for improving workmen's dwellings, and for educating the masses to something like an appreciation of the first principles of economic and sanitary laws, may in time result in the amelioration of the condition of the poor, and so diminish this class of crime, as well as others. When poor people find that life is worth living, and that there are other pleasures besides the excitement of drink within their reach, they will not be slow to avail themselves of them, and we may fairly assume that wives who have learnt such lessons will not neglect their homes nor the husbands beat their wives. For the ordinary street rowdy, however, who makes the pathway unsafe for passers-by, and who assaults quiet and respectable people for the mere "fun of the thing," more drastic measures are required; and, if the law does not permit magistrates to pass adequate sentences in flagrant cases of this kind, it is time that the Legislature interfered to place more power in their hands. Unless something is done, the "rough" will soon dominate all our principal thoroughfares, and honest people will have to confine their peregrinations to the still unconquered districts.

#### THE RISE IN THE BANK RATE.

THE increase in the rates of interest charged for the use of capital in the short-loan market, not of London only, but all over Europe, is the most striking feature of the commercial situation at the present moment. On the Stock Exchange prices fluctuate with every movement in those rates, and though trade proper is not affected so much as the market for securities—partly because trade is now conducted so largely upon a cash basis, and partly because the rate of interest in the country generally is not governed exclusively by the rate charged in Lombard Street—still

even legitimate trade is affected, while speculative trade very largely feels the influence. Since August 18, a period of barely two months, the Bank rate of discount has been raised by three successive steps from 2½ to 5 per cent., a rise of exactly 100 per cent. In Paris, the rate having been raised on August 25 from 3½ to 4 per cent., has remained at the latter level; but in Berlin the rate has been raised to 5½ per cent. for discount, and to 6½ per cent. for loans, while in Amsterdam it was raised last week to 3½ per cent., and this week to 4, and in Brussels it is 4½ per cent. The extraordinary enhancement in the value of money, to use the very inaccurate bankers' phrase which usage has rendered unavoidable, is due mainly to the diminution that has occurred in the cash reserves of the leading banks of Europe. The bullion held by the Bank of England is now only 21,700,000*l.*, against 27,400,000*l.* at this time last year, and 34,100,000*l.* at this time two years ago. There is thus a decrease of 5,700,000*l.* since last year, and a decrease of 12,400,000*l.* since 1879. The gold in the Bank of France, again, is only 24,300,000*l.*, against 27,400,000*l.* at the corresponding date last year; and the cash in the Bank of Germany is now only 25,760,000*l.*, against 26,800,000*l.* at this time last year. Thus the gold in the Bank of France has decreased 3,100,000*l.*, and the cash in the Bank of Germany has diminished 1,000,000*l.* The Bank of Germany does not discriminate between the gold and silver held by it, as does the Bank of France. We are unable, therefore, to say how much of the coin and bullion held by it is in the one metal or the other. But the general impression is that by far the larger portion is in silver. However this may be, we see that the gold reserves of the Banks of England and France have decreased in the last twelve months as much as 8,800,000*l.*, while the cash reserve of the Bank of Germany has decreased over another million. Reckoning the gold alone—and we presume that it is the gold alone which has diminished in the Bank of Germany—there is thus a diminution of very nearly 10 millions sterling in the cash reserves of the three leading banks of Europe, or about 12½ per cent. This great diminution, without any means of rapid replenishment, has compelled the banks to take measures to protect their reserves. And the diminution itself has been brought about by the resumption of specie payments in the raw-material-producing countries.

Quite recently the great majority of commercial countries were under the *régime* of inconvertible paper money; but, one after the other, they have either resumed specie payments or they are preparing to do so. France led the way; then the United States followed three years ago. Now Italy has floated a loan for the purpose of enabling it to do likewise, and the Argentine Confederation is engaged in legislation looking to the same object; while it seems as if Austria-Hungary also would very soon undertake the task. Previously to New Year's Day, 1879, when the United States resumed specie payments, the Government of that country had accumulated a large stock of gold—had, in fact, intercepted and locked up the whole of the produce of the American mines for two or three years. Since then the great prosperity enjoyed by the United States and the exceedingly bad harvests with which Europe has been visited have enabled the American people to go on taking more and more gold. Besides retaining at home the whole of the produce of their own mines they have imported from Europe about 40 millions sterling in gold, the result being, as we have just seen, a great depletion of the leading banks in Europe. The Americans have been enabled to do this primarily by the fact that their harvests have been exceedingly good, while the European harvests have been exceedingly bad; and, consequently, Europe owed to America a large debt, which the latter insisted should be partly paid in gold. But another circumstance contributed to the result. The three great reserves of gold in Europe are held by the Banks of England, France, and Germany. Some years ago the Bank of France held much the largest quantity; but it has gradually been losing its stock, until now it has very little more than the Bank of England. It is to be borne in mind that the Bank of France has a branch in every department of France, and that some of the branches, such as those in great towns like Lyons, Marseilles, Rouen, and Bordeaux, do a very large and important business, and require, therefore, large reserves in coin and bullion; that is to say, the Bank of France requires for its ordinary purposes a larger amount of till-money than does the Bank of England, and consequently is obliged to keep a much larger stock of metal than the latter institution. But, on the other hand, both silver and gold being legal tender in France, the Bank, for its internal purposes, is able to use silver as well as gold. It is only for external payments that gold is absolutely requisite. As we have said, however, the stock of gold in the Bank of France has been allowed to run down, until it now little exceeds the stock held by the Bank of England. Moreover, of the stock held by the Bank of France much the larger part is in light coin—that is to say, is not full legal tender, and therefore is scarcely available for foreign payments. When the great demand for gold arose in the United States, the wise course for the Bank of France would have been to raise its rate of discount, and thus to check the drain to the United States. But it chose to do otherwise, and consequently the drain went on, with the result that we have just been pointing out. The Bank of France is a State bank under Government control; and the Government of the Republic, being anxious to win the support of the capitalist classes by proving to them that trade can be as good and money as cheap under the Republic as under the Empire, insisted that the Bank should not raise its rate of discount. In return it ordered the Receiver-General to collect all the gold they could in getting in the taxes, and

to pay the whole into the Bank of France. Still, as the figures we have quoted show, the drain was so great that the depletion of the cash reserve went on. Thus the ultimate result of the action of the Government was to drain the circulation of gold as well as the reserve of the Bank. At last the Bank has become alarmed. Even now it has not raised its rate of discount above 4 per cent.; that is to say, it keeps the rate fully 1 per cent. lower than the Bank of England. But it refuses to pay gold on application—those who wish to cash notes being obliged to accept silver, or, if they obtain any gold, it is in very light and small pieces. The refusal of the Bank of France to pay gold has thrown the whole drain upon England and Germany. The Bank of Germany has raised its rate to 5½ per cent.; besides, as we have already said, it is generally believed that the Bank holds but very little gold. Consequently the main pressure at present falls upon the Bank of England; and the Bank, to protect itself, has been obliged, in the course of two months, to double the rate it charges to its customers for the accommodation it affords.

The demand for gold is chiefly for the United States, but it is not exclusively so. Italy also, as we have already said, is preparing to resume specie payments. Some months ago it floated a loan for that purpose, the contractors engaging to furnish it with 8 millions sterling in gold. And they have been gradually fulfilling their contract. A part of the sum they obtained from the Bank of England, and a part they have picked up in provincial France, in Germany, in Holland, in Russia, and even in Egypt. Their object has been to spare the London money market as much as possible, and immediately, no doubt, they have spared it. But in the long run it comes very much to the same thing whether the gold is taken directly from London or from the sources from which London supplies itself when needful. The contractors for the Italian loan have been gathering up assiduously all the spare gold that existed anywhere in Europe, and consequently, when the Bank of England raises its rate of discount both in order to prevent the withdrawal of gold and also to attract gold from elsewhere, it is found that the supplies are so scanty that the rise of the rate does not act as effectually as was expected. Another curious result of the action of the Italian loan contractors is that the demand which at this time of the year springs up in various quarters—as, for example, in Egypt—for English gold has been accentuated. For the contractors had already taken away any spare gold that existed in those quarters; and therefore, as soon as the demand arose, it had to address itself to London directly. The Argentine Confederation also has been taking a considerable amount of gold. The Confederation, like most of the raw-material-producing countries, suffered severely in the late depression; but prosperity has now returned, and with prosperity the value of its paper has been rapidly rising, until it is now very nearly up to par; and preparations are being made for the resumption of specie payments. Accordingly, a demand for gold has sprung up; and, though it is neither so large nor so pressing as the demand from the United States or from Italy, it is still, when added to both these drains, sufficient to make itself felt upon the London market. In addition to all these demands, there are temporary and small demands for various quarters, such as Egypt, Vienna, Constantinople, India, and other places. In themselves each of these demands is small, but, when added together and combined with the drain to the United States, Italy, and the River Plate, they aggravate the pressure upon the London market, and compel the enhancement in the value of money which we have seen.

As regards the future, it seems clear that the interest paid for the use of capital in the short-loan market must be higher than it has been of late. The present urgent demands will no doubt soon subside. That for the United States will certainly pass away at the end of the year, if not sooner. The Italian demand, also, is of definite amount, and will in the course of next year be satisfied; while the other demands are in themselves either temporary or unimportant. But nevertheless the value of money must rise higher than it has done for some years back, partly because the cash reserves of all the leading banks are so very low, and partly because trade is improving. It is one of the inevitable consequences of an improvement in trade that both prices and wages rise. It is the great rise both in prices and wages which is the cause of the demand for gold in the United States. When prosperity set in in 1878, after the long depression that followed the New York panic of 1873, the inflation of the currency was necessary to enable the new business to be done. And, to a lesser extent, the same inflation must follow wherever there is increased prosperity. The rise of wages not only implies that the same number of workpeople are paid larger sums, but that additional workpeople are taken on. It implies, in fact, that the whole of the labouring classes are fully employed, and that each employer, in order to attract the best labour to himself, is competing with his neighbours by offering better wages. It implies also that capital is employed to its fullest extent, that every kind of business is being extended, and that enterprise and speculation are active. This being so, it necessarily follows that the demand for money is active, and consequently that the prices to be paid for it must be higher than when that demand is light. It seems probable, therefore, that the period of very cheap money, which has now lasted so long, has drawn to a close, and that for some time to come we may see higher rates steadily ruling.

## THE CESAREWITCH.

**E**VEN if the Cesarewitch had not been run, the handicap would have been interesting as an official statement of the relative merits of many well-known horses, as far as they could be judged on public form at the time the weights were arranged. There are so many races in these days that it is difficult to remember their various conditions; so, before considering the details of the late Cesarewitch, it may be as well to notice the terms under which that race is run. The Cesarewitch is a handicap run during the Second October Meeting at Newmarket, when every racehorse in training has presumably shown his form in public during the season. It is natural to expect the great autumn handicaps to be far more accurate than the City and Suburban, the Great Metropolitan Stakes, and the other spring handicaps; for, generally speaking, many of the starters for the latter races have not run in public since the previous autumn, and great changes often take place in racehorses during their winter's holiday. Some thicken and lay on muscle; others fall away or grow weedy; while others become so gross that it is impossible to get them thoroughly fit until some time after the great spring handicaps are over. In the autumn, however, there is no excuse for horses being insufficiently-trained, and they are then more likely to be overworked and drawn too fine than to be too fleshy and under-trained. It is sometimes the case that a horse is kept more or less in reserve for the autumn handicaps, and either not run at all during the previous part of the season, or merely run when half-prepared. Occasionally horses are absolutely pulled in their earlier races in order to ensure their being lightly weighted for one or other of the October handicaps; but running them half-trained is an expedient more frequently resorted to by those who race for profit rather than for honour. Nevertheless, in by far the greater number of cases, the competitors for the great autumn handicaps have been run with the intention of winning several times during the season. The length of the Cesarewitch course is about two miles and a quarter, and as at least one or two horses are usually started solely to make the running in the earlier parts of the race, the pace is generally very fast, and consequently the Cesarewitch is a severe trial of stamina. A course that is half as long again as that of the Derby is obviously a wearying one, especially when the race is run at a high speed from start to finish. The Ascot Stakes, which is run over a course two miles long, and the Goodwood Stakes, a race two and a half miles in length, are the two long races of most importance next to the Cesarewitch, and they form to a great extent the guides to the handicappers, as well as to the gamblers, who deal with the Cesarewitch. The entrance is 25*l.* each, 15*l.* forfeit, and 3*l.* only for those who do not accept on the publication of the handicap; and, in consequence of these easy terms for non-acceptors, a large number of horses are generally entered. The Jockey Club adds 300*l.*; but, considering what an important race the Cesarewitch is, the stake is not a large one, as it seldom exceeds 1,600*l.*; while the Manchester Cup, which is a handicap with somewhat similar entrance fees, was this year worth 2,500*l.* The great profit often made on a Cesarewitch victory proceeds mainly from betting. The weights apportioned to the horses entered for the Cesarewitch are subject to certain subsequent alterations. If a horse wins the St. Leger, he has to carry at least 8 st. 5 lbs. In the present year, this condition made no difference in Froquois's weight, as he had been handicapped on those very terms. Last year, Robert the Devil had been handicapped at 8 st. 6 lbs., so his weight also remained unaltered by his victory in the St. Leger; but if Ishmael, who started second favourite for the late St. Leger, had won that race, his weight for the Cesarewitch would thereby have been raised almost a stone. A winner of a handicap worth more than 300*l.*, after the date of the publication of the Cesarewitch weights (September 1st), has to carry 10 lbs. extra, and a winner of any handicap of less value, 5 lbs. extra. For winning weight-for-age races after the publication of the weights there are no penalties, with the single exception of the fixed weight for the winner of the St. Leger. Some ten days before the late Cesarewitch two horses won weight-for-age races worth more than double the amount which would have added 10 lbs. to their weights if they had been running for handicaps, and yet their Cesarewitch weights remained unaltered. This condition, though not peculiar to the Cesarewitch, is by no means the universal rule in handicaps. Very often the terms are that the winners of any race after a certain date are to carry "5 lbs. extra; of two races, or one value 500 sovs., 10 lbs. extra." The 200*l.* given to the second and the 100*l.* given to the third horse in the Cesarewitch generally lead to several horses being ridden out to the very last.

Robert the Devil had won the Cesarewitch last year. He was now handicapped at 9 st. 10 lbs.—a weight which exceeded by more than a stone any that had ever been carried to victory in that race before. But last season Robert the Devil had won in a canter by four lengths under the highest weight ever carried by a Cesarewitch winner of any age, so his supporters thought there was good reason for hoping that he might win under a still heavier burden; they therefore backed him heavily until his withdrawal from the race showed them that it is well to be cautious before plunging on a heavily-weighted candidate for the Cesarewitch. At the other end of the handicap, weighted at 6 st. 2 lbs., was an unnamed three-year-old filly by Galopin out of Corrie. This filly had run three times last year without winning, but she had not run in public this season. It was rumoured that she was very

fast; and that she could stay, and private reputations seem to be more esteemed than public performances among gamblers on the Cesarewitch and the Cambridgeshire. At any rate, the Corrie filly became a good favourite, although she afterwards fluctuated in the betting market like the shares of a bubble company in a panic. A few days before the race, she slipped and fell heavily, but without doing herself any apparent damage. Up to the very day of the Cesarewitch she was backed for large sums of money, but three hours before the race, to the chagrin of her supporters, she was scratched. Reveller, who had only run once this season, and then indifferently, was supposed to have been reserved to win the Cesarewitch. He was a five-year-old, weighted at 8 st. 1 lb. Last year he had won the Visitors' Plate at Ascot, the Goodwood Stakes, and the Great Yorkshire Handicap, but he had been beaten five times. Goodwood Stakes' winners are the kind of horses for the Cesarewitch, and Reveller was only to carry 11 lbs. more than the weight he won under at Goodwood nearly fifteen months ago. Retreat was a four-year-old colt by Hermit, handicapped at 7 st. 9 lbs. Last year he had run five times unsuccessfully, but this season he had won the Royal Stakes at Epsom, and at the same meeting, when receiving 12 lbs. from Petronel, he had run within three-quarters of a length of him. In the Cesarewitch he was handicapped 25 lbs. below Petronel. His best performance, however, had been in the Ascot Stakes, for which he had come in first, under 8 st., but he had been disqualified on the ground of his having cannoned and bored against Teviotdale, who came in second.

When Iroquois had won the St. Leger he was at once backed at a short price for the Cesarewitch, but Geologist, who had been second in the St. Leger, soon became an even better favourite, and his name stood for some time at the head of the betting quotations in the newspapers. He was to meet Iroquois at an advantage of 12 lbs. in the Cesarewitch, and it was generally believed that Iroquois had not given him a 12 lbs. beating in the St. Leger. The public backed him for large sums of money, and then he was scratched. In course of time Iroquois also was scratched, but, as Mistake was in the same stable, the betting public thought that the reason of Iroquois's withdrawal must be that his trainer knew Mistake to be the better of the pair at their respective Cesarewitch weights. Mistake was a four-year-old colt weighted at 7 st. 9 lbs. His career this season had not hitherto been very glorious, as he had only won a single race out of seven for which he had started.

During the First October Meeting at Newmarket there was a grand revolution among the favourites for the Cesarewitch. In a Triennial Stakes, Cameliard, after being a strong favourite, was beaten by Fiddler. Now Fiddler was handicapped for the Cesarewitch at the low weight of 6 st. 10 lbs., so he was at once installed as first favourite for that race. His reign, however, was but a short one, for the next day Foxhall, the winner of the Grand Prix de Paris, won the Grand Duke Michael Stakes by four lengths, giving 7 lbs. to each of his opponents, among whom was Ishmael, whose performances we have often described. There was then a general rush to back Foxhall, who was at once enthroned as first favourite, a post which he occupied up to the time of the start. He was handicapped at 7 st. 12 lbs., or 7 lbs. below Iroquois, and it was maintained by his admirers that his running with Ishmael in the Grand Duke Michael Stakes proved him to be as good a horse as Iroquois, if not a better. It was thought by many people that a former Cesarewitch winner had a very fair chance of repeating his victory. This was Chippendale, the winner of 1879, who was to carry 8 st. 12 lbs. At this weight he was handicapped, at weight for age, almost on a par with Foxhall. We have noticed on several occasions the public performances of Petronel. It seemed probable that he was the best horse saddled for the race, but 9 st. 6 lbs. is such a crushing weight in a handicap like the Cesarewitch that his winning appeared almost beyond the bounds of probability. Ambassadors had long been expected to win a good race, and as a four-year-old she was very leniently treated at 6 st. 11 lbs. Another lightly-weighted four-year-old was The Star, who had only won one out of twenty-one races, and when he did win, he had started at 20 to 1.

Nineteen horses went to the starting-post, and they were sent away without any delay worth noticing. There had not been so small a field for the Cesarewitch for thirteen years, but it is better to have a moderate number of starters than that the race should be delayed by an extra horse or two of troublesome dispositions. The pace was what racing-men call "a cracker" from the start, and the time occupied by the race was eighteen seconds less than that of last year. The running during the early part of the race was made by two 40 to 1 outsiders, called Americanus and Sirdar. When they had gone about a mile, Fiddler, the fifth favourite, took up the running, and kept it up to the Bushes and down the hill. In the Dip, Foxhall and Retreat dashed up to Fiddler, while Chippendale raced after them. Fiddler then gave way, and Foxhall took the lead, followed by Retreat. It was now certain that Foxhall had beaten Retreat; but, when Chippendale came up, Foxhall was pressed forward again by his jockey. Chippendale made a gallant effort to run up to the American, but to no purpose, as Foxhall galloped in, a ridiculously easy winner, twelve lengths in advance of him. The rider of Retreat eased his horse when his stable-companion Chippendale had passed him, and allowed Fiddler to be third. There can be no question that Foxhall's easy victory was a very grand performance. Whether it was better than Robert the Devil's victory under a heavier

weight by 8 lbs. is another matter. Foxhall is essentially an American-bred horse, for not only was he foaled in America, but both his sire and his dam and his two grand-dams were, if we mistake not, bred in that country. Of course, like racehorses all over the world, he is descended from English stock, and his grandsire on his father's side was the famous King Tom. If a Foxhall and an Iroquois come over every year, we shall have to begin to think seriously about improving our breed of horses. We may conclude by observing that Foxhall was trained by William Day, whose well-written book on *The Racehorse in Training* we had the pleasure of praising in these columns some time ago.

## REVIEWS.

### THE IMPERIAL GAZETTEER OF INDIA.\*

THE writer of an excellent article on Sir R. Temple's "India" in the July number of the *Quarterly* mentions incidentally that he had just received "the first six volumes of Dr. Hunter's great work, on which he had been engaged for the last six years." Mr. W. W. Hunter, of the Bengal Civil Service, has, we beg leave to remind the editor of the *Quarterly*, done much more than turn out just half a volume a year. The plain fact is that the Director-General of Statistics to the Government of India, for this is his correct official designation, has compiled, between 1869 and 1880, just one hundred volumes relating to the history, revenue, population, agriculture, commerce, and a great deal besides, of twelve provinces and two hundred and ten districts. Of these no less than ninety volumes have been in print and circulation for some time past. The latest production of Mr. Hunter's pen is something rather different. In the earlier work, about one volume on an average was devoted to a couple of districts, and these productions will be of sterling value to those district officials who are constantly changed and who yet are really the very bones and sinews of the Anglo-Indian frame. When a Magistrate or Deputy-Commissioner is suddenly shifted from one station to another, from Chittagong on the shores of the Bay of Bengal, to Bankura in the West; from Gujranwala on the Chenab, to the Derajat across the Indus, he will find in some one volume or other of the statistical work everything that the toil and research of his predecessors have put on record. But it is obvious that the general student, the M.P., or the Governor fresh from England, requires something more portable, compendious, and concise. And this want the nine volumes of the *Gazetteer* are calculated to supply. The earlier volumes, as remarked in the preface, "although by no means too elaborate for administrative requirements, are practically within the reach of but a small official class." The plan of a grand work of this kind is not a new idea. It was one of the *mina ingentes* and the *opera imperfecta* of the old Court of Directors. It formed the subject of correspondence more than a century ago. It is associated with the names of Francis Buchanan and Montgomery Martin. Of isolated attempts to supply information about castes and trades, summary Revenue Settlements and intricate rent-free tenures, rivers and sand banks, ancient monuments and new marts and bazaars, there has been no lack. Some of these have been printed, circulated, and eaten by moths and worms. Others lie buried in manuscript under the masses of correspondence which Leadenhall Street accumulated and made over to the India Office at Westminster. Many were distinguished by fulness of knowledge, scrupulous accuracy of detail, and politic breadth of view. But it was all unconnected and disjointed. Nothing had been done on a comprehensive, uniform, systematic plan; and while in one or two departments much had been recorded twice over, in others a vast fund of information passed away and perished with the recollections and talk of some antiquated Collector or Commissioner, who had been the successful ruler of a province, or, in Oriental phraseology, the father of the people. Moreover, in many instances the labour had been unpaid. It became imperative that the task of devising a correct plan, of disciplining a staff of workers, of procuring a sufficiency of material, and of digesting and arranging it under the most convenient heads, should be entrusted to one single individual. It was still further desirable that he should be a member of the Civil Service, and that he should be possessed of considerable literary ability. Familiarity with Indian phraseology, with the outlines of our legal and financial system, and with the main divisions of the civil and military and subordinate agency, was one essential; and the power of shaping rude masses of information, and of bestowing on them as much literary grace and polish as the subjects admitted, was another.

That these qualifications are admirably united in Mr. Hunter it needs no labour to demonstrate. There is happily in the vast field of Anglo-Indian administration room for the exercise of every exceptional and peculiar gift—enunciation of liberal principles in a comprehensive minute or despatch, proficiency in Oriental classics, skill in reproducing the discoveries of others, tact and judgment in the management of the Englishman and the treatment of the native. The present is an example of the union of official knowledge with descriptive power. A large portion of the nine volumes before us may be found in some

\* *The Imperial Gazetteer of India*. By W. W. Hunter, C.I.E., LL.D., Director-General of Statistics to the Government of India. 9 vols. London: Trübner & Co. 1881.

shape or other in the hundred volumes of the Statistical accounts. But one chief merit of the present work is its reduction in bulk and its alphabetical sequence. It is a Gazetteer from A to Z, telling us much of every native State in India, independent, feudatory, and completely dependent; of every province and of every district in the British territories; of every ancient place of renown or importance; and of every modern city, bazaar, mart, emporium, or village which either its trade, its geographical position, or its population has lifted above the low level of mere local celebrity. Where there were six or seven hundred villages in each police circle, and four or five hundred souls to each square mile, it was absolutely necessary to make some selection. It is quite possible that an inquiring administrator may hunt in vain for a populous town or big straggling village which he once cleared of Dacoits, or where, when in camp, he administered prompt and salutary chastisement to a band of *budmashees* and *Lattins*; but, as a general rule, the selection of places has been judicious. About eight thousand, we are informed in the preface, were thought to merit notice. But it would be erroneous to conclude that the *Gazetteer* only supplies the inquirer with what he wants to know about districts, capitals, head-stations, subdivisions, and market towns. There are correct lists of castes, and a short essay on their peculiarities. Wild tribes—Gonds, Santals, Bhils, and Koles—are all passed in review. There are excellent notices of rivers, mines, and manufactures; to every province or city is prefixed an historical narrative of moderate compass, showing how the Hindu Raja succumbed to the Mussulman King and conqueror, and how again the Nawab or Viceroy claimed independence of his own imperial Agra or Delhi, was the founder of a new dynasty, coined his own money, and beautified his own capital. The faint traces left by Greek civilization in Upper India are commemorated; a Hindu might dwell with satisfaction on the enumeration of spots hallowed by the presence of one hundred thousand pilgrims, from Umballa in the north to Saugor Island or Rameswaram on the shores of the Southern Ocean; the possessions still held by the French and the Portuguese, and the traces left by Dutchmen and Danes, are succinctly placed before us; and, if intending colonists or settlers would do well to pause before they put their trust in reports about seams of coal or auriferous deposits in mountain ranges, the sportsman and naturalist will be at no loss to know where he is to look for bison and sambhur, and in what cultivated districts he must content himself with wild-fowl and snipe in the cold season, or with hares, partridges, and quail, and perhaps a stray bustard or a "ravine deer."

No one knows better than the author that some of his materials must be of a perishable or changeable nature. *Multa pars vitabit Libitina*. The ancient histories, the gradations of caste, the commercial and industrial importance of most marts and cities will remain pretty much as they are for years, though the creation of a new line of railway or a navigable canal may possibly affect the wealth and prosperity of some towns and bazaars now the centres of commercial activity. Cities, it is true, may decline, as Agra has done, or be overrun with jungle like Dacca, while obscure spots may hereafter rise into prominence, like Jannalporo on the East Indian Railway, which is almost a counterpart of Wolverton on the London and North-Western line. Population will of course fluctuate. Where the demands of the Government have not been fixed in perpetuity, the statistics of the revenue will also alter for the better in another generation. Possibly the rainfall may be slightly affected, as it certainly has been for worse where rich landholders in the Western parts of Lower Bengal have cut down large forests of Sal timber without turning the cleared spaces into arable land. Irrigation may improve the condition of the agriculturist and prevent or mitigate famine. With the spread of civilization new wants will be felt; and subdivisions, police-stations, Small-Cause Courts as they are termed in India, besides mission stations, chapels and churches, will be established in places of which Mr. Hunter's coadjutors never dreamt. Of course a new census may materially upset all the calculations derived from the last census of 1870, on which reliance has been placed. But even here past labours will become guides and landmarks. A new Director-General thirty years hence will know exactly where to remodel and re-edit, but we are bound to say that it would be very difficult to improve the design, and dangerous to alter the proportions or to vary the arrangement which the Director-General laid down for the observance of his coadjutors and subordinates. We are sorry to see that Mr. Hunter, possibly as a sort of concession to the Liberal cant and twaddle which passes in these days for enlightenment and philanthropy, has made one very pointless remark. He tells us that he has ever "borne in mind that the work has been paid for by the Indian people, and that it was primarily designed as an aid to the better government of this country." We are quite aware that the salary of Mr. Hunter while engaged on this important business is paid not from the English Treasury, but out of the revenue paid by Ryots and Zemindars, or from the arrack and opium which they consume, or the license-tax which they evade, just as the salary of Lord Ripon or Lord Hartington, or the remuneration of Gomez the copyist in the Home Office at Calcutta, or that of De Mello, Head Clerk to the Commissioner of "the Jungle Mahals," is paid. But we apprehend that each of these necessary and useful personages discharges his proper functions on the principle of trying to do good work for his pay. And we are tempted to ask whether Mr. Hunter's salary could not be charged on the taxation paid solely by the European community to the general Treasury, without

reference to that contributed by the "Indian people." It is a fact that to customs, excise, income-tax or license-tax, as well as to municipal funds, the Anglo-Indian community makes large and punctual contributions. It also would lead us too far away into a financial controversy to speculate, on the other hand, on the very considerable amount of rent-free lands set apart, under endless denominations, for the maintenance of Hindu and Mahomedan "ecclesiastical establishments." And the change from Asiatic tyranny, waste, profusion, caprice, and injustice, to British equity, method, economy, scrupulous regard for the rights of individuals and communities, law and justice, is one which, though hardly to be estimated in gold and silver, may well be "paid for," like Mr. Hunter's own salary, by "the Indian people." It is a more agreeable task to notice the appreciation by Mr. Hunter of the labour of his subordinates both in India and in England. If this work was ever to be done at all, it needed all the devotion of civilians and military men duly selected and adequately paid. And we have no doubt that the whole expenditure is as fully justified by its objects and results as an outlay on a new court house, a model prison, an irrigation canal, or a detailed record of the rights in the soil of half a million of cultivators.

The order followed in the description of any one district is something as follows. First we have its physical and natural features. Perhaps it is a level plain, long converted from grass and jungle into one sheet of varying cultivation; or it is cut up by ravines and diversified by low ranges of hills still clothed with forest and underwood; or it is a vast alluvial formation gradually raised and fertilized by the silt brought down by a score of rivers; or it is an undulating plateau, with a pleasant climate, some fifteen hundred or two thousand feet above sea level. Next we have the history, if the tract has anything that can be so called, and we learn how some Hindu Raja built a fort or founded a bazaar, and how some Mohomedan general captured the stronghold and slew or spared the Raja on payment of tribute. Then come statistics of population, castes, agriculture, the tenures of land, the trades, manufactures, and commerce; the calamities by which the district has been impoverished, whether raids, drought, or inundation; the machinery of administration and the medical and the sanitary aspects. Some cities, owing to their traditions, history, sanctity, and political importance, we look for and are sure to find. When we descend to local marts and rustic villages, we make out that the criterion of insertion is a population of at least one thousand souls. But, as we have said, one merit of the *Gazetteer* is not merely its correct description of big towns and districts, and its enumeration of villages on the banks of rivers on which ply fleets of boats laden with sugar, indigo, or jute. A large space is devoted to Provinces—Bengal, Bombay, and Madras; and one of the volumes is more than half filled with an article on "India." This is exactly a subject to test the judgment and capacity of a compiler. Little places are easily dealt with on one plan. Something ending in *pur*, *abad*, or *nagar* is in such and such latitude; it has a weekly market, a school, a municipality, a big reservoir, and a ruined shrine, and this is all that can be known about it; and so with some thousand others. But in an article on India, from sheer plethora of material, it is difficult to fix where you are to begin, or, having begun, where to stop. Mr. Hunter has endeavoured to tell us something interesting about our grand dependency in 535 pages, making up the larger part of Vol. IV. The history of India, properly so termed, is here judiciously condoned. Mythical Hindus; early Arab conquests; Mohammedan Emperors at Agra and Sultans in the Deccan; the growth of the Mahratta power; the settlers from Europe—Portuguese, Dutch, French, and ourselves; the Company's commercial agents gradually developing into captains of armies and rulers of men—all this is concisely told. Here and there a pithy remark or an apt conclusion is a set-off to a long string of dates and names. But useful information is given about the religions, trades, arts, manufactures, and habits of the people; and a perusal might give those self-sufficient gentlemen who are so ready offhand to "give up India" some little insight into the reasons why, under Providence, we find ourselves there and the pledges we lie under a moral obligation to fulfil. It is the fashion to call ourselves the inheritors of the Mogul supremacy, and to look on the Queen as the representative of Akbar and Shah Jehan. Mr. Hunter says pointedly that we won India or the larger part of it, not from the effete successors of Akbar, but from Hindus. Our most determined enemies were Mahratta confederates. Our ablest opponent was a Mussulman soldier of fortune who had dethroned a Hindu Raja in the far South. One of our most important provinces was wrested in two campaigns from the Sikhs. But we must break off here and reserve for a future occasion a more detailed notice of specific accounts of parts of this magnificent heritage.

#### GALLAND'S JOURNAL AT CONSTANTINOPLE.\*

THESE two beautifully printed volumes are worthy of better contents. Antoine Galland is deservedly famous as the first European translator of the *Arabian Nights*. His version is not a good one, but it has served as the basis of all the common popular editions that have succeeded it; and, as the source of

\* *Journal d'Antoine Galland pendant son séjour à Constantinople (1672-1679)*. Publié et annoté par Charles Schefer, Membre de l'Institut. 2 vols. Paris: Leroux. 1881.

Infinite pleasure to innumerable people of all ages and many nations, it must be reckoned among the good gifts of the world. But the interest of Galland's translation of the *Arabian Nights* arises from its subject and its priority, not from its author or its style. Galland does not seem to have been a particularly interesting personage. He had the merit of rising from obscure parentage to a position in the learned world, and he travelled several times in the Levant, besides living for three years at Constantinople in the French Embassy; but he appears to have been always a plodding student without very remarkable natural gifts, and his writings produce an impression of honest labour rather than of intuitive talent. His Journal, therefore, cannot be prized on account of the light it throws on the life and character of the writer. As a matter of fact it throws scarcely any; but, if it did, it would perhaps reveal little that we should care to see.

It is on external grounds—on the information it gives as to the affairs of the time—that Galland's Journal must be valued. Any account of the Ottoman capital in the seventeenth century would possess a certain interest. There are many matters connected with modern Turkey on which the testimony of an eye-witness two centuries ago might throw a peculiar light, and it is often important to ascertain the antiquity and permanence of a custom or law. It is true that De la Ocroix has illustrated this very period in his *Memoirs*; but there is room for much additional information, and any authentic documents of the time must prove useful to special historians. M. Schefer, the editor of these volumes, attaches some considerable importance to the political aspect of the Journal. Galland was attached to M. de Nointel's embassy at Constantinople at a time when the relations of Louis XIV. with the Porte were dangerously strained; and undoubtedly, in the absence of better evidence, this Journal would possess a high value to the investigator of the history of the foreign policy of France in the seventeenth century. M. de Nointel appears to have been scarcely the man to heal the breach. From his arrival in 1670 to his recall five years later he made himself offensive to the Porte and troublesome to his own Government. His peculiar methods of paying the expenses of his tour in the Levant were the proximate cause of his final catastrophe, and he returned to Paris completely broken down. As Dangeau said of him, "Il avait été ambassadeur à Constantinople. Il y alla ruiné, et en revint encore plus gueux." The history of French negotiations at the Porte under such a man might be somewhat exciting, and another man might have brought out the political situation effectively; but we confess that the details recorded in these volumes appear to us both tame and meagre, and one has a strong impression throughout the reading of them that Galland did not care a rush about the delicate or indelicate negotiations of his Excellency, but preferred sauntering about among the booksellers' shops, in the hope of picking up a fine manuscript or perhaps a medallion, to all the diplomacy in the world.

We were about to say that Galland takes an infinite interest in little things; the amount of snow and ice, and then of rain, which apparently prevailed during his stay at Constantinople, affords him an inexhaustible topic for his diary: the frost, he says, is so severe he can hardly write; the snow is a foot deep; the wind is detestable; or he saw three books for three piastres—one of them was entitled so and so, and his Excellency bought it; he shot an arrow perpendicularly into the air, and, to his surprise, it came down again perpendicularly upon him and ran into him; he picked up a chessboard for so much and made a sketch of it; he translated so many pages of an obscure Turkish book; or he stood awhile obtaining "un divertissement assés agréable" from the rapidity with which the Ottoman gardeners planted unions. But we unexpectedly found our criticism forestalled by M. Galland himself:—

If this Journal [he writes on February 16, 1672] should fall into other hands than mine, and trifling remarks of this kind should be noticed, I am content to inform whosoever it be, with respect to these and any other, that, as I write for nobody's satisfaction but my own, I put down no remark without very good reasons, either for my own instruction, or for other ends which cannot be known to all the world; and if they say that the price of a book, a change of wind, a hot day, a cold day, &c., are not things to put in a Journal, and the practice only serves to swell it with mere nothings—without otherwise justifying my proceeding, I have no objection to saying that I do it because I like to do it—*sum cuique pulchrum*. It is surely the least you can allow a man to satisfy himself and give him leave to use all the freedom he chooses in what he undertakes for his own benefit.

After this trenchant defence it is impossible to contest M. Galland's perfect right to inscribe whatever he pleases in his own diary; but it is also our perfect right to say that he pleases to choose uncommonly dull things to record. Now and then he is on the brink of being amusing. The junior member for Northampton will be glad to learn that the miseries of dwelling in a clock-tower have been experienced by distinguished persons before himself. The Mohammedan equivalent for a clock-tower is of course a minaret, and it seems that the Venetian Envoy was put to considerable personal annoyance by being lodged at the base of a minaret, whence the perhaps melodious, but unquestionably penetrating, voice of the muezzin too often resounded abroad and below. The story of the Jew who said that Turks would not be admitted into paradise, but would have to put up with tents outside and look after the Israelitish horses, and was answered by the Sultan, that as there would be no money in heaven, the Jews might as well prepay the cost of the tents, for which a tax was immediately imposed by his Majesty, is really excellent. And sometimes the

records of book purchases are interesting; one envies the discovery of a beautiful MS. of Catullus, Tibullus, and Propertius, on vellum, of the fifteenth century, with marginal notes, for half a piastre; and it is amusing to study the agonies through which the learned world passed in trying to make out the writing of the *Miraj Nameh* in Uigur character, and the innocence of the budding Orientalist when he writes how he picked up "a big Persian book called the '*Shah Nameh*,' with one hundred and twenty miniatures, for thirty piastres. But what possible interest attaches to the following note:—

Son excellence avoit envoyé remercier le Baile de Venise des complimens qu'il luy avoit envoyés par son premier secrétaire sur la mort de M. son frère, par son premier Drogman, au défaut de son premier secrétaire qui estoit indisposé. Il fit faire la même chose à MM. les Résidens de Gennes et d'Hollande par le second Drogman.—P. 47, vol. ii.

The greater part of these volumes is made up of this sort of information, except where the notes bear the character rather of a meteorological forecast or a catalogue of a book sale; and, to confess the truth, we have seldom plodded through so dreary a work as this Journal of M. Galland's. There is very little to relieve the monotony of the wearisome repetitions of diplomatic civilities and incivilities, except now and then a grand procession, a feast of the Orthodox church, or a journey to Adrianople. Now and again, however, we light upon something more generally interesting than the number of guns in a Genoese salute or the unfriendly relations between the Patriarch and the Archbishop of Naxos. It is pleasant to read of the Sunday amusements of the Embassy—how they used to devote that day to dramatic representations, and played the *Cid*, or *L'Ecole des maris*, or *La femme jure et partie*, and how Galland was got up in a Greek lady's dress to take the part of Elvira in the *Cid*. The Ambassador's brother died, however, and thus put a stop to these frivolities. Another amusement of his Excellency was sending Turkish slaves on board French men-of-war in the livery of the Embassy, and thus procuring their liberty. M. de Nointel also affected a good deal of pomp in his public appearances. He would go to mass preceded by his servants in livery, his state chair borne by porters, and six janissaries, with the usual interpreters and dragomans; riding in the midst himself, with four grooms in Greek dress running by his side; and followed by his almoner, first secretary, household, and merchants, on foot; after which, a groom with a superb led horse, and the French inhabitants in large numbers. In fact, he had been ordered by the King to make an impression upon the Porte by the sumptuousness of his state. But the Turks were too well used to idle pageants to draw any decided inferences as to the power and wealth of France from her ambassador's display. They did these things better themselves. Galland is overwhelmed and dazzled by the magnificence of the Sultan's progress from Adrianople to open the Polish campaign:—

J'avois vu quelque échantillon de la magnificence de l'empire ottoman dans les marches du Grand Seigneur à la mosquée, aux jours du grand et du petit Bayram, à l'audience qui fut donnée à S.M., et dans l'entrée triomphale des galères après la prise de Candie; mais je n'avois rien vu qui approchât de la beauté de l'éclat et de l'apparence surprenante de la sortie hors d'Adrianople que Sa Hautesse fit en ce jour pour se mettre en campagne. Toutes les descriptions d'entrées, de triomphes, de tournois, de carrouzels, de mascarades, et de jeux faites à plaisir, que je me souviens d'avoir lues dans les romans, n'ont rien qui doive les faire entrer en comparaison avec la pompe de celle effective que je considérai exactement avec tous les étrangers chrétiens qui s'y trouverent, lesquels pourroient tous, pour ce que fut dans un état de déintéressement et sans préoccupation, faire témoignage de cette vérité. Si Mademoiselle de Seudéri avoit pu se forger dans l'imagination quelque chose de semblable, et qu'après l'y avoir représenté avec le crayon de son élégante plume, elle luy eût donné place dans quelque endroit de ses ouvrages, tous ceux qui y prennent plaisir à cause du vraisemblable qu'elle a toujours taché d'y observer, n'en feroient plus la même estime après avoir leu ce morceau, qui bien loin de leur paroître vraisemblable à l'ordinaire, leur paroîtroit encore au-dessus des extravagances des paladins et de nos Amadis de Gaule. Cependant, il n'y a rien de si vray que ceste sortie estoit la plus belle chose que j'aye jamais vue en ma vie, et j'ay de la peine à croire que dans aucune cour de l'Europe, si on excepte celle de France, on puisse rien entreprendre de plus beau (i. 122).

The ceremony which so excited Galland's admiration was certainly imposing. Six divisions preceded the Sultan's own escort; first, the Keeper of the Seal and his escort; then the Defterdar, or Minister of Finance; third, Ibrahim Pasha, who had governed Egypt, had been disgraced, and had repurchased his ground at Court; fourth, Mustapha Pasha, the Kaimakam of Adrianople; fifth, a favourite courtier and fellow-huntsman of the Sultan; and, sixth, the Grand Vizir, who was the most splendidly accompanied of all. Each of these divisions was preceded by two or more horsemen bearing white horsetails on the top of poles, relics of the symbolical yaks of the Mongols. Another man carried the long green silk standard, with the Arabic inscription in golden letters, "There is no god but God, and Mohammed is his prophet," and on the top of the pole a silver case, containing a miniature Koran. A company of well-mounted Delis followed the standard, dressed in green or yellow satin and tiger skins, and red or green hats, with broad brims turned up before and behind, decorated with aigrettes, and armed with lances and sabres. Next came a company of "the finest infantry that can be seen," five hundred Albanians, Bosnians, &c., well made, young, and lusty, armed with muskets and swords. After these rode horsemen, variously dressed and caparisoned, and Agas, with their following of youths in coats of mail and helmets, carrying bows and pikes; and then three mounted dervishes, holding sacred banners; whilst the young guard and a band of music brought up the rear. When these six magnificent cortèges had passed by,

the still more gorgeous detachment of the Grand Seigneur himself approached. Here Galland succumbeth to the exigencies of the occasion. The subject is beyond him; it needs an angel's intellect to understand and communicate this wonder. Everything was on a vastly greater scale than in the preceding divisions. After a gorgeous troop of lawyers, and emirs, and grandees, and vizirs, of the highest rank and the most splendid equipments, came the camel covered with gold brocade on which was placed the Koran in its silver casket. Another camel caparisoned in green velvet carried a box with the picture of Mecca in it. Thirty mounted falconers, bird on wrist; seven horsemen, each with "a kind of tiger" on the croup, kept for the chase, and riding tamely, covered up with brocade; fifty greyhounds held in leash by janissaries; five or six huge bloodhounds, a dozen painted and decorated turnspits, twenty-five grooms leading splendidly caparisoned horses; and then the Grand Seigneur himself, riding alone, seated on a leopard-skin, clad in massive steel from head to foot, and blazing with precious stones; his sword, bow, and the ewer and basin for the ablutions of religion, were carried after him; and white eunuchs, white horses, carriages, and big drums, with forty of the flower of the guard, and a thousand spahis, completed this wonderful pageant, the description of which occupies twenty-two pages, and brings the enthusiastic spectator almost into conflict with the Académie for coining words expressive of such novel and unheard-of sights.

It is in descriptions like this that Galland's Journal becomes interesting and valuable. The account of the marriage of a dragoman's daughter and her sumptuous trousseau and splendid wedding presents (ii. 60) is curious, and the notes he made from time to time on the rites and dogmas of the Orthodox Church—a subject he was specially requested to study—possess some importance. He does not, however, seem to care much for the Greeks, whilst he cannot conceal his admiration for the Turks. It must be remembered that the Ottoman race was then comparatively young and vigorous; it was only two centuries since they had entered Europe, and their early strength and freshness were not yet enfeebled by luxury and sensuality. The Turks were still a nation of warriors when Galland saw them march to the attack on Poland. They had just taken Candia, and in ten years they would be before the walls of Vienna, to be beaten back only by the arms of Sobieski. There was something admirable about them then. Yet Galland's Journal contains many notes which reveal the same corrupt system of government that now disgraces the Ottoman Empire. The same deplorable principle of letting out provinces to farm, and the same consequent corruption and extortion, existed then as now. But Galland sees the bright side oftenest. Even when he speaks of the proverbial procrastination of Turkish diplomatists he speaks admiringly. Their method, he says, is very different from ours. With great prudence they avoid meeting negotiators face to face, for fear of being surprised by pressing arguments which they might find embarrassing to answer. The opponent can learn nothing from their gestures or features:—"Ils résistent pour se faire valoir, et ils veulent plutôt estre vaincus par de fréquentes poursuites et par des sollicitations répétées, que persuadés par de bons raisonnemens avant que d'accorder aucune chose." Some people, he adds, ascribe this to stupidity, or want of presence of mind, or self-distrust; but he himself is of opinion that it is pure wisdom. Altogether he finds much that is great in the Turks, and loses no opportunity of praising them. A good deal of his admiration, however, must be attributed to a very superficial knowledge.

M. Schefer has edited the Journal with immense care. Every book that Galland sees or buys has a note of explanation attached to it by the editor, and every person mentioned is duly identified where identification is possible. Even a ship's crew is detailed. All we can regret is that so much pains should have been expended on so insignificant a subject. In nine cases out of ten the books and the persons were not worth identifying. But this remark applies to the whole work. It may be useful to a specialist who is working out the history of the foreign policy of France, but he might perfectly well have consulted it in manuscript. To anybody else the Journal must prove wearisome reading, and after toiling through it one has not even the satisfaction of feeling that he has learned anything particularly worth learning.

#### ART IN METAL.\*

ALTHOUGH the pictures in this magnificent volume are of much greater importance than the letterpress, it cannot be said that M. Ménard has in any respect failed in the historical part of his work. It is probable that no account of art in metal so complete has yet been published. The illustrations are of a character seldom seen in books of this kind, and it will not be praising them too much to say that they are exact as well as artistic. Some of the etchings, in particular, are quite worthy of being framed and hung up as pictures, while to the practical metal-worker they are valuable as accurately representing beautiful objects. Some are, of course, more pictorial than others. Of the two prints of the Colleon monument at Venice, the second is the prettiest in this respect; but M. Gaucherel is excelled by M. Lalauze, who, in his representation of M. Guillaume's busts of the Gracchi, has reached the highest point attained in any of the

etchings. This group—for so it must be called—is the property of the French nation, and is well known to visitors to the Luxembourg. The brothers are represented to the waist, standing side by side, the hand of one resting on the shoulder of the other, while the two right hands meet on an inscribed roll. The bronze is highly polished in places, and the whole work, even as represented in the print, is full of an impressive pathos amounting almost to sublimity—a characteristic which French sculptors are constantly striving after, but can seldom be said to have so nearly reached. Another modern French bronze is represented in the next plate. This is M. Degeorge's bust of Henri Regnault, the ill-fated painter. The etching is by M. Martinez, but its chief merit is of a merely technical kind—the difference between the tint and texture of bronze, black marble, and white marble being admirably rendered; but this is not high art, and there is a certain want, whether due to the sculptor or the engraver we cannot say, in the expression of the face, and in the management of the light. A fine work also is M. Martinez's representation of Cellini's bust of Cosimo I. at Florence. The inlaid eyeballs here give the engraver a better chance of rendering the expression. A woodcut on p. 171 is, however, perhaps the best picture of a bronze in the whole book. It represents Bernini's Neptune, and shows that life is still flickering among French wood-engravers. Can we say as much for England? We have dwelt on these representations of bronzes both on account of the difficulty they present to the artist and because M. Ménard's connoisseurs have so successfully overcome it. There are many other engravings scattered through the book, separately printed or in the text, of which some are poor enough, but the average standard is high.

M. Ménard, in his historical chapters, begins at the beginning. It is in Egypt, he says in his opening sentences, that the most ancient metallic work is to be found—the most ancient, that is, to which an approximate date may be assigned. He describes several figures in bronze which were exhibited at the Trocadero in 1878, and which cannot be much later than the Pyramids. These objects were sent for the Exhibition by the Khedive, and few or none of so early a period are to be seen in European museums. Unfortunately, too, a great many of the bronzes and other curiosities of art brought to Northern Europe by collectors and travellers cannot be dated with any certainty. M. Ménard remarks on the stiffness of Egyptian sculpture in representing the human figure, and its comparative ease in representing animals; but he would have withdrawn this opinion had he been acquainted with the early art, of which nothing is known in England and France, and very little in Germany. Under the Eighteenth Dynasty he finds works in gold and silver which may be classed among the *chefs-d'œuvre* of jewelry. The Louvre possesses some beautiful works in gold of the time of Osorkon, but M. Ménard does not mention the much earlier and more interesting jewels taken from the mummy of Kamus, the son of Rameses II., and conveyed to Paris by M. Mariette. M. Ménard has some interesting notes on the Phœnicians. He asserts that they brought their tin, so necessary to the manufacture of bronze, at first by caravans from the Caucasus, and when Assyria stopped the way they sent their ships to Spain for it, and finally to Britain, "à l'endroit où est aujourd'hui le comté de Cornwall." Some silver cups of Phœnician manufacture are in the Louvre. They were found in Cyprus, and some collars and armlets at Sidon; but such objects are very rare. Of the Hebrew jewellers M. Ménard does not seem to have much opinion, and he expresses a characteristically French scepticism as to the narrative of the Exodus. It is impossible to prove that the Jews ever had a style of their own, and not a single ancient object has ever been found which could with certainty be attributed to them. Passing briefly over the metal-work of Assyria, Chaldea, and Persia, M. Ménard gives us an interesting and well-summarized account of the gold objects found by Dr. Schliemann at Mycenæ. But not one of them would authorize us, he considers, to fancy that the celebrated shield of Achilles was anything but a work of poetical imagination. The bellows of Vulcan, as described by Homer, must have been of very primitive construction, and incapable of giving a continuous blast. He next notices the early existence of the art of casting in bronze, especially at Corinth, but does not cite the existence of any examples older than those found at Herculaneum, and now in the Naples Museum. Of these he treats at considerable length, and illustrates his remarks with many pictures, including one of the famous colossal horse's head and one of the beautiful "Narcissus." Of Etruscan work, too, he has much to say, and there is a fine engraving of the well-known "Orator" in the Florence Museum. The art of Rome is, he observes, merely a continuation or transformation of what had gone before in Greece and Etruria.

The art in metal-work of the middle ages is illustrated by examples of Byzantine jewelry, and by monstrances, reliquaries, and other objects for religious uses. This is, however, the least interesting part of the book. M. Ménard longs to get on to the Renaissance, and is evidently more at home in Italy than in Germany. He falls into the usual French error of considering the jewels of Charlemagne as belonging to France; but he is on safer ground when he comes to speak of enamelling. Of English metal-work in the middle ages he is evidently completely ignorant, and gives us only some notes on Irish reliquaries, and an account, extremely brief, of the rarity of "orfèvrerie religieuse" in England. He has evidently never heard of the Mayer Museum, or of "King Alfred's Jewel," or of the writings of Mr. Cripps. He does us justice some pages further on, when he comes to write of the silver plate of the last century, and presents us with a great many cuts of

\* *Histoire Artistique du Métal.* Par René Ménard. Paris and London: Librairie de l'Art. 1881.

sugar bowls, teapots, and other articles "en argent repoussé, travail Anglais." He also, unfortunately for us, engraves a specimen of the modern racing "cup," which takes away some of the credit we might have gained from the Queen Anne silver. Besides very complete accounts of enamel and of Japanese metal-work, there is a chapter on furniture, and the application to it for decorative purposes of bronze, brass, and *or moulu*. The illustrations of this part of the book are particularly taking. M. Ménard tells us that the celebrated Boulle (*sic*) was one of a family of artists who flourished all through the seventeenth century. The most eminent was André-Charles Boulle, son of John and nephew of Peter Boulle, who were both lodged in the Louvre, and bore the title of "*menuisiers du roy*." André-Charles lived to be ninety, and died in the Louvre in 1732. One of his works is a marriage coffer, ordered by Louis XIV. for his son, the "Grand Dauphin," who took it with him to Meudon, where he died. It went into private hands, and eventually became part of the San Donato collection, lately sold at Florence. Orscent and his son were the successors of the Bouilles, and acquired a great reputation under the Regent. The style which we call "Empire" really came in under Louis XVI., and M. Ménard figures a beautiful table or "console" by Riesener, in black wood with marble top. The legs are surmounted by capitals in gilt metal of the Doric order, and wreathed with exquisite laurel wreaths. The outline of this piece of furniture is as plain and stiff as possible, but the applied metal-work is of the most lavishly decorated kind. The last few pages of the book are devoted to the subject of embroidery in gold and silver. Here the engravings, though executed with the greatest care, fail to give any but a very inadequate idea of the work represented. They consist of five altar-cloths of various periods, one decorated with a Spanish coat of arms.

It will have been seen that there are few departments of art on which M. Ménard has not something to say when writing of "Metal." The fact is that he might have made the whole book out of any one of them; and it is a question how far collections of this kind are useful. In the present case the good taste which has kept out almost everything not in itself beautiful has made this a pretty book, and one to be read and turned over with pleasure. It would be gratifying to the critic to be able to say more in favour of a costly and magnificent work, but we have not found enough of any one subject in it to make it really interesting; and the mere turning over of picture-books, though it gives one the idea of learning, is in reality almost a waste of time. It is difficult or impossible to generalize from pages which begin with the bronze-work of the Pyramid-builders and end with the embroidery of Flemish nuns. True, we rise from a study of M. Ménard with a feeling that good art is wonderfully alike in all styles; that the Etruscan orator has characteristics very much in common with the Italian John Baptist of the middle ages, and the modern French Gracchi. The universal and omnivorous taste of the present day will admit the charms of a mediæval reliquary as readily as those of a Lamerie epergne or a Riesener console. How far the publication of books like this, which we perceive is issued at the cost and charges of a "*Société de propagation des livres d'art*," will really influence the taste of the future it would not be easy to say. The artist must know so much nowadays that it is to be feared that too often any originality he ever had is smothered and overlaid. The mere effort to break loose from the trammels of bygone fashions and styles is greater than most men can make. Even such a genius as Stevens displeases us as often as he pleases when he strives for originality and only attains eccentricity. It is no wonder, then, that the employers of artists prefer mediocrity. The imitator of great and good work succeeds where brilliancy is out of place. The general public will always rank the Albert Memorial above the Wellington Monument; but the dissemination of books like this of M. Ménard will at least furnish the minority with reasons to justify their æsthetic preferences.

#### WITH THE KURRAM FIELD FORCE.\*

THIS volume contains, in addition to much which is not only valuable but worthy of permanent record, an extraordinary amount of extremely uninteresting detail. The explanation of the system on which the author proceeded is thus given:—"The diary form of narrative has been retained, as it enables the orders affecting the force, published from time to time, to be given in their original form. It would have been possible to have placed all the orders in the narrative by describing the results; but, though more continuity in the account would have been gained by so doing, yet it would have been only possible by losing the brevity and clearness with which facts are described in an Order Book." What we get then is a copious "Quartermaster-General's Journal," interspersed with circulars of "Military Controllers" and "Commissaries-General," &c. &c., chapter and verse being given for the minutest incidents. "We are told that the facts recorded 'may prove useful to the future historian,' but readers generally prefer a book in which they can take a present interest. Who was appointed postmaster, in which village, and how long he worked the post; the wanderings of one or two camels out of ten thousand, how much or how little certain doolie-bearers were to eat at dif-

ferent times, how battery-cooks were dressed as the season advanced, at what hour the General rode out on various occasions and the precise minute of his return, and a multitude of like minutiae—what conceivable interest can such have for readers? and how will they benefit the 'future historian'?"

The author is better occupied when he treats of so important a subject as that of the transport question; and he has given us some valuable statistics, a study of which may help the Indian authorities in determining upon the best system to be definitively adopted in connexion with the operations of a field army. The first desideratum undoubtedly is that there should be a system of some kind. The carriage establishment of an army on the march in India is an agglomeration of the most varied *personnel* and *matériel*. It is collected from all quarters, and usually hurriedly. Animals of all sorts are enlisted for work, with little regard to whether it is the kind they are fitted for, and shoals of *acoundrals* are enlisted to look after them; some British officers are selected, with more or less reference to their capacity for the business, to superintend the mixed multitude, and the organization is then supposed to be in smooth working order. Of all animals to take into rough mountain country, with heavy burdens, too, on their backs, camels are the worst. They are sensitive to cold, bad climbers, squat down when they fancy, won't get up again for blows or persuasion, and always die in the middle of a public thoroughfare. They died like flies in this expedition. The Adjutant-General to the Kurram force attributes the excessive mortality to the following causes:—(1) the climate was not suited to them; (2) the grazing was scanty, and not what the camels were accustomed to; (3) camels frequently remained loaded from 5.30 A.M. to 4, 6, and 11 P.M., and had nothing to eat on arrival at camping grounds. The writer adds that not more than half were properly clothed. Under these circumstances, it is small wonder that, at the end of seven months only, no more than 4,344 of these animals, out of a total of 13,840 enlisted from time to time, remained to the good. Mules and ponies were, as a rule, better provided for, and their casualties amounted in the same period to little over one-tenth of their number.

It is of course impossible to separate the question of transport from that of the employment of non-combatant followers in the field. The effective strength of the Kurram force on January 1, 1879, amounted to 1,860 European and 5,392 native combatants, or a total of 7,252 men. To this small body were attached no less than 5,709 followers. Those who have never seen an army on the move in Eastern countries will be puzzled to know what purposes such a host of servants can answer. There are first the public followers, who are employed in hospital establishments, doolie-bearers, camel and mule men attached to regiments, the syces and grass-cutters taken with the artillery and cavalry. Private followers include regimental cooks, barbers, sweepers and blustees, officers' servants, syces, &c. This heavy total of 5,709 followers, it should be added, represented only the number considered "absolutely indispensable." It was "reduced to the lowest possible point." The author is of opinion that it would be undoubtedly feasible for a force to do without followers of any description; but, he adds, that it must be at the expense of reducing the fighting strength, abolishing a good many of the present hospital arrangements and part of the camp equipage, and making each man carry his own kit. "To draw the line between efficiency on the one hand, and the reduction of followers on the other, is a problem yet to be solved, and its solution would be much facilitated by the institution of a permanent transport department."

The writer draws attention to the question of shoeing horses in the field, and shows that the arrangements for peace-time are unsuited to campaign work. In British regiments and batteries iron for shoeing is provided by the farrier-sergeant when the battery or regiment is in cantonments; but if an order to march at short notice arrives, there being no arrangement for the carriage of iron, the greatest inconvenience is apt to arise. As the campaign in the Kurram Valley proceeded, the Ordnance Department made arrangements both for the supply of horse-shoes and iron from England, but when the shoes came out they were too small for any but the small horses of the native cavalry.

We notice that orders were early given that every regiment should start as completely provided as possible with intrenching tools. It would be interesting to know if the admirable opportunities open to the garrisons of nearly every station in India to become practically acquainted with the art of throwing up entrenchments are yet turned to any account. Instinct teaches soldiers who have had little experience of disciplined manoeuvre to utilize ground for cover; but it would seem as though old habits of methodical drill, and skirmishing according to book and not according to *terrain*, had unfitted the British soldier for intelligent appreciation of the, to some extent, novel exigencies of modern war. There is nothing for it in the face of rifles but to seek out, improvise, or regularly construct cover of some kind. We are returning to the bush-fighting of savages on a vast scale. It is instructive to note that the superior leadership and discipline of the Germans availed them but little when pitted against the native tact of the French in village and what we have called bush-fighting. Nothing could have been more satisfactory than the cordial and thorough manner in which several of the Punjab chiefs lent their aid in the prosecution of the campaign. It is curious, as illustrating the extraordinary variety of terms on which we co-exist with the multitude of dependent, semi-dependent, and independent Indian states which go to

\* *With the Kurram Field Force, 1878-9.* By Major J. A. S. Colquhoun, R.A. London: W. H. Allen & Co. 1881.

compose the Empire, to read that each contingent furnished by the above-mentioned chiefs had its own Political officers. The Punjab troops were employed in making roads, garrisoning posts along the line of communications, and escorting convoys.

Though these troops suffered much from the inclemency of the weather, yet their hardships were borne without a murmur. All ranks performed their duties cheerfully, and displayed a soldier-like and most loyal spirit. From the time of the contingent leaving Lahore not a complaint of any kind was brought to the notice of either civil or military authorities against any one individual, either fighting men or camp follower.

Whatever may be advanced as to the impolicy of engaging at all in war with Afghanistan, it is certain we have carried back with us some valuable experience. We have discovered manifold shortcomings in our own military system, and have only been successful after a sad loss of life and a prodigal expenditure of money. But it has also been ascertained that there was growing up beyond the mountains a Power which was diligently bent on assimilating European military inventions, and which, if not distracted by international divisions, would at no distant time become a very thorn in our side. Our own armament was doubtless superior to that of the Afghans in the late conflict, but the latter were very fairly equipped. They had of course rifles and ammunition which we had kindly served out to them, but they used also arms of their own manufacture. It does not seem to be known for certain to what extent they were indebted for their skill in making and handling them to foreign instructors.

The brass ordnance captured were of excellent make and well-finished in every respect. . . . The ammunition for these guns was fairly made. . . . There were some Enfield rifle cartridges of their own make, which were a fair imitation of our own in everything except the powder. . . . The mountain guns, of which eleven were taken, were of the same pattern as the 75 lb. steel 7-pounder in our service, and rifled in the same way. . . . The shells for these guns were very fairly made, and the fuzes were made on our model. . . . The whole of their mountain-battery equipment was founded on our models.

The action of the Peiwar Kotal, a capital description of which is given in this volume, was one of the most creditably gained during the war. The enemy held what General Roberts has termed an "apparently impregnable position." It had been fortified with art. The ascent of the jungle-covered steep was only practicable at certain points, and here stockades one behind another three or four deep had been thrown up, and the paths of approach blocked by abattis. "The Afghans had every advantage in their favour, as the only point—excepting, of course, the leadership and discipline—on our side was nullified by the conditions of the fight. Our long-range artillery could have but little effect on their position, while our rifles in close fighting were but slightly superior to the Enfield rifles opposed to them. . . . They had the knowledge of the ground, in which we were deficient; they had their own discipline, which was good, as they obeyed their leaders; and they had ample provisions and ammunition to continue the fight for many a day." General Roberts was justified in saying "The result is most honourable, and could only have been achieved by troops in a high state of discipline, capable of enduring great hardships, and able to fight as soldiers of the British army always have fought."

In concluding this notice, we must commend some excellent descriptions of country and a few neatly executed landscape sketches with which Major Colquhoun has embellished his volume. It may be remarked, however, that, as regards the illustration on p. 98, of the position taken up by the Afghans holding the Peiwar Kotal, it is impossible when so small a scale is used to give anything like an adequate representation of ground. A less artificial method of exhibiting gradients than that used under authority during the last ten years or so is much required by military draughtsmen, as all who have experience in hill-sketching will testify.

#### HOURS WITH THE PLAYERS.\*

MR. DUTTON COOK has followed up his amusing *Book of the Play* with two volumes called *Hours with the Players*—the players commented on ranging from the ill-fated Will Mountford to Fichter. In a short preface the author puts forward with becoming modesty a claim for his work that it "contains more precise and complete memoirs of sundry of the performers it deals with than have previously been submitted to the public, or could be forthcoming without considerable diligence, search, and study"; and this is assuredly a claim which few readers of these pleasant volumes will be likely to contest. The writer goes on to observe that it will be easily seen in which cases he has written at second and in which at first hand. "Of course I was in some cases rather a juvenile witness, and not by any means an expert; yet, to pursue the figure, I know the nature of an oath, and I trust my testimony as far as it goes may be accepted, therefore, as credible and trustworthy." In fact, Mr. Dutton Cook throws himself with such zest into his subject, whether he is dealing with early reminiscences or with carefully noted traditions, that we can readily imagine the same remark being made to him that was made to a keen playgoer of our acquaintance by an *interlogue* companion. "You, then, must have seen Mrs. Bracegirdle." For Mrs. Bracegirdle, of whom he says that she "seems to have been the first actress who succeeded in establish-

ing anything like a reputation for private worth and propriety of conduct," the author takes up very properly, as it seems to us, the cudgels against Lord Macaulay, whose passing estimate of her character is oddly characteristic—"It was said of her that in the crowded theatre she had as many lovers as she had male spectators. Yet no lover, however rich, however high in rank, had prevailed on her to be mistress. . . . She seems to have been a cold, vain, and interested coquette, who perfectly understood how much the influence of her charms was increased by the fame of a severity which cost her nothing, and who could venture to flirt with a succession of admirers in the just confidence that no flame which she might kindle in them would thaw her own ice." This is a strange enough comment on a virtue which was then not too common, and most people will agree with Mr. Dutton Cook that it is "severe upon the actress."

As to the death of Will Mountford, the author, after reviewing the circumstances with care and patience, observes that

the public generally were of opinion that a grievous wrong had been done, for which *some one* ought to be punished; and, Will having escaped, why should not his friend Mohun suffer in his stead? . . . Mohun's share in the sad event could only "constructively" be regarded as murder. Certainly he had not struck the fatal blow. He stood apart, little more guilty than a second in a duel—to take the worst view of his case.

This is perhaps putting it a little strongly; but, on the whole, the view of the transaction at which Mr. Dutton Cook has arrived seems reasonable enough. In the same chapter there is a curious confirmation of the notion, which we have on former occasions expressed in these columns, that in the seventeenth and eighteenth centuries the power of acting was, to use a paradox, accounted an extraordinary perfection in an actor. It was said of Mountford in *Sir Courthly Nye* that "he was no longer Mountford, but another person; he was not himself in voice, mien or gesture; the whole man was changed"; and it was this—then, as it seems, strange—faculty of impersonation which put the crown to his reputation.

All Mr. Dutton Cook's biographies in his first volume afford entertainment and agreeably conveyed information; but it is not easy to dwell upon them at any length without picking out the plums, which we do not propose to do. In an article on Palmer, the original Joseph Surface, a reference to that curiously scrappy and amusing book, Frederick Reynolds's *Memoirs*, contradicts a tradition as to the last words uttered by Palmer. He was playing *The Stranger* at Liverpool in 1798, and fell dead upon the stage in the fourth act. It was said at the time, and the legend is still current, that he died immediately after delivering the words, "There is another and a better world." Whittfield, however, an actor who was playing Baron Steinfort, told Reynolds "that Palmer fell suddenly before him on the stage while answering the inquiry as to the *Stranger's* children in the fourth act, and that his last words were really 'I left them at a small town hard by.'" The more striking form of the story sold fifteen hundred copies of the play, and was "most adroitly confirmed and hawked about the town as a means of enforcing the anti-dramatic tenets" of the Methodists. There was also a curious story, told in Mr. Richardson's *Recollections of the Last Half-Century*, of Palmer's "fetch" appearing at the hour of his death to a boy named Tucker, who slept in the house in Spring Gardens where Palmer lodged when in town. It may be noted that in a following chapter Mr. Dutton Cook does fuller justice than has often been done to "Gentleman Smith," whose chief fame rests upon his "creation" of the part of Charles Surface, but whose versatility both in tragedy and comedy must clearly have been remarkable.

More personal interest attaches, as the preface hints, to the second volume than the first, inasmuch as in some of its later chapters the author speaks as an eye-witness. But before we come to them it may be well to say something of a curiously interesting chapter devoted to "a gentleman of the name of Booth"—the father of the actor whose great powers were shown this year on the London boards. The story of the elder Booth's appearance in London, of Edmund Kean's seeming kindness in playing Othello to his Ingo at the theatre where Kean was acting and where he caused Booth to be engaged, and of the complete eclipse of Booth which followed is tolerably well known. What was probably not known to or noted by many people until Mr. Dutton Cook recorded the fact, is that at the date of this eclipse Booth was little more than twenty years old. It may be that even so his performances in London were underrated—the influence of Kean was then paramount—but it seems in any case tolerably certain that in after years Booth displayed, to say the least, a remarkable talent. Mr. Dutton Cook quotes as to this some very interesting passages from a book called *The Tragedian*, by Mr. J. R. Gould, published in New York in 1868. The author writes forcibly and with evident insight, but is undoubtedly carried away by enthusiasm, although he does not make the fatal mistake of asserting that Booth was faultless. He possessed, Mr. Gould says, imagination "of a subtle kind, and in magnificent measure. It lent a weird expressiveness to his voice. It atmospherised his most terrific performances with beauty. Booth took up Kean at his best, and carried him further. Booth was Kean, *plus* the higher imagination." Mr. Gould, it will be observed, had never seen Kean, and the comparison, therefore, cannot be thought worth much; but from various detailed descriptions and criticisms of Booth, for which we refer readers to Mr. Dutton Cook's pages, it would seem that, when allowance has been made for enthusiasm, there is still evidence enough that Booth must have been a good deal more than a mere imitator. It should be noted also as to this that he forestalled Kean in playing *Lear* at Drury Lane,

\* *Hours with the Players*. By Dutton Cook, Author of "A Book of the Play," "Art in England," &c. 2 vols. London: Chatto & Windus.

and that his performance was spoken of by Hazlitt in a way which may be held to mark the predisposition of his audience:—"We have seen Mr. Booth's *Lezar* with great pleasure. . . . Mr. Kean's is a greater pleasure to come, as we anticipate."

The chapter on Booth is followed by one on "La belle Smithson," in which, after the Berlioz epidemic of last season, it is a little strange to find Mr. Dutton Cook writing:—"Some few of Berlioz's works find a place in our orchestral concerts, but the composer himself is little remembered in England." Perhaps the best, and certainly not the least interesting, of the chapters is that devoted to "Sir Charles Coldstream," which contains a full and nicely-judged account of the style and chief performances of the comedian whom the writer justly calls "unique, unrivalled, inimitable," in his own line:—

The histrionic fame [writes Mr. Dutton Cook] of Charles Mathews the second, however, arose from gifts and achievements which were peculiarly and independently his own. His success was of a personal and individual sort, and owed little or nothing to preceding exertions and examples. His method as an actor was not founded upon the method of any other actor. He was essentially a light comedian—the lightest of light comedians; but it was difficult to classify his art in relation to the art of others or to established technical conventions. He was distinguished for an extraordinary vivacity, an airy grace, an alert gaiety that exercised over his audience the effect of fascination. Elegance and humour so curiously combined can hardly have been seen upon the stage except in this instance. No doubt there was always risk of awarding admiration, not so much to the art of the comedian as to the natural endowments of the man; and it must often have happened that Charles Mathews was applauded for being something which he could not possibly help being. At the same time, it must not be assumed that he could only appear in his own character, or that his efforts upon the scene lacked variety. Certain graces of manner peculiar to himself he could never wholly discard; but his power of representation enabled him to exhibit distinct and finished portraits of personages so very different as *Sir Charles Coldstream* and *Sir Hugh Evans*, *Lavater* and *Mr. Affable Hawk*, *Slender* and *Dazzle*, *Young Wilding*, and the villainous heroes of "*Black Sheep*" and "*The Day of Reckoning*," to name no others.

Later on, contrasting M. Got's performance of Mercadet with Mathews's of *Affable Hawk*, Mr. Dutton Cook says that he is without information as to the method of Geoffroy, the original Mercadet. A French critic has observed that Geoffroy's version was far more like M. Got's than like Mathews's, "*bien que son interprétation, caractérisée par une nuance de rondeur bon enfant, différât sensiblement de celle qui a prévalu à la Comédie Française.*" There are two little slips in the chapter we are now considering. We can find no special mention of Mathews's singular feat of acting in *Patter v. Clatter*, and we have the great Frédéric's name spelt without the final *k*; but for this probably the printer is responsible. We close the volumes, which end with a too brief "Note on Fechter," with a regret that Mr. Dutton Cook has not included in his pages Robson and some other players who have been more or less lately among us.

#### THE OLD TESTAMENT IN THE JEWISH CHURCH.\*

PROFESSOR ROBERTSON SMITH has appealed in these lectures from the smaller tribunal of a local ecclesiastical assembly, first to the judgment of a large number of Scottish hearers in Glasgow and Edinburgh, and next to that of the general body of educated and thoughtful readers. The lectures "were written, delivered, and printed during the first three months of the present year," having "their origin in the invitation of some six hundred prominent Free Churchmen, who deemed it better that the Scottish public should have an opportunity of understanding the position of the newer criticism than that they should condemn it unheard." The author rightly urges as "of the first importance that the reader should realize that Biblical criticism is not the invention of modern scholars; but the legitimate interpretation of historical facts"; though the meaning of the sentence would have been more clear if he had described such "legitimate interpretation" as the aim and object of the criticism, or, in other words, of "progressive Biblical science" in all ages. Every ecclesiastical school and every commentator on Scripture is ready to assert that his or their opinion on any matter of Biblical controversy is the one and only "legitimate interpretation" of fact, or doctrine, or prophecy, as the case may be. Professor Smith is necessarily to some extent influenced by such a bias; but, on the whole, his lectures present a very important question of historical criticism, from his own point of view, in a fair, and always calm and dispassionate, mode of statement. By his opponents it will at once be objected that he has put one of their strongest grounds of opposition entirely out of sight; and this we may presume to have been deliberately intended. It is possible that his answer to such an objection may be reserved for a future publication; meanwhile, in the present course of lectures, the argument of probability is based on Old Testament grounds only, and the testimony of the New Testament to the authorship and historical value of the earlier Scriptures is not discussed in any way. It cannot be fairly alleged against Mr. Smith, whatever may be the rhetorical weapons which party bitterness may use against him, that he approaches his subject in any sceptical or unbelieving spirit. On the contrary, the most explicit statements of his belief in the Old Testament as a Divine revelation are to be met with throughout. It may be sufficient to quote, as an instance, the following sentence, which occurs early in the first lecture:—

The Reformation . . . brought the Bible to the front as a living

means of grace; not, as is sometimes superficially imagined, by placing the infallible Bible in the room of the infallible Church, but by a change in the whole conception of faith, of the plan and purpose of revelation, and of the operation of the means of grace.

This may be true of the motive of the Reformers, as the term will be understood by a Scotch Presbyterian; but it is no less true that the popular religious mind is in all ages superficial, and it is probable that, as a fact, the implicit reliance on an infallible Church was popularly replaced to a large extent by reliance on an infallible and therefore uncriticized Book. Nor would the change in common opinion be so great as may at first sight appear. For belief in the existence of an infallible book must presuppose the existence, in some form, of an infallible Church or society of men so far divinely guided as to be, in respect of the reception and tradition of such a book, free from error. And this we may assume to be the current belief of ordinary Protestantism both in England and Scotland, which accepts the Old Testament as a whole on apostolic, and higher than apostolic, authority in the New; and the New Testament in its turn partly upon apostolic and evangelistic authority, and partly on some implied, and perhaps almost unrecognized, ecclesiastical and sub-apostolic authority by which the acts and writings of Apostles and Evangelists were distinguished and attested. It has, for instance, been a not uncommon opinion in recent times that, as all St. Paul's Epistles must have been inspired, it is impossible that any Epistle of St. Paul can have been lost. Behind the critical opponents to the reception of any new opinions as to the authorship, date, or character of the sacred records, there will always be gathered a vast mass of uncritical repugnance to any questioning of the basis upon which the traditional belief as to Scripture rests. Thus, while it is possible for thoughtful and learned men like Professor Smith to accept as equally the Divine law a code of ceremonial precepts whether its date may have been earlier or later by a thousand years, the bare suggestion of an erroneous tradition as to date or authorship is enough, with the great mass of ordinary religious opinion, to imply an utter subversion of the foundations of faith. Admitting, in the face of this prejudgment of the question, that the author may have had good reasons for postponing any reference to the New Testament, we think that the actual opening of his argument has been well chosen in the preliminary inquiry as to what is the origin and character of the received text of the Hebrew Scriptures. This text is commonly known to have been preserved with such scrupulous care that even interlineations in the MS. were reproduced, and that the copies almost resembled the facsimile of a photograph. The existence of various readings was thus made impossible, and a widely-received belief assumes this uniformity to have come down from the date of the original writings. In his third lecture, Professor Smith supports by a careful argument his conclusion "that the fixing of a standard text took place about the apostolic age, or rather a little later than that date, and not at any earlier time." He attributes this work to the Scribes, whose "objects were legal, not philological." "When this text was fixed, the discordant copies must have been rigorously suppressed. The evidence for this is only circumstantial, but it is quite sufficient." Previously to this settlement, "we can be sure that copies of the Bible circulated, and were freely read even by learned men, which had great and notable variations of text"; an assertion which, in the fourth lecture, the author goes on to justify by evidences afforded in the Septuagint. The inference to be drawn from this argument is obvious; since, if the facts are historically certain, and if the Christian Church is unable to attribute inspiration to Jewish Scribes in and after the apostolic age, no such Divine sanction can be claimed for the received text of the Old Testament as would place it beyond the range of philological criticism.

From the text the next succeeding lectures pass to the Canon and its history; and here Professor Smith's guiding principle, "We receive the Bible as the record of revelation," separates him distinctly from the school of critics to whom the Canon is nothing but a collection of writings, chosen, edited, and published according to the literary, political, or ecclesiastical tendencies of Jewish authorities in the later centuries before the Christian era. But in these centuries the Canon was practically confined within "the fixed dimensions in which we now possess it," although its authoritative definition by the Rabbins of Palestine, to the exclusion of all Apocrypha, cannot, in the author's opinion, be dated earlier than the close of the first century A.D. The Jews, of course, accepted this decision; "but Christian theology could not give weight to Rabbinical tradition, and it is thus very natural that many attempts have been made to prove that an authoritative Canon was fixed in the days of Ezra and Nehemiah, while the last prophets still lived." Such attempts, Professor Smith thinks, have failed; and, as he admits at the same time that inspired prophecy had died out, he is of necessity thrown back on a position corresponding to that occupied by Aristotle in his celebrated definition of virtue, where the enlightened conscience of the *φρόνιμος* becomes in moral action the court of final appeal:—

The great mass of the Old Testament books gained their canonical position because they commended themselves in practice to the experience of the Old Testament Church and the spiritual discernment of the godly in Israel. . . . The judgment which theological prejudice might pass on the several books of the record of revelation was controlled by the practical experience of those who found in the Scriptures food for their own daily life; and so in God's providence a result was attained which rested on sounder principles than those of the schools. Throughout the history of the Church it has always been found that the silent experience of the pious people of God has been truer, and has led the Church in a safer path, than the public decrees of those who claim to be authoritative leaders of theological thought.

\* *The Old Testament in the Jewish Church: Twelve Lectures on Biblical Criticism.* By W. Robertson Smith, M.A. Edinburgh: A. & C. Black, 1881.

Such a position, irrespectively of its abstract strength, places the man who desires to propound it between two fires, and calls for the exhibition of great courage and great calmness in creditably maintaining it. In neither of these qualities has Professor Smith shown himself deficient; and in the succeeding lectures he goes on to argue that from this position it is open to a firm believer in Divine revelation to question, and if necessary to contradict, traditional beliefs concerning the date and authorship of many portions of the Old Testament Canon, and to set up in their room, and attempt to establish by proof, the hypothesis that the statute law of Israel must have corresponded to the codes of other nations in the characteristics of variation and progress corresponding with the life and circumstances of the people. The elaborate and detailed argument of the lectures directed to this object does not admit of condensation; but its conclusions lead to a supposed threefold division of the Torah or Law of the Old Testament. Of these, the first is held to be Mosaic, and to contain, in addition to the Decalogue, the code belonging to the wilderness and the early settlement in Canaan; the second Deuteronomic, and to represent the law as laid down by the prophets, and framed as a body of statutes in or about the seventh century B.C.; while the third, or Levitical code, is the law of the Second Temple, of which the basis may be traced in the prophecy of Ezekiel, but which was not developed in its details earlier than the time of Ezra, and perhaps not completed then. "But while the historical student is thus compelled to speak of the ritual code as the law of the Second Temple, it would be a great mistake to think of it as altogether new. Ezekiel's ordinances are nothing else than a reshaping of the old priestly Torah, and a close study of the Levitical laws shows that many ancient Torahs were worked up, by successive processes, into the complete system as we now possess it." A parallel saving clause guards Professor Smith from being supposed to share "the idea of some critics that the Deuteronomic code was a forgery of the Temple priests or of their head, the high priest Hilkiah," which he holds to be "effectually disproved" by the code itself. As, however, he considers that "it was not known to Isaiah, and therefore the reforms of Hezekiah cannot have been based upon it," it may with some reason be objected that an imputation of "forgery" is not disproved by the acquittal of persons hastily charged with it; and that the term, if applicable at all, belongs as much to the framers of the code on Professor Smith's theory as to the Temple priests on the theory which he rejects. In urging the familiar difficulty that many rules of ceremonial and worship contained in the Pentateuch are shown to have been systematically broken in the history of the nation, and that there is no evidence that their existence was at the time even recognized, Professor Smith is fully within his rights as an orthodox Biblical student. His inference is, indeed, open to the reply, which we do not observe him to have anticipated, that the same negative evidence might be alleged against the existence of the Passover, or Feast of Unleavened Bread, as an institution, which he himself assigns to the period of the first, or Mosaic, legislation. But he is not within his rights where he argues, incidentally and perhaps by an oversight, against the existence of a written law in the age of Samuel. "If it lay neglected in some corner of the Sanctuary, who rescued it when the Philistines destroyed the Temple (in Shiloh) after the battle of Ebenezer?" Into no part of the Old Testament history does the miraculous intervention in which Professor Smith firmly believes enter more distinctly than during this period; and it is an assumption of the question at issue to set aside the possibility of the preservation of a "written priestly Torah" coincidentally with the recorded preservation of the Tables of the Law of Sinai.

It is not within our province to offer any opinion on the theological bearing of the hypotheses defended in these lectures. But it is evident that the issues raised are of a character differing materially from those of ordinary historical criticism. The most contradictory and unheard-of theories about the succession of dynasties in Egypt, or the age of the Pyramids, may be maintained without the slightest practical influence upon the course of modern life and thought; but received opinions upon the subjects discussed in these lectures could not be overthrown without involving a reconstruction of the doctrinal systems of many existing religious bodies. Behind the question, whether the historical probability in favour of theories such as are here advocated is sufficiently strong to give them a recognized place in the literature of criticism, lies that of their influence on society generally; and the responsible officers of ecclesiastical communities can hardly be expected to exhibit towards them a receptive frame of mind, even at the risk of being classed with "Scribes" and "Pharisees" among "those who claim to be authoritative leaders of theological thought."

#### MISSING PROOFS.\*

WE always read Miss Stirling's stories with pleasure. She happily keeps free from most of the faults into which so many of her sister novelists fall, and she has merits of her own. She does not ill-use her native language, neither is she one of those who think that, so long as the author provides big enough words,

it is the duty of his reader to find a meaning for them. Considering the times in which she lives, she is sparing in her descriptions of nature, and, where she is somewhat minute in describing a scene, it will commonly be found that she has some reasonable end in view. Thus she sets clearly before us a view of the sea-coast of Pembrokeshire. "Chasms," she tells us, "yawn in the downs, so hidden by brambles and feathery grasses that an unwary walker may step over their treacherous edges, and drop down sixty sheer feet of rock on to the sand below, where the driven sea-foam lies thick and pale." Of course we know at once that through one of these chasms, before the end of the story is reached, some one of the characters who is in the way, both of the heroine and of the author, will be at the right moment dropped. The description, therefore, instead of wearying us, as descriptions so commonly do, only cheers us up, by inspiring us with fresh interest. We survey the group of characters, and begin to speculate for whom it is that the chasms exist. For the villain—of course a lady's story has a villain, one very deeply dyed moreover—they can, it would seem, scarcely be needed, since he was far away in India serving with his regiment against some desperate Bhotanees, and had convenient modes of death enough on every hand. There was a virtuous nobleman, whose life seemed to us uncertain, as, if he were removed, the injured heroine's little son would in that case be only separated by one other life from the family title. There was besides a very hateful, but outwardly attractive, young lady who was ensnaring the virtuous nobleman, and who seemed almost certain, unless he or she were killed, of winning his hand and sharing his title. We could even imagine one or two others who, though less in the way, might nevertheless have been thought not unworthy of a drop down a chasm so as to help on the plot. In like manner we have a full description given of Hungerford foot-bridge on a foggy night, and of the turbid river that flowed beneath it. But here, too, we do not for one moment complain, as the scene is not painted till the heroine was on the point of drowning herself. When a very interesting and lovely young lady in a fit of despair throws herself into the Thames, then surely an author deserves not only indulgence, but actual praise, who checks her narrative in order to describe all that her heroine might have noticed, and in fact perhaps did notice. What does excite our impatience is when, as is so commonly the case, novelists make use of their descriptions much in the same way as stings but ostentatious hostesses make use of their services of plate, merely to hide the scantiness and the meanness of the food that is set before the guests. It may, perhaps, be chiefly due to this absence of descriptive writing that the reader is so fortunate as to get *Missing Proofs* told in only two volumes. What a relief it always is to escape the third volume, and how well inclined do we from the very first feel towards a writer who shows that she intends to let us off so easily! A short visit to one's dentist is a great delight, and so is a quick passage across the Channel. Perhaps a greater delight even than these is a sermon that lasts but ten minutes when we had looked for one that would keep us at least three-quarters of an hour. But to the reviewer pleasanter even than a sermon that is short, than a sea-passage that is brief, and than the stopping of a tooth that is soon got over, is a novel that is short of its third volume. We take it up with a feeling of goodwill, we begin to read it in the hope that we shall be pleased, and however dull we may have found it, we lay it down with some feeling of gratitude towards an author who has only bestowed on us but two-thirds of his tediousness.

We must, however, at once acquit Miss Stirling of being tedious, and confess that we are only speaking in general terms. *Missing Proofs* is certainly an interesting story, though it is in many ways a very faulty one. Of all the author's novels that we remember to have read, it is the one that has, on the whole, given us least pleasure. It is certainly better, in one respect, than *The Graham of Invermay*, which we noticed a year or two ago, for that tale was somewhat spun out. On the other hand, it does not contain, as all her other stories have contained, any very interesting character. There is not a single young lady with whom an old reviewer can fall in love, and this, we can assure Miss Stirling, we feel to be a great privation. No one, we verily believe, loses his heart more easily than a veteran critic, though perhaps no one more easily and rapidly recovers it. Unhappily, so numerous are the heroines by whom he is charmed, that he retains no clear remembrance of any one of them—even their very names slip his treacherous memory. Nevertheless, he looks upon himself as hardly used should a single week pass by without adding one to the list of those who have overcome him. Now the heroine of *Missing Proofs*, Lizzie Mayhew, has, no doubt, considerable merits of her own, though we must protest against the colour of her eyes. Brown is as good a colour for any heroine's eyes as we could wish for—far better than the violet that is at present in fashion, though not in nature. Nevertheless, when the author tells us that Lizzie's eyes were the brown of a Highland torrent-stream, we felt that she might have very easily found a clearer and a pleasanter shade of colour. The skin of a brown bear, or the edges of the crust of a well-baked pie, would have done far better than a stream discoloured by peat. But, passing from the eyes, there is still a greater drawback in the heroine. She gets married before the story is two chapters old, and she marries one of those cold-blooded, handsome officers who have greatly flourished ever since the days of *Vanity Fair* and George Osborne. Now we do like, we are ready to confess, to keep our heroines unmarried till close upon the very

\* *Missing Proofs: a Pembrokeshire Tale.* By M. C. Stirling, Author of "The Graham of Invermay," &c. 2 vols. London & Edinburgh: Blackwood & Sons. 1881.

end of the story. We like, as it were, to feel that there is some hope left even for us, and that we may be able, in spite of all his advantages and our disadvantages, to cut out the most dashing young hero and to carry off the charming heroine for ourselves. Certainly there is some gain to be set off on the other side by this early marriage. The story does not run on in the common rut in which the girl's heart is won even before the reader makes her acquaintance. Miss Stirling, likely enough, felt that a change would be agreeable, if not to her readers, at all events to herself, and so she sought a fresh plot. The villain—for a villain, in spite of some very tardy and very imperfect penitence, Laurence Dempster certainly was—so contrives his marriage that the proofs of it can, if he wishes, be without much difficulty destroyed. He has not made up his mind to cast away his wife, but from the first he wishes to be able to do so should he find it convenient. He is cousin to a nobleman, while she is the daughter of a poor schoolmaster, who has become blind. Moreover, he has one of those rich old aunts, who, by the expectations that they raise, so often lead their nephews into acts of villany. If he displeased her by his marriage, he would, he well knew, be struck out of her will. He never, therefore, acknowledged his wife, and when at last, stung by the scorn that was cast upon her, she says that she will claim her rightful position, he defies her to prove that she is married. She soon finds that the proofs are indeed missing. Certainly by a woman who knew the world, with the help of a lawyer, the difficulty would have been without much trouble surmounted; but Lizzie was as ignorant as a child. She had passed her youth in a country village, and after her marriage she had been kept by her husband under an assumed name in retired lodgings in the town in which his regiment was quartered. The troubles that she suffers during the period of his neglect of her are described with considerable power. One lady only came to see her—the wife of a brother officer who knew the state of the case. On leaving, “thinking it best to make the position clear at once,” she begged Lizzie not to think herself bound to return her call:—

“I know nothing about returning calls, Mrs. Loch,” said Lizzie, impetuously—“neither when one should go, nor how long one should stay, nor what to do with visiting cards. Laurence talks about society till I feel as if there were a great gulf between me and it that I shall never learn to pass. Are people—ladies and gentlemen—so very unkind? I used to think their lives must be so pleasant, and sunny, and gentle. Would they be so severe if I made blunders?”

“Poor child,” said Nelly, compassionately, thinking how society would surely judge in this case. “The very best people are neither unkind nor harsh; but then there are so few of them. I’m afraid many of one’s acquaintances would criticize a blunder far more severely than it deserves.”

“Then you are one of the best people,” said Lizzie, smiling.

“Oh dear, no—not in the sense I meant. I am nobody in this society that alarms you so.”

Lizzie opened her eyes. “I never shall understand, and sometimes I am so afraid, that I grow almost content to live in this way.”

Before long her husband quarrels with her, and to escape from her reproaches changes into a regiment that is bound for India. He leaves, however, money enough to provide decently for her and their infant son. She becomes desperate, and, as we have said, at last finds her way on to Hungerford Bridge on a foggy night. The chapter in which this scene is described ends with a rough “bargee” saying to his mate, “Poor lass, poor lass! she was a main good-lookin’ un, she was.” So far the story, if it takes a melancholy turn for the unhappy heroine, yet, from the reader's point of view, has gone on pleasantly enough, while a fresh and not unpleasant prospect seems to open before him. The heroine does, indeed, seem to have played her part; but heroines have died before, and yet the tale has not greatly suffered. There was still the villainous father left, and left in a place so convenient as India for a rapid death preceded by a scarcely less rapid repentance. But, far more interesting than any villain on the face of the earth, there was the much-wronged infant son, with the chance of a peerage before him could the missing proofs be found. Material enough was provided, we should have thought, to carry the story to an easy issue; but the author was not satisfied, and so made use of that well-known character the twin sister. This young lady—who had, we must not forget to say, two devoted lovers of her own—took advantage of the striking likeness that there was between her and her sister to assume her name, and to pass herself off as the mother of the deserted boy. It was, we must point out, the assumed name that she took, for Mrs. Dempster had been hitherto known only as Mrs. Davis, and it was Mrs. Davis that Judith Mayhew pretended to be. This part of the story struck us as being both laboured and unnatural. In fact, Judith, in the second volume at all events, is a nuisance, and by no means deserves the dashing and honourable young naval officer whom in the end she wins for a husband. Her first attempt had been to trace her sister, whom she had followed up to London, and to learn her fate. But not a word can she hear of her for some years. She had applied to the police, but no information could be got from them. The reader begins to suspect that his interpretation of the “bargee's” words might have been a mistaken one. Whether the heroine was drowned or was not; whether, assuming for a moment that she was rescued from the Thames, she was delivered from her husband; whether, on the assumption that she was delivered from her husband, she got a second and a better one; whether the missing proofs were ever found, or are still missing, all that should not be disclosed by us. If the reader's curiosity is roused, it is not for us

to satisfy it. There are circulating libraries and leisure days, and we shall not rob our author of her right to wind up her story in her own words, and to supply herself, if they are to be supplied, the proofs that are missing.

#### RECENT VERSE.\*

MR. ARTHUR O'SHAUGHNESSY'S premature death this spring, at the age of thirty-seven, gave a pathetic force to the anticipation with which we looked forward to this posthumous volume of *Songs of a Worker*, on which he was known to have been engaged for eight years. Mr. O'Shaughnessy was the first writer of any promise who succeeded the almost simultaneous appearance of Messrs. Swinburne, Morris, and Rossetti; and his early poems, though much weaker than theirs, had a flavour and individuality of their own, which ensured them a hearing. His *Epic of Women*, to which we gave an early welcome in these columns, was as promising a first volume as any young poet has put forth in our time, except Mr. Morris's *Defence of Guenevere*. It had a singularly delicate music of its own, a very simple diction and limpid style, and a vein of mysticism which was full of charm. “The Fountain of Tears,” “Barcarolle,” and “A Neglected Harp,” are lyrics which seem to us now quite as original and beautiful as they did eleven years ago. But Mr. O'Shaughnessy failed, to support his reputation. His next book was a collection of stories paraphrased from Marie de France, versified with great skill and ease, but lax and fluid to a fault. His third book, *Music and Moonlight*, in 1874, which was the last he lived to publish, was still more faulty, containing, indeed, several of the best songs of the decade and one or two very beautiful spiritual studies, such as “Outcry” and “Song of Betrothal,” but otherwise almost unreadable. It is with a genuine sense of disappointment that we are obliged to confess that the process of degeneration has reached an even lower point in the posthumous volume before us. The songs are less delicate and melodious, the reverie more commonplace, the structure more lax than ever. In several of the pieces we recognize the old delicate manner, but the strain has become diluted, and to mix wine with water is to spoil the wine and spoil the water too. The longest poem, “Colibri,” contains about seven hundred lines, but seems to be unfinished. It describes, in verse which is distractingly inchoate and slipshod, the birth and training of a forest child, brought up in the gorgeous climate of Brazil. Tropical scenery was always attractive to Mr. O'Shaughnessy, and he frequently attempted to interpret the impression it leaves on a mind that has been saturated with it. In the *Epic of Women* the beautiful lyric called “Palm Flowers,” and in *Music and Moonlight* the much less successful piece called “Azure Islands,” are examples of this. But “Colibri” will never rank among his successes. The other poems in the volume are original and translated lyrics. The original poems are mostly of an exceedingly pathetic and mournful tone, the sorrow being occasionally redeemed by a flash of mystical and spiritual hope, in the manner which Mr. O'Shaughnessy had made his own. Here is a song which seems to us among the best in the book:—

Love, on your grave in the ground,  
Sweet flowers I planted are growing;  
Lilies and violets abound,  
Pansies border it round,  
And cowslips all of my sowing;  
A creeper is trying to cover  
Your name with a kiss like a lover.

Dear, on your grave, in my heart,  
Grow flowers you planted when living,  
Memories that cannot depart,  
Faith in life's holier part,  
Love, all of your giving;  
And Hope, climbing higher, is surer  
To reach you as life grows purer.

Something of the same tenderness and spiritual purity gives a kind of subdued charm to “Fallen Flowers,” “At Her Grave,” and “Eden.” The longer poem called “Lynmouth” is of a higher order of literary excellence, containing many admirable stanzas such as these:—

The green exuberant branches overhead  
Sport with the golden magic of the sun,  
Here quite shut out, here like rare jewels shed  
To fright the glittering lizards as they run.

And there are perfect nooks that have been made  
By the long-growing tree, through some chance turn  
Its trunk took; since transformed with scent and shade,  
And filled with all the glory of the fern.

The translations are particularly well done. They consist of copious examples from the lyrical work of the latest school of French poetry, with which Mr. O'Shaughnessy had only too dangerous a sympathy. He has selected, however, mainly such pieces as give the English reader a very favourable idea of these

\* *Songs of a Worker*. By Arthur O'Shaughnessy. London: Chatto & Windus.

*Poems*. By May Probyn. —

*Songs of Study*. By William Wilkins. London: C. Kegan Paul & Co.

poets, among whom MM. Coppée and Sully Prudhomme take the foremost place.

Miss Probyn's small and modest volume displays so much brightness of fancy and sweetness of feeling, united to excellent metrical science, that we cannot deny her the attention due to a young probationer of song. Whether her facility and charm will ever impress themselves on the world's ear, which becomes less and less easy to reach as each generation passes, we cannot pretend to say; but she certainly has no place in the ignoble herd of postasters. She appears to belong to the school of Mr. Austin Dobson, and shows her discipleship by the composition of ballades, villanelles, triolets, and even a pantoum. We regard these exercises as extremely beneficial to a young writer in verse, and Miss Probyn has mastered her lesson with ease. But we look upon them rather as a means than as an end, and expect more of the spirit of poetry in simpler productions. Perhaps we shall get the best idea of Miss Probyn's manner by quoting one of her bright and picturesque pages, taken from the quaint poem called "Soapbuds":—

Her arms were white as milky curds;  
Her speech was like the song of birds;  
Her eyes were grey as mountain lakes  
Where dream of shadow stirs and breaks.  
Her gown was white—her name was Sally—  
Her summer years were barely twenty—  
She dropped the soap to glance and dally—  
And then the dimples came in plenty!  
I praised her fingers, dripping sweet,  
Where warmth and whiteness seemed to meet,—  
I made her blush and made her pout,  
And watched her wring the linen out.  
Oh, to meet her in the valley,  
Snatch her hand, and call her Sally!  
Oh, to find her on the hill,  
Kiss, and call her Sally still!  
Oh, to clasp her quite alone,  
And call her Sally of our own!  
Thyme and marjoram were sweet,  
All the lavender was blowing—  
Through the honeysucked heat  
Bees were coming, bees were going.

We would willingly linger longer over this charming little book, which we leave with reluctance, and with the hope of meeting its author's name once more before very long.

Mr. Pakenham Beattie celebrates his affection for the late Mr. O'Shaughnessy in verses that are the only good ones in his pretentious volume. Even here, in the expression of a personal feeling, we find something stagey and insincere in this approach to a young poet of merit as "Mastor," to whom such a one as Mr. Beattie is obliged to draw near "with bowed head and bended knee." This is probably false, it is certainly silly; and it prepares us for the mocking-bird note of spurious enthusiasm which runs through the rest of the book. We have had the æsthetic fop before; this time we have to do with the nihilistic and dynamite fop. Mr. Beattie has read *Songs before Sunrise*, in which a great poet projects his singular transcendental temper of mind upon contemporary politics in a manner which has great literary and sentimental interest, but no political significance. What Mr. Swinburne means is quite beyond Mr. Beattie; but the latter has been struck by several sonorous denunciations of priests and kings, and he tries to produce the same martial melody on a little toy-drum of his own. When a youthful postaster expresses the hope that Prince Bismarck's "bloated body may swell, till the foul soul rot from the festering flesh to find a respite in the pangs of hell," and says of Boris Melikoff,

holy the knife  
That shall be raised against this villain's life,

he is only not criminal because he is simply silly. The want of talent displayed throughout this wretched little imitative volume may be a source of congratulation to its author when he arrives at a period of moral sanity.

All lovers of literature regard the name of Mary Cowden-Clarke with affectionate respect, and the volume of collected verses which she issues in her old age will be received with welcome by those who regard her as now almost the only remaining link between our generation and that of Keats and Haydon. Mrs. Cowden-Clarke has been actively engaged in literature for more than fifty years, and though most that she has written has been in prose, she has not always resisted the charms of verse. In 1856 she ventured on a metrical "skit," which attracted attention, and more readers still will remember her *Love Stories in Metred Prose*. From her new collection we quote a very touching sonnet on the death of Leigh Hunt:—

The world grows empty: fadingly and fast  
The dear ones and the great ones of my life  
Melt forth, and leave me but the shadows flit  
Of those who blisful made my peopled past;  
Shadows that in their numerousness cast  
A sense of desolation, a sharp knife,  
Upon the soul; perplexing it with strife  
Against the vacancy, the void, the vast  
Unfruitful desert which the world becomes  
To one who loses thus the cherish'd friends  
Of youth. The loss of each beloved sends  
An aching consciousness of want that dwells  
The voice to silence—akin to the dead blank  
All things became when down the sad heart sank.

It is very difficult to express a definite opinion on poetry so accomplished and interesting as that contained in Mr. Wilkins's *Songs of Study*. This is a volume mainly filled with Irish lyrics,

full of warm feeling, enthusiasm for landscape, love of life, and earnest emotion, and it is hard to distinguish the purple flush of youth from the more lasting colour of poetry. The principal piece, "Actæon," is the best, and so very good in its way that we are by no means sure that Mr. Wilkins may not retain his vigour and tuneful note when the riot of the blood is over. At present we miss that dominant literary quality without which mere tunefulness can no longer claim critical attention.

#### SOME NEW CLASSICAL EDITIONS.\*

NO Latin poet has been more fruitfully studied in Germany or England within the last forty years than Plautus; and this deservedly, for no author furnishes more light and help towards the understanding of Latin philology, especially if taken *pari passu* with Cicero's Letters. In any retrospect of the period, much help might be derived from a scholarly edition of two plays of Plautus, the *Aulularia* and the *Menæchmi*, in 1839 and 1840, by the Rev. James Hildyard, then Tutor of Christ's College, Cambridge, which was to many young scholars the commencement of a lifelong addiction to Plautine study; and this was supplemented a little later on by lectures on the *Miles Gloriosus*, which, though never published, evinced a thorough insight into the phraseology, prosody, and collateral matter of perhaps the most amusing comedy of this dramatist. Had Mr. Hildyard brought out the *Miles* with a due array of footnotes and critical apparatus, and a glossary to his former plays, there would have been less to learn from the later labours of Ritschl, Lorenz, and Brix—the first of whom is out of print, though the two others have been the constant guides of the learned Professor to whom we owe the present edition. Professor Tyrrell—who occupies the Greek Chair at Dublin, and some years ago gave proof of his facility at Plautine translation in a volume which we reviewed in this journal in 1867 (*Hesperidum Susurri*)—aims in his present work at two ends—to supply scholars and critics with an *apparatus criticus* giving the most recent results of research, and to provide students with a fit introduction to the study of Plautus. With this view he has given an ample, though succinct, introduction in forty-three pages, passing unnoticed no peculiarity of Plautine idiom or scansion, and in many points dealing with the vexed question of the latter of these with a skill which he had partially proved when he translated for the *Hesperidum Susurri* a passage from *The Merry Wives of Windsor*. It need hardly be said that this introduction includes a lucid sketch of the plot, which turns on the help afforded by Periplectomenes, a genial old bachelor host of Pleusides, the lover, to bamboozle the braggart Captain, his next neighbour at Ephesus, who has carried off Pleusides's love, Philocomasium. The task of bringing the lovers together is achieved by several devices, mainly by opening a party wall which separates the house of the kindly old bachelor from that of the Captain, where Philocomasium is imprisoned. Palæstrio and Sceledrus, the faithful slave of the host and the officious, loquacious, and drunken servant of the Miles, are the source of great part of the *contretemps* of the drama, which is, in truth, more sparkling than strictly coherent; the first act bringing in a single scene to illustrate the vanity of the Miles and his parasite, Artotrogus (who nowhere else appears), and the third act, which gives us Periplectomenes's arguments on marriage, though clever and amusing, being quite irrelevant. In a perplexed and tangled passage, however, in the 2nd act, scene vi. 106, &c., Professor Tyrrell seems to us to have unravelled the puzzle by a clever allusion to the *Menæchmi*, ii. 2, 16. Lorenz, indeed, first suspected a lacuna, but neither he nor Brix made sense of it, and so what Professor Tyrrell had to reconstruct was—

Occisam sæpe sapere plus multo suum

\* Qui adeò admutilatur ne id quod vidit viderit, &c.

This he managed by reading the passage, with slight alterations, as follows:—

Sat indepol certo scio  
Occisam sæpe sapere plus multo suum  
Insanos, sed illine opus est plenè hauri suum  
Qui adeò admutilatur ut ne id quod vidit, viderit?

*h.e.* "I know that madmen oft become much more sensible through the slaughter of a sow; but would not this fellow need a whole sty to be sacrificed for him, since he is so cajoled as not to have seen what he actually has seen?" Of course in the lacuna line *illine* = *nonne illi*, as Plautus does not use *nonne*; and the metaphor in "admutilatur," *lit.* of shaving close, or chiselling, is used in

\* *The Miles Gloriosus of T. Maccius Plautus*. A Revised Text, with Notes, by Robert Yelverton Tyrrell, M.A., Fellow of Trinity College, and Regius Professor of Greek in the University of Dublin. London: Macmillan & Co. 1881.

Select *Elegies of Propertius*. Edited, with Introduction, Notes, and Appendices, by J. P. Postgate, M.A., Fellow of Trinity College, Cambridge, and Professor of Comparative Philology in University College, London. London: Macmillan & Co. 1881.

*Æschylus's Agamemnon*. With Introduction and Notes, by Arthur Sidgwick, M.A., Tutor of Corpus Christi College, Oxford, and Assistant-Master of Rugby School. Oxford: Clarendon Press Series. 1881.

*Selections from the best Latin Authors*. By the Rev. Edmund Fowle, Author of the "First Easy Latin Reading-Book," &c., and the Rev. Walter E. Whittaker, B.A., late Scholar of Brasenose College, Oxford. London: Longmans & Co. 1881.

Plaut. *Pers.*, v. 2, 53, and often in Plautus. Where, in the parallel passage of the *Menæchmæi*, Plautus makes Menæchmus S. say "Jube te piari de meâ pecuniâ," "get yourself expiated at my expense," he alludes, as Mr. Hildyard, *ad loc.*, remarks, to the "patrix" whose services are referred to by Poriphecomenos in his caution against matrimony in the famous passage in the third act. Other authorities read plicatricem, a "clothes folder," in that passage, which is very worthy of study as a Plautine *locus classicus*.

But we must turn to another meritorious edition of a classic—Mr. Postgate's masterly *Select Elegies of Propertius*, which, with its elaborate and exhaustive introduction, leaves little for any future editor to alter or amend. Based on the texts of Hertzberg and Bæhrens, that of Mr. Postgate approaches the perfection of exactness, and if anywhere he disagrees with any editor—e.g. Mr. F. Paley—he meets the question boldly. In the introduction we find much curiously minute information, as, for example, when tracing the poet's birthplace—which, like that of so many other great poets, is in the North of Italy—he identifies that of Propertius with the fair and fertile valley between Perugia and the river Clitumnus, even that Asisium which also claims the honour of being the birthplace of St. Francis. On all the vexed questions of the long liaison with Cynthia, we read the carefully weighed reasonings of Mr. Postgate with a certain sympathy for the poet's advocate, and rejoice that the task of doing justice to a character which has been overmuch disparaged has fallen to one of the most acute of our younger scholars. The third chapter of his introduction gives us a high opinion of the author's insight into Propertius's syntax and vocabulary; while in the fifth chapter he deals judiciously with the poet's literary history and his relation to his predecessors. When we come to actual discussion of the poems, it is satisfactory to do so with one so well versed as Mr. Postgate in the turns of his author's manner. See his very first poem, 19-20:—

At vos deductæ quibus est fallax in lunæ  
Et labor in magicis sacra piare locis,  
En agendum domina mentem convertite nostræ  
Et facite illa meo pallent ore magis.

"Come ye, whose deceit would draw the moon from the sky, whose task it is to perfect solemn rites o'er magic fire, come and turn the heart of my lady, and make her paler than my face is pale." Mr. Postgate is disposed to see in "quibus est deductæ fallacia lunæ" those who practise the descent of the moon trick; the genitive being one of definition (see Roby, 1302) and a gerundive being more usual in the place of the participle. On one other noted passage in the second poem we must linger to note Mr. Postgate's nice handling (ii. 21):—

Sed facies aderat nullis obnoxia gemmis  
Qualis Apelleis est color in tabulis.  
Non illis studium vulgo conquerere amantes,  
Illis ampla satis forma pudicitia.  
Non ego nunc vercor, ne sim tibi villior istis:  
Unī si qua placet culta puella sat est.

Hear the faithful translator. "No! their helper was beauty that owed no debt to jewels, like the hues on the paintings of Apelles. It was not their sole aim to hunt for lovers through the town. Chastity, a wealth of beauty, was theirs. I fear not that thou should'st hold me cheaper than those heroines of thine. Whosoever finds favour in one lover's eyes, that maiden is decked enough."

Mr. Arthur Sidgwick's *Agamemnon* deals with a play which will prove wholesome and fruitful study for a sound-headed, well-grounded sixth form boy. One admires the skill with which Mr. Sidgwick gets the well-arranged matter of his introduction (plot, early versions of the tale as found in the *Odyssey*, and moral and religious ideas of the drama) all into less than twenty pages. It has generally been the practice of critics to illustrate the *Agamemnon* mainly by the aid of its glorious succession of choral odes; yet it may be doubted if any of these are more telling than some of the level passages—e.g. where, in the third act, 810-944, Clytemnestra comes forth from the palace and answers Agamemnon's reserved address with a string of two-edged double meanings, which must have been pungent to an Attic audience. After the King's thanks for his return, his remarks to the Chorus about false friends, and his assurances that he will see all settled well for the State, Clytemnestra answers with her hollow ringing speech of mingled professions of honour to the victor, and covert irony from the false lips of an adulteress—a speech beginning with shameless assumption of a chaste matron's conjugal love before others, and the forlorn condition ironically affected in the word *ἔρημος*, 862. Mr. Sidgwick rightly adopts *τέτρηται*, with Ahrens, for *τέτρωται* in 869, regarding the vulgate as flat after *τραυμάτων*, and cites in corroboration Morshead's version, "No network were as full of holes as he." Perhaps the climax of the passage is the fulsome language of Clytemnestra to her husband where she welcomes him as

τόνδε, τῶν σταθμῶν κύνα,  
σωτήρα ναὺς πρότονον, ὑψηλῆς στέγης  
στύλον ποδῆρη, μονογενὲς τέκνον πατρί,  
καὶ γῆν φανείσαν ναυτίλοις παρ' ἑλπίδα,  
κἀλλωτον ἡμῶν εἰσιδεῖν ἐκ χειματος,  
ὁδοιπὺν διψῶντι πηγῶν πῶς—

a high-flown string of encomiums which she puts together to preface the strewing of the victor's path with purple carpets, that is, in keeping with her covert phrase, "Justice may lead Aga-

memnon to a home unlocked for." In this passage, and in those with Cassandra that follow, Mr. Sidgwick has bestowed on the *Agamemnon* the services of an intelligent, shrewd, and ever vigilant commentator. As a taste of his criticism, we may refer to his estimate of what he terms Madvig's brilliant conjecture on v. 1228 of this play. The passage is in a speech of Cassandra, where for the text reading

οὐκ οἶδεν οἷα γλῶσσα μισήτης κυνὸς  
λέξασα, κἀκτείνασα φαιδρόνους, δακὴν  
ἄτης λαβραίνω, τεύξεται κακῇ τύχῃ,

the speaker is generally interpreted to mean that Agamemnon "knows not what things a tongue of the vile she-hound, with long-drawn smiling welcome . . . shall accomplish by evil fate"; where *οἷα* is clumsy, *φαιδρόνους* a strange adjective, and the use of adjective for adverb harsh with *ἐκτείνασα*. In the difficulty Madvig, after Tyrwhitt, ventures a certainly ingenious alteration in *φαιδρόνους* *οὐδ*, and in the next line reads *δῆξεται* for *τεύξεται*. The sense will then be, "knows not what a tongue of the vile she-hound has licked (his hand) and stretched out a joyful ear, and now, like a stealthy curse, shall bite him by evil chance." Mr. Sidgwick is evidently taken by the ingenuity of the reading *δῆξεται* for *τεύξεται*; but, on the whole, is deterred by the violent strain of language from admitting it into the text.

The last book on our list is hardly of the same calibre as the earlier three; but the examination we have bestowed upon it has served to show that it possesses such merits as a shrewd-witted private tutor would care most to ensure, and that these selections from the best Latin authors, both prose and verse, selected in co-operation by two experienced tutors, are excellently accredited, and backed by the judgment of practice and experience. The prose consists of selections from Eutropius, Cornelius Nepos, Livy, Caesar, Pliny the Younger, and Tacitus; the poetry of well-chosen bits from Horace, Virgil, Ovid, Tibullus, Catullus, and Propertius, to which are appended such "helps to construing" as, usually designated *notes*, would be gleaned from the pages of Moberley, Pritchard and Bernard, Conington and Bryce, Orelli, Maclean, and other careful annotators. Perhaps a desideratum still remaining is the constant reference to an acknowledged authority on matters of grammar. But we can speak confidently of the "Latin Selections," even at the point of usefulness to which they have already attained.

#### GERMAN LITERATURE.

DR. BERNHARD SCHWARZ'S visit to Algeria (1) was singularly well timed, and not less seasonable was his determination to collect all possible information respecting the political and administrative condition of the country, and the prospects of French colonization, instead of confining himself to the well-worn track of the ordinary traveller. His visit took place in 1879, two years before the events which have now fixed the attention of the civilized world upon Northern Africa. Without too many dry details, Dr. Schwarz contrives to give a vivid picture of the existing condition of French dominion in Algeria, which contributes to answer the important question how far France may expect to attain her object of converting the Mediterranean into a French lake by the permanent occupation of its northern shores. Any prospect of a real colonization would seem visionary in face of the fact that after fifty years' occupation the number of European inhabitants scarcely exceeded 400,000, and not half of these were French. Nor does there appear to be the slightest probability that the Arabs and Kabyles will ever be Gallicized, as the Gauls themselves were Latinized under the Roman sway. The brilliant side of French colonization is the material—splendid roads, railways, aqueducts, improved harbours, magnificent edifices, public and private, hotels in the Sahara, and post-offices in the gorges of the Atlas. The future of French rule in Africa is exceedingly difficult to forecast, for it is bound up not only with the fortunes of France herself, but with the fluctuations of French public opinion. It is extremely doubtful how far domestic circumstances and the strife of parties will allow the steady persistence in a policy of aggrandizement, regardless of blood or treasure, which would be requisite to subdue Africa from the frontiers of Egypt to the southern limits of Morocco, the acquisition of which latter State Dr. Schwarz fully believes to be contemplated. From this point of view he regards the appointment of a civilian governor as a mistake, and considers that it will be necessary to return to a purely military system. Dr. Schwarz was a witness of the splendid entry of the present Governor-General, M. Grévy, into Algiers, which he describes very graphically. His own visitation of Algeria was very systematic; beginning at Oran, he regularly surveyed the country as far as Constantine, the picturesqueness of which mountain city he describes in the most glowing terms. He further made an excursion into the Algerian Sahara, from Biskra to Sidi Okba, and his account of the natural characteristics of this region is very circumstantial. One of the most useful features of his book is the particular attention bestowed on the physical geography of Algeria, which contributes greatly to render the conditions and prospects of European occupation intelligible.

(1) *Algerien (Küste, Atlas und Wüste) nach 50 Jahren Französischer Herrschaft. Reisebeschreibung, nebst einer systematischen Geographie des Landes.* Von Dr. Bernhard Schwarz. Leipzig: Froberg. London: Williams & Norgate.

Another work of travel of even greater interest, although the interest is much less topographical than biographical, is the publication of the private correspondence, chiefly addressed to members of his family, of the ill-fated Australian explorer, Dr. Leichhardt (2). They extend from 1834, when Leichhardt was a student at the University of Göttingen, to February 1848, when he was on the point of starting on the expedition from which he never returned, and the catastrophe of which is a mystery to this day. They give the most advantageous impression of the writer, who appears as the model of everything the youthful man of science should be—enthusiastic in his pursuits, simple in his tastes and habits, indifferent to material advantages, affectionate in his family relations, and admirably clear-headed and good-tempered. About half the volume consists of letters written chiefly from England, France, and Italy, before his departure for the Antipodes. He had, however, formed the project of Australian exploration at an early date, and it is frequently referred to. It is gratifying to observe how thoroughly such a man felt himself at home in England. France was less congenial to him. The Australian letters throw some light on the circumstances of New South Wales in those days; but, like the others, are chiefly interesting for their portraiture of the writer. The problem of the disappearance of Leichhardt and his party is fully investigated by Dr. Neumayer, whose long residence in Australia lends weight to his opinion. Leichhardt, who in his former expedition had traversed the northern portion of the Australian continent, from Moreton Bay to Port Essington, proposed in the second to cross it from north-east to south-west, from Moreton Bay to Swan River. Two points may be regarded as established—that the party was murdered by the natives, and that it did not reach the line now traversed by the overland telegraph, or some trace would have been discovered. Dr. Neumayer is inclined to repose a certain amount of confidence in some of the reports respecting it which have been received from native sources. One is curious; it refers to the existence of half-breeds in the bush, said to be the offspring of a member of the expedition who for a time escaped the fate of his companions. If this be really true, the fact must be positively ascertained some day.

Dr. Sophus Müller's (3) essay on the employment of animal patterns in early Scandinavian ornamentation seems worthy of the German rendering which it has received at the hands of Herr Mestorf. The study of archaeology contributes materially to the elucidation of the relations between the Northern peoples and the Roman Empire, and many of the facts already ascertained are very curious. Such are the abundance of productions of Irish art in Norway, contrasted with their rarity in Denmark and Sweden, and the indications of commercial intercourse between Scandinavia and the Caliphate of Bagdad.

The philological quarrel (*si riva est, ubi tu pulsas, ego vapulo tantum*) between Dr. Zimmer (4) and Dr. Windisch is indeed animated, but the humour of it can only be enjoyed by persons skilled in ancient Irish. Dr. Zimmer accuses his antagonist of all manner of blunders, allowing, however, that his work may be useful to those who know nothing of the subject—an admission which it is impossible to reciprocate.

Dr. Julius Jung has found a very interesting subject in the provincial administration and organization of the Roman Empire (5). The materials for a complete picture of the social condition of the Roman provinces during the Imperial period are to be found not so much in the pages of classical authors as in inscriptions, laws, and public documents in general. Dr. Jung has diligently examined all these sources of information, and has condensed the results of his inquiry into an agreeable as well as a learned volume, replete, yet by no means overloaded, with erudition, and relieved, when the subject allows, with sketches of important historical passages affecting or elucidating the condition of the people, such as the rebellion of the Bagaudes in Gaul and the Donatist troubles in Africa. Each province is the subject of a distinct chapter, and the entire book deserves to rank as a useful, though subordinate, companion to the great works of Friedländer and Marquardt.

Dr. Georg Schanz's treatise (6) on the commercial policy of England during the latter part of the mediæval period, more especially under the first two sovereigns of the House of Tudor, is a work of even greater research than Dr. Jung's, and is based upon a thorough study of the documents bearing upon the subject in the Record Office and the Venetian and Hanseatic archives, as well as Rymer's *Fœdera* and similar collections. The legislation of the country, especially with reference to domestic manufactures and the import and export of the precious metals, is also the subject of close investigation. Usury, trade-guilds, prices, wages, municipal regulations are all discussed in turn; and the diplomacy of the various European States in intimate commercial connexion with England is abundantly illustrated. Dr. Schanz's

work is by no means light reading, but is entitled to the character of a treasury of information laboriously collected by an amount of research of which subsequent inquirers will be only too thankful to find themselves relieved. The second volume contains a mass of charters, despatches, treaties, and other official documents, with tables of statistical returns.

Dr. Herbst's "Encyclopædia of Modern History" (7) is substantially a biographical dictionary of persons distinguished in history since the beginning of the fifteenth century, although countries also are included, and popular movements such as the Anti-Corn Law League. The execution seems very thorough and careful.

The years 1157-1159 are important in the history of the Church and the German Empire, being the first two years of Frederick Barbarossa, which determined the subsequent bent of his policy and laid the foundation of the great conflict between the Papacy and the House of Hohenstaufen. At this period Adrian IV., the solitary English Pope, sat on the Papal throne—a haughty and uncompromising asserter of the most extreme ecclesiastical pretensions, but inspired to a considerable degree by his Chancellor, Roland Bandinelli, whose disputed election as Pope and the consequent schism form the catastrophe of Herr Ribbeck's able and erudite monograph (8).

Herr Pischon (9) investigates the influence of Islam on domestic life, or social organization, and on the political constitution of Mohammedan States and their relations with unbelievers. In every point of view Islam is pronounced lacking, although Herr Pischon's admiration for the literary genius of Mohammed is almost excessive. It is, in fact, no easy matter to determine whether the inferiority of purely Roman Catholic and Mohammedan countries is to be attributed to their religion, or whether the religion and the inferiority are not both the product of a common cause. It can scarcely be believed that, if the Christian nations of the twelfth century had become Mohammedan, they would now be in as backward a condition as the Turks and Persians; and, if this is not so, it would seem to follow that the religion of the Orientals is rather a symptom than a cause of their general inferiority.

Herr Lippert (10), who has already applied the animistic theories of Mr. Tylor to explain some of the phenomena of Hebrew religion, now attempts a more general application to the religions of the Aryan peoples of Europe in general, especially the creeds of classical mythology and the primitive Germans. He finds everywhere a belief in the personal existence of the spirit after death the groundwork of religion, commencing with the veneration or propitiation of the individual soul, developing into the worship of ancestors, and then, through the deification of the latter, into the conception of gods. There is enough of indisputable truth in this theory to impart a plausible air to the whole; but Herr Lippert, like other framers of hypotheses, seems too much inclined to claim a monopoly of truth for his own.

The most important contribution to a generally agreeable number of the *Rundschau* (11) is Du Bois Reymond's discourse, delivered on the occasion of the Leibnitz anniversary, on "The Seven Enigmas of the Universe." They are, in fact, reducible to two—the difficulty of accounting for the beginnings of things, and of determining the relations of thought and matter, and these Professor Du Bois Reymond avowedly leaves much as he found them. A summary of Dr. Schliemann's life and work is well executed, but presents little novelty. There is an interesting paper on Colonel Huber-Saladin's privately printed biography of Count and Countess Circourt, the amiable and highly intellectual Orleanist couple known to English readers from Mr. Nassau Senior's reminiscences of their conversation and *salon*. Circourt appears to have been a man of extraordinary erudition, which he reserved for his intimates. A sketch of the love adventures of the author of *Siegwart*, Johann Martin Miller, affords an amusing picture of German sentimentality in its palmiest days. Some letters written from Leipzig by a Saxon official, immediately before and after the overthrow of Napoleon at that city, indicate the hatred felt for the French even by their nominal allies. The October number is also above the average, beginning with a characteristic story by Paul Heyse, deftly constructed out of slight materials, and distinguished by delicate grace and finished elegance of style. There is also an extremely interesting paper, partly derived from the despatches of the Baron de Bourgoing, Charles X.'s and subsequently Louis Philippe's ambassador at the Court of the Czar Nicholas, on that potentate's attitude towards the Monarchy of July. Nicholas, warned by Pozzo di Borgo, appears to have foreseen the results of Charles's fatal policy, and to have energetically censured his violation of the Charter. He seems nevertheless to have been quite ready for a general coalition against France, and to have been mainly deterred by the absence of support from England and Prussia.

(7) *Encyclopädie der neueren Geschichte*. Herausgegeben von W. Herbst. 11. Abband 1. Gotha: Perthes. London: Williams & Norgate.

(8) *Friedrich I. und die Römische Curie in den Jahren 1157-1159*. Von Walter Ribbeck. Leipzig: Veit & Co. London: Williams & Norgate.

(9) *Der Einfluss der Islam auf das häusliche, sociale und politische Leben seiner Bekenner. Eine culturgeschichtliche Studie*. Von C. N. Pischon. Leipzig: Brockhaus. London: Williams & Norgate.

(10) *Die Religionen der Europäischen Culturvölker, der Litauer, Slaven, Germanen, Griechen und Römer, in ihrem geschichtlichen Ursprung*. Von Julius Lippert. Berlin: Hofmann. London: Williams & Norgate.

(11) *Deutsche Rundschau*. Herausgegeben von Julius Rodenberg. Jahrg. VII. Hft. 12.—VIII. Hft. 1. Berlin: Paetel. London: Trübner & Co.

The idea that England, even under a Wellington Ministry, could have been induced to join in such a crusade, might, if it had been known, have prepared the world for the Osar's still more serious misapprehension of public feeling at the time of the Crimean war. M. Gambetta is the subject of a very lively article, mainly derived from the graphic reminiscences of M. Daudet, and couched in a much more eulogistic strain than could have been expected from a German writer. Ferdinand Miller makes an agreeable addition to the literature of "Dialogues of the Dead" in a vision where he holds converse with the shades of departed poets and musicians.

"From Rock to Sea" (12) is a new miscellany, somewhat in the style of Westermann's *Monatshefte*. The literary matter is good, including contributions from Kinkel, Augengruber, the African traveller Nachtigal, Robert Ilyr, and other writers of repute; and, in particular, the commencement of a new novel by E. Werner, "The Egotist." The illustrations are copious and admirable.

(12) *Von Fels zum Meer*. Bd. I. No. 1. Stuttgart: Spemann. London: Williams & Norgate.

#### NOTICE.

We beg leave to state that we decline to return rejected Communications; and to this rule we can make no exception.

#### PARIS.

Copies of the SATURDAY REVIEW may be obtained every Saturday of M. FOTHERINGHAM, 8 Rue Neuve des Capucines.

## THE SATURDAY REVIEW

OF

POLITICS, LITERATURE, SCIENCE, AND ART.

Price 6d.

CONTENTS OF No. 1,365, OCTOBER 15, 1881:

Arrest of Mr. Farnell.	Mr. Gladstone on Ireland.	Mr. Gladstone's Speeches.
English Policy in Egypt.	The Conservative Leaders at Newcastle.	The Church Congress.
Mr. Gold's Speech at Dublin.	Home and the Pope.	The Great Go-between.
Brittany.	Ghosts in the <i>Daily Telegraph</i> .	The Report on Legal Procedure.
The Author of Don Quixote.	Voluntary and School Board Schools.	Angling Literature.
Critics and Teachers of Music.	The Modern Rough.	The Rise in the Bank Rate.
The Cesarwitsch.	The Imperial Gazetteer of India.	Galland's Journal at Constantinople.
Art in Metal.	With the Kurram Field Force.	Hours with the Players.
Missing Proofs.	Recent Verse.	The Old Testament in the Jewish Church.
German Literature.	Some New Classical Editions.	

London: Published at 38 SOUTHAMPTON STREET, STRAND, W.C.

### ADVERTISEMENTS.

**DORÉ'S GREAT WORKS, "CHRIST LEAVING THE PRÆTORIUM," "CHRIST ENTERING JERUSALEM," and "MOSES BEFORE PHARAOH,"** each 23 by 35 feet; with "Dream of Pilate's Wife," "Christian Martyrs," &c. at the DORÉ GALLERY, 38 New Bond Street. Daily, Ten to six.

**UNIVERSITY COLLEGE, LIVERPOOL.** The Council of University College, Liverpool, are prepared to appoint a PROFESSOR to each of the following Chairs:

1. Modern Literature and History.
2. Natural History (including Zoology, Botany, and Geology).
3. Logic, Mental and Moral Philosophy, and Political Economy.

The work of each Chair will commence in January 1882. The stipend of each Chair will be £200 per annum, together with two-thirds of the fees, the total stipend being guaranteed to be not less than £400 per annum. Candidates are requested to send in their applications, and copies of their testimonials, to the Honorary Secretary, not later than November 1, 1881.

July 5, 1881.

W. J. STEWART, Hon. Sec.

35 Lord Street, Liverpool.

**UNIVERSITY COLLEGE, LIVERPOOL.** LECTURERS IN FRENCH and GERMAN are REQUIRED, who will be expected to commence work not later than the middle of January next. The fixed salary will be small in amount, but the Lecturers will receive the whole of the fees paid by the Students attending their classes, and will be at liberty to undertake Private Tuition. Applications, with testimonials, to be sent in by November 15, to the HON. SECRETARY of University College, 35 Lord Street, Liverpool.

**PUBLIC READING AND SPEAKING.**—The Rev. ALEX. J. D. DORSEY, B.D., late Lecturer at Corpus Christi College, Cambridge (Chancellor's English Medalist), Lecturer on Public Reading and Speaking in King's College, London, receives PUPILS at 15 Prince's Square, W.

**THE Rev. J. H. CROSS, M.A.,** receives a small number of GENTLEMEN'S SONS to prepare for the Public Schools. High testimonials. Great advantages. Address, 31 Sussex Square, Brighton.

**MILITARY and CIVIL SERVICE EXAMINATIONS.**—There is a Department in connexion with BLAIR LODGE SCHOOL, POLMONT STATION, Birmingham, for preparation for the above Examinations. Honours gained during the past year. Three Appointments to Woolwich Academy. Seventh Place for Indian Civil Service. &c. &c. Full particulars on application to the HEAD-MASTER.

**WOOLLEY GREEN, near HURSLEY HANTS.**—A. M. HEATHCOTE, B.A., Organ Coll., Oxford, prepares YOUNG BOYS for Public Schools, &c. Number under Twenty. Two Resident Assistant-Masters. The house is quite in the country, and in a healthy position. Full particulars on application. Address, Woolley Green, near Homsby.

**INDIAN BOYS.**—Rev. R. A. OAYLEY desires to make a HOME for Two or Three (brothers preferred), aged from Eleven to Sixteen, and to send to Public School with his own Sons. For terms, &c., apply Scamptown Rectory, Lincoln.

#### TRINITY-COLLEGE SCHOOL, STRATFORD-ON-AVON.

The Warden, RICHARD CURRY, M.A., is assisted by Seven Resident Graduates, Masters, two being specially for Modern Languages. Special preparation for the Universities, Army, and all competitive Examinations. Exhibition to the Universities of £50 per annum. Junior Department for Young Boys. Large Playing Fields, Gymnasium, &c. &c. Turned in and 50 Guineas. Apply to the WARDEN.

**SOUTH OF FRANCE.**—An OXFORD M.A., and Barrister-at-Law (Married), an experienced and successful Tutor, residing in his own Villa, which is most beautifully and healthily situated one mile from the town of Hyeres, receives SIX PUPILS in delicate health, who are prepared for the Universities, &c. Highest references. Address, W. HENRIY CHATRA, Les Rosignols, Hyeres (Var).

**TUITION at ST. LEONARDS-ON-SEA.**—A Married CLERGYMAN (M.A. Oxon), without family, has vacancies for PUPILS to prepare for Public Schools or Universities. All former Pupils have passed successfully. Only Three received. Comfortable home a few minutes from the Sea. Highest references. Address, Rev. K. HOWARD, 7 Church Road, St. Leonard's-on-Sea.

**PREPARATORY SCHOOL for SONS OF GENTLEMEN,** ST. LEONARDS-ON-SEA. Situation most healthy; sanitary arrangements perfect. Special care of delicate or very young Boys. References to Parents of Pupils. For Prospectus address, Rev. W. HARRIS, Falkland House, St. Leonard's-on-Sea.

**THEOLOGICAL, UNIVERSITY, MILITARY, CIVIL SERVICE,** and other EXAMINATIONS.—PUPILS rapidly and successfully prepared. Terms moderate. Highest references. Address, Rev. W. H. BOWLANDSON, Great Braxted, Witham.

**EDUCATIONAL HOME for the DAUGHTERS of GENTLEMEN.**—THE GRANGE, Emden, BONN-ON-THE-RHINE, Germany. Number of Pupils limited to Twelve. Refined English home. Resident North German and Parisian Governesses. High-class Masters for accomplishments. Unexceptionable references. Apply as above, to the Directress, Mrs. BURNER.

**LADY B.** wishes to recommend very highly a SCHOOL on the South Coast, where her son has been educated several years. The education given is thoroughly good, and the domestic arrangements are excellent. The Head Master is an Oxford M.A., and a Clergyman. Address, LADY B., care of Mr. F. Golding, Bookseller, Minster Street, Reading.

**SECRETARY, CASHIER, or CONFIDENTIAL CLERK.**—An APPOINTMENT DESIRED by a GENTLEMAN, of considerable business experience, well accustomed to Book-keeping, Correspondence, and the financial part of business. A moderate salary only required. The highest references can be given as to integrity and trustworthiness. Address, 11, 9 Villa Road, Brixton, S.W.

**A RESPECTABLE COUPLE,** giving up housekeeping, would be glad to meet with a SITUATION of TRUST, town or country. A nobleman or gentleman with thing or shooting box would find them capable of doing all required; have been in good families. Address, J. M., 7 Bayham Street, Camden Town.

**HAMPSTEAD.**—SOUTH HILL PARK GARDENS, within five minutes of Hampstead Heath Station, N. London.—TO BE LET or SOLD, a Freehold Double-fronted HOUSE, containing fourteen rooms, also bath-room, with a constant supply of hot and cold water. Reception and Bed Rooms most conveniently arranged. Domestic offices on ground floor; good garden at the rear. The house is in thorough repair, and most pleasantly situated. For particulars apply to Mr. DOLMAN, House Agent, 63 Haverstock Hill, and 60 Queen Victoria Street, E.C.

**TO BE LET, FURNISHED,** for a long or short term, a Lady's HOUSE, in South Kensington, within ten minutes' walk of Earl's Court and West Brompton Stations. Contains Dining and Drawing Rooms, Library, and five Bedrooms, and good domestic offices. Rent moderate. Address, A. B., 36 Calvert Road, S.W.

**HYERES.**—TWO GOOD VILLAS (Eleven and Six Bedrooms) TO LET. Best sanitary arrangements. Address, S., English Bank, Hyeres.

#### HOTELS.

**BRIGHTON.**—BEDFORD HOTEL.—Facing Sea and Esplanade. Near the West Pier. Central and quiet. Long established. Suites of Rooms. Spacious Coffee-room for Ladies and Gentlemen. Sea-Water Services in the Hotel. BENJN. BULL, Manager.

**ILFRACOMBE HOTEL.**—On the verge of the Atlantic, in its own Grounds of Five Acres, with Tennis Lawn. Contains 250 Rooms, and is "a model of sanitary excellence." One of the largest Swimming Baths in England; also Private sea-water Baths. Every information of MANAUK.

**TOTLAND BAY, Isle of Wight, near Alum Bay.**—TOTLAND BAY HOTEL. Magnificent sea view. Comfort, with moderate charges. Billiard-room and tennis lawn. Bracing air. Excellent sands and promenade. Good anchorage for yachts. Special train and boat service, Friday, 2.15 P.M., returning Monday, 7 A.M.—Apply to Miss FLEMING, Manageress (late of the Langham Hotel).

**BEDFORD HOTEL, BRIGHTON.**—FAMILIES or GENTLEMEN intending to visit the Hotel are respectfully solicited to address their applications for rooms as early as possible, the Manager being very desirous of not disappointing his esteemed patrons.

#### "MACNIVEN & CAMERON'S PENS ARE A TREASURE."

Just Out, Standard. THE "BIG J" PEN and THE "BIG WAVELEY" PEN, 6d. and 1s. per box. Sold by all Stationers throughout the World. 1,745 Newspapers recommend Macniven & Cameron's Pens. They come as a boon and a blessing to men. The Waverley, the Owl, and the Pickwick Pen. Specimens sent, all kinds, by post in 1d. PATENTERS: MACNIVEN & CAMERON, 21 to 33 Blair Street, Edinburgh. Penmakers to Her Majesty's Government Offices. (Est'd. 1870.) Beware of the party offering imitations of these Pens.

#### SPECTACLES versus BLINDNESS.

ONE-FOURTH of those suffering from blindness can trace their calamity to the use of common spectacles or lenses imperfectly adapted to the sight. Mr. HENRY LAURANCE, F.R.S., Oculist Optician, PERSONALLY adapts his Improved Spectacles at his residence, 1 Finsbury Gardens, Euston Square, London, daily (Saturdays excepted) ten to four. MR JULIUS BENEDET writes:—"I have tried the principal opticians in London without success, but your spectacles suit me admirably. The cleanness of your glasses, as compared with others, is really surprising." DR. BIRD, Chelmsford, late Surgeon-Major, W.E.M., writes:—"I could not have believed it possible that my sight could have been so much improved and relieved at my age, 82. I can now read the smallest print, although suffering from cataract on the right eye." Similar testimonials from Dr. Radcliffe, Consulting Physician, Westminster Hospital; Ven. Archdeacon Palmer, Chichester; Major-General Purkin, C.B., Aldershot; the Rev. Mother Abbess, S. Mary's Abbey, Hendon, and hundreds of others. Mr. Laurance's Pamphlet, "Spectacles, their Use and Abuse," post free.

#### DECORATION.

**MORANT & CO.,** having for many years carefully studied the best periods of Decorative Art, and having had great experience in carrying out important orders, will advise upon the DECORATION and FURNISHING of TOWN and COUNTRY HOUSES, prepare Designs, and execute the necessary works at moderate cost. MORANT & CO. personally superintend all work entrusted to them.

91 NEW BOND STREET, W.

**FURNISH YOUR HOUSE or APARTMENTS** THROUGHOUT on MORRIS'S HIRE SYSTEM. The original, best, and most liberal. Cash Prices, no Extra Charge for time given. Large, useful Stock to select from. Illustrated priced Catalogue, with Terms, post free.—34, 36, and 38 Tottenham Court Road, and 19, 20, and 21 Morwell Street, W.C. Established 1852.

**CHRISTMAS PRESENTS.**—Nothing is so highly appreciated as a case of GRANT'S MORELLA CHERRY BRANDY, which can be ordered of any Wine Merchant. Queen's quality, as supplied to Her Majesty, &c. per dozen. Sportsman's special quality, &c. per dozen.—Manufacturer, T. GRANT, Distillery, Macclesfield.

### IRELAND AND THE GOVERNMENT.

ALL loyal subjects are at present bound, without distinction of party, to support the action of the Government in Ireland. There is reasonable cause for discussion whether the task of restoring order ought not to have been undertaken long ago; and, on the other hand, Ministerial apologists are at liberty to contend that the proved reluctance of the Government to employ extraordinary measures has tended to produce the unanimity which now prevails among all reasonable politicians. The very awkwardness of Mr. GLADSTONE's recent proceedings is perhaps an additional proof of good faith. No other statesman would have made an elaborate speech against an opponent whom he was about to arrest as a public enemy; but no one, except Mr. GLADSTONE, would have failed to anticipate the comments which his words and his acts were certain to provoke. He would not have directed the issue of a warrant against Mr. PARNELL immediately after his Wexford speech if he had been conscious that he could be charged with personal motives. The two warrants follow the words of the Coercion Act in charging Mr. PARNELL with two separate attempts to interfere, by methods of intimidation, with lawful acts. Legal documents not unfrequently seem to lay exclusive stress on comparatively venial offences. Mr. PARNELL's speeches about the Land Act, though malignant and mischievous, are among the least criminal of his utterances during the past year. It is now stated that a third warrant has been issued on a charge of treasonable practices. It is on similar grounds that Mr. DILLON has been rearrested, and that several of the other ring-leaders have been seized. It is more satisfactory to grapple with the promoters of rebellion and anarchy on the issues which they have virtually raised than to accuse them of minor infringements of common or statute law. Those of their accomplices who may escape to England may, without reference to any Coercion Act, be lawfully apprehended if they have dabbled in treason or treason-felony.

The information on which the Government now relies must have been obtained within a few days. It is incredible that Mr. GLADSTONE should have described Mr. DILLON's character and conduct in terms of gratuitous and unqualified enology, if, when he spoke at Leeds, he had known or believed Mr. PARNELL's principal lieutenant to be, in the legal sense, a traitor. It is true that on the same occasion Mr. GLADSTONE declined to express a formal condemnation of the Land League, which the Government has now determined to suppress as an undoubtedly dangerous conspiracy; but he then thought that one of the branches of the League was disposed to accept his Land Act. The proclamation of the Government against the League may have been less unexpected by the leaders of the party of disorder than was the letter from Archbishop CROKE condemning their Manifesto. It may now be hoped that the present inmates of Kilmainham will not be wantonly released, as Mr. DILLON and the turbulent priest SHEEHY were set at liberty to resume their dangerous practices a few weeks ago. The question will be not only whether certain districts are more or less quiet, but whether suspected traitors can safely be permitted to prosecute their enterprise. There must be some legal proof which has satisfied Mr. FORSTER of their guilt; and their moral complicity with projects for the violent dis-

ruption of the United Kingdom would scarcely be disputed by themselves. The coarse and blustering telegraphic messages from America which have been read amid applause at every Land League meeting involved those who accept them in the responsibility for promoting civil war. The daily outrages which have been perpetrated at the instigation of the Land League supplied an additional though unnecessary interpretation of the speeches of the leading demagogues. It is not to be regretted that systematic attacks on the fundamental principles of civil society should bring those who commit them within the purview of the criminal law. Exhortations to tenants to refuse payment of rent, backed by threats which in case of refusal are habitually exercised, are in themselves crimes of an aggravated order. Ulterior projects of renouncing allegiance to the Crown are not more culpable, but the offence may in some cases be more tangible. The quibbling denials of Mr. PARNELL's guilt which his followers combine with praises of his revolutionary activity are founded on his avoidance of explicit recommendations of violence and murder. When the chief of an organized association directs his followers to prevent the payment of just debts, he is responsible, not only for the illegal object, but for the lawless methods by which it may be attained.

The affectation of regarding with horror the exercise of the exceptional powers conferred on the Government was perhaps exhausted during the debates on the Coercion Bill. When Englishmen are warned not to exult over the incarceration of Mr. PARNELL and his confederates, some of them who stand in no need of any similar caution will unhesitatingly refuse to feel or profess either sympathy or regret. The managers of the Land League have from day to day during nearly two years encroached with shameless injustice on the liberty of large bodies, perhaps of the majority, of their countrymen. They have instituted and maintained a system of tyranny which has been often and justly compared to the despotism of the French Committee of Public Safety. Peaceable subjects who asserted a legal claim have been prevented from recovering their lawful debts; and tenants who were willing to pay have been exposed to brutal cruelty. The leaders, hoping to keep the law out of the meshes of the law, have for the most part abstained from formal approval of assault or arson, though Mr. DILLON extenuated the mutilation of cattle. Mr. PARNELL on at least one occasion justified the commission of an atrocious murder by the remark that it should have been unnecessary if there had been a branch of the Land League in the district. The demagogues knew that their power rested on fear of the violence which was systematically practised and threatened by their followers. For some time past they have connived, and more than connived, at the social excommunication of every Irishman who attempted to assert his personal liberty. Unoffending householders have been boycotted because they refused to light up their windows when it pleased Mr. PARNELL to pass through the streets in triumph. Scruples against temporary interference with universal terror and oppression are among the vilest forms of cant. Law exists for the protection of life, of liberty, and of property, and the machinery is only valuable as it conduces to the purpose for which it is constructed. If the ordinary law becomes inadequate, its defects must be supplied; and the responsibility of exceptional measures rests with those who render them necessary. The imprisoned demagogue, in a pro-

clamation which is perhaps more wicked than any of their former acts, ironically argue that the tenant-farmers cannot have been coerced into measures by which they profit. It is against the dissentients that cruel oppression has been practised in detail. That such a document should have been allowed to issue from a prison is the most surprising proof of official imbecility.

It was high time for the Government to abandon the idle pretence of treating the Land League as a lawful association. The rapid blows which were struck at its principal leaders in succession would have been inconsistent with a toleration of the same practices under the guidance of humbler agents. There are many calculating patriots who would be glad to obtain notoriety and incidental pecuniary advantages by the cheap martyrdom of a short residence in a comfortable prison. Every general or local meeting of a Land League is dangerous to the public peace; and the Government has done well in taking judicial cognizance of its undoubted tendency. It may well be expedient to relax the restrictions which have been imposed on the use of their arms by the police. Their courage and fidelity are beyond all praise; but it may not be safe to trust their endurance in unequal contests too far. Humanity would perhaps incline to give armed mobs a sharp and early lesson, before riots expand by reason of impunity into insurrection. By this time even the Birmingham section of the Government must have learned that if force is no remedy, lawless force becomes irresistible. A great many deaths and a vast amount of misery have been caused by deference to the paradoxical opinions of Mr. BRIGHT and Mr. CHAMBERLAIN. They may now perhaps excuse themselves by the contention that it was necessary in the first instance to try the experiment of agrarian concession; and they may even admit that in the last resort force is a remedy. It is still allowable to hope that it may prove sufficient now that it is employed by the Government in earnest. The loyal inhabitants of Ireland and nearly the whole population of Great Britain will cordially support the authorities in the restoration of order. There is no reason to fear that the Ministers will be guilty of undue severity or excessive vigour; yet some critics, long familiar with Liberal commonplaces, may be allowed to cherish historical doubts whether the stern suppression of rebellious movements by the Governments of former generations was not more expedient and more merciful to all concerned than the tardy justice now administered to Ireland.

#### FRANCE AND TUNIS.

AT last the great expedition to Kairwan, so long talked of and so often delayed, seems on its way. A month ago it was supposed that the road to the holy city lay open and everything was arranged for the attack. ALI BEY, with his Tunisian forces, was to guard the line of the French railway and maintain tranquillity in the north, while the French were to march southwards, and be helped by a division operating from the eastern coast. But this plan had to be abandoned. ALI BEY, far from being able to maintain tranquillity or guard the railway, was so hard pressed by the insurgents that he was only saved from destruction by his French friends coming to assist him, while Arab marauders destroyed the railway and cruelly murdered the railway officials who fell into their hands. So insecure was the hold of the French on the country that they determined, although not without some reluctance, to occupy Tunis itself. It was a striking departure from the position assigned to them by the treaty of May, but military reasons made the occupation indispensable. If there had been a rising of the native population in the capital, and the foreign residents had suffered from the terrible excesses to which the rising would have inevitably led, the complaints that France had wantonly created dangers against which she could give no protection would have been loud and serious. It concerned the honour of France that she should use the physical force she possessed in order to avert evils which would never have been imminent unless she had chosen to upset a state of things in Tunis in which foreigners were perfectly safe and contented. The Arabs, too, seem to have seen in the reluctance of the French to occupy Tunis a sign that their enemies were only half-hearted in the prosecution of

the war, and were afraid to take a step that would mark that Tunis was to be treated as a conquered country. The object of attacking Kairwan is of a very similar kind. It is only slightly fortified, and is not a strong military position or a key to a country of any great natural value. But it is a very holy city—a city untainted for centuries by the hostile tread of the infidel, a city every stone of which is rich with some religious memory; a Mecca—although, of course, a very inferior Mecca—of the West. That infidels should defile this sanctuary, should kill its saintly defenders, and hold it as their own, seemed to the Tunisian Arabs something too audacious and horrible to be believed. The French wish to cure these simple people of the delusion that the French army is more afraid of going to one place than to another. It goes to Kairwan because the Arabs thought it would not dare to go there, and because it is hoped that, if the Arabs see that with all their desperate efforts they cannot save the holy city, they may think that there is not much left that is worth fighting for. The actual capture of the place will not probably cost the French any very serious trouble. Their difficulty is not to take Kairwan, but to get to it. Every drop of water needed by the troops and the baggage animals must be taken with the expedition, as the Arabs have destroyed the wells on the route. Flying bands of insurgents will harass the columns, and the Arabs have shown great audacity and great rocklessness of life in the operations which they have hitherto carried on. But it is not so much in the character of the enemy, or in the strength of the city, as in the difficulty of the route itself, that the French have seen reason to anticipate that they will have serious obstacles to overcome.

The French army has as yet done very little in Tunis, and it was so confidently expected in France that the army had only to show itself in a little barbarous State like Tunis to bring everything into order, that a cry has been raised of gross incompetency on the part of the military authorities, and even of a general failure in the whole scheme of army organization. There is, as usual, some truth and some exaggeration in these hostile criticisms. Much of the blame that has been thrown on the army ought to fall on a very different set of persons. The army has had its difficulties increased tenfold by the civilians who form the Ministry that tells it what to do and what not to do. M. ST. MLEIRE was so anxious to make the world believe that he had settled everything by a stroke of the pen, and that his famous treaty was the beginning and end of the Tunis complication, that he at once recalled the troops by whose presence the treaty had been extorted. Later on, the one thing the Ministry thought of was the elections; and what it desired above all things was that, at the time of the elections, France should think as little about Tunis as possible. The French army has done little, because, among other reasons, it did not suit the Ministry that it should do much. Then, again, it must be noticed that the performances which are demanded of the French army are by no means easy of execution. What it has to do is to acquire a firm hold of a country with a very trying climate, in which the whole population is against the invaders, and where those who fight never come, if they can help it, to close quarters. Still there is little room for doubting that there have been distinct signs of inefficiency, not in the troops themselves, nor perhaps in their officers, but in the machinery for conveying and supplying the army. The French navy may be all that its friends say it is, but it seems to have been very unequal to the task of supplying the necessary number of transports. The health of the troops has been very indifferent, but this was unavoidable if France chooses to have a Foreign Minister who appropriates a country like Tunis in a month like May. But the sufferings of the troops have been greatly aggravated by the almost total absence of an adequate medical staff. This is the most distinct blot on the organization of the Tunis army that can be pointed out. But it is incontestable that the Tunis expedition has disclosed a serious defect in the general army organization of France. Competent observers, and among them German observers, who have the keenest interest in observing accurately, have lately borne testimony to the great progress recently made by the French army. In many ways the new organization has been a great success; but then it has been a success only for the purpose for which it was created. That purpose was a war with Germany. The only thought in the minds of those who

framed and have carried it out was how to mobilize rapidly and maintain effectively an army fit to stand against the victors of Sedan and Gravelotte. The possibility of France having to send off by sea an expeditionary force was left entirely out of account. When troops had to be sent to Tunis, there were no regiments, or very few, whose special business it was to go. In order to give as little offence as possible, and to be fair all round, one battalion out of every four was told to go, or to hold itself in readiness to go. The evil of this was that the officers of a higher rank than those attached to each battalion had no knowledge of the men and inferior officers under their command, and there was none of that cohesion which belonging to the same *corps d'armée* is supposed to give. Further, the most efficient men in the battalions sent ought to have been those whose time was nearly expiring, and who in time of peace are sent home, but in time of war are liable to serve their full time. General FARRE ordered these men to serve their time and go to Tunis; but their friends made such an outcry, and the elections were so near, that General FARRE rescinded the order. In a war with Germany these men would have served without a murmur, and all the four battalions would have been equally employed. What France needs is not to change its general military organization, but to supplement it by providing for expeditions like that to Tunis.

The French Ministry will probably be vehemently attacked before it is allowed to gain the repose it longs for, and the chief ground of attack will be the Tunis expedition. If it is spared on this head, it will only be because its adversaries will find it personally rather difficult to explain what it is of which they complain. At the time of the elections no candidate, Republican or anti-Republican, except perhaps some of the Irreconcilables, made any objections to the policy of M. ST-HILAIRE. As a rule, all candidates omitted any reference to Tunis. They, like the electors they were addressing, had no opinions about the Tunis expedition, and did not wish to have any. They were content to wait and see what turned up—ready to say that they had always thought it a good thing if it succeeded, or that they had always thought it a bad thing if it failed. Things have gone on in an unpleasant manner in Tunis lately, and so the Ministry is to be blamed. It deserves very great blame, for it guided France very badly. It made a gigantic blunder. It announced that France was mistress of Tunis directly a military promenade ended in the signature of a treaty. What it represented as the end of imaginary difficulties has proved to be the beginning of very real difficulties. But all this was known, although not perhaps to the full extent, at the time of the elections. There is nothing really new in regard to Tunis since then. The Cabinet, it is said, hopes that there may be something new, and that the capture of Kairwan will come in time to give it a little glory. As the French propose to take Kairwan, it will, no doubt, be satisfactory to them to have carried out their intention; but their position in Tunis will be very little altered. They will have conquered one more section of a country which is not worth conquering; and, if they will have made themselves more feared by the population, they will also have made themselves, if possible, more detested.

#### MR. GLADSTONE ON THE GOVERNMENT OF LONDON.

IN his speech at the Guildhall Mr. GLADSTONE announced to the Corporation its coming doom with remarkable boldness, and at the same time with unimpeachable good taste. There is no point on which the citizens of London are so unanimous as in their desire to maintain intact their ancient and cherished municipality; but such is the charm of eloquence that they applauded, though they perhaps scarcely understood, the announcement that, as soon as Parliament has leisure for the task, the Lord Mayor, the Aldermen, the Common Council, and the Livery will be relegated into the long list of extinct institutions. Another Mayor and other Aldermen will preserve the nominal tradition of City greatness; and they will reign over a far larger territory and population. As Mr. GLADSTONE gracefully assured the existing and moribund dignitaries, nothing will be done "to degrade your great Corporation, or to impair its efficiency. New dignity, new energy, and a further enlargement of public con-

fidence, fresh record of good work done, and of great services rendered to the country, will be the unfailing consequence of any such measure as Parliament will adopt for the purpose of dealing with the municipal institutions of London." An eminent representative of the Comtist philosophy some time since published a profound and touching Essay on a Future Life. Repudiating the imputation that his school rejected the hopeful creed of immortality, he explained that there would be a future life, inasmuch as others would live when the present generation has finally ceased to exist. The prospective greatness of a London municipality will be equally consolatory to the City magnates. They will no longer wear gowns and chains, or entertain princes and potentates; but other Aldermen from Marylebone or Chelsea will succeed to dignities with the same titles and with entirely different functions. To use a more familiar comparison, the City will be to the incorporated metropolis as a great manufacturer to a Limited Liability Company into which his firm has been converted, and in which he holds five per cent. of the stock.

One step towards the accomplishment of a task which will probably sooner or later be completed has now been taken in the formal notice which has been served on the Corporation with a felicitous avoidance of offence. All former schemes for the disestablishment of the City have failed; but, if Mr. GLADSTONE retains power for a few years, the Corporation will go the way of the Irish Church and the Irish landlords. No former Minister has undertaken with equal skill or vigour the task of abolishing existing institutions. A London municipality would probably have been created by this time if the change had been strongly desired by those who are without, or if it had not been earnestly resisted by the privileged inhabitants of the City. Even Mr. GLADSTONE's eloquence will not reconcile the Corporation to its own disappearance; but it may perhaps persuade the metropolitan ratepayers that they are aggrieved by their exclusion from the festivals and ceremonies of the Guildhall. No attention will be paid to a few disinterested critics who may suggest that the City Corporation, with its splendour and its absence of political power, is one of the happiest among many English accidents which have their origin in historical causes, and not in deliberate contrivance. The Lord Mayor represents not only the metropolis but, for certain purposes, the nation. His successor will perhaps represent London, but he will be the nominee and the organ of a political party. Mr. GLADSTONE was not afraid to assert, and was able for the moment to believe, that the municipal institutions of provincial towns "are completely separated from the exigencies of the politics of party." A year or two ago he sanctioned by his presence and approval the abominable penal laws by which at Birmingham at least one-half of the most wealthy and respectable inhabitants are permanently excluded from all share of municipal authority, and from any voice in the administration of the rates to which they largely contribute. There, and in some other large towns, the municipal institutions are wholly subordinate to the exigencies of the politics of party. In the probable contingency of the application of the Birmingham tyranny to a London municipality, a grievous and intolerable wrong would be inflicted on a minority more numerous than the population of Manchester, Liverpool, or Glasgow.

The reasons for extending to London the provisions of the Municipal Act of 1835 all lie on the surface. When, a few years ago, the conduct of a Bill for the purpose was entrusted to Lord ELCHO, a seeming unanimity in its favour was represented by the eager approval of the whole London press, with one exception; yet before the Bill could be introduced into Parliament, it was found that it provoked strong opposition, and that it had no genuine support. On reflection, the ratepayers discovered that they lived in a town which is at the same time the largest and one of the best governed in the world. The Vestries were scarcely more willing than the City Corporation to promote their own suppression. In the first draft of the Bill the management of the police was transferred to the new Corporation; and even bold politicians were alarmed by the proposed establishment at the seat of Government of a rival authority disposing of the services of twelve thousand disciplined men. For these and other sufficient reasons the Bill was withdrawn before it could be presented to Parliament, and the journalists who had hastily welcomed its appearance indulged in no lamentation for

its premature decesso. Several experiments have since been made in the same direction with like result. The government by a single municipal machinery of four millions of men possessing incalculable wealth is an experiment which has never been tried. The nearest approximation to the proposed Corporation is the Municipality of Paris, which is regarded by all prudent and peaceable Frenchmen as a standing danger to the State. From the Parisian governing body not only all Royalists and Bonapartists, but all moderate Republicans, are excluded, although theorists may perhaps have anticipated that it would be completely separated "from the exigencies of the politics of party." In the first instance, a Corporation representing the whole of London would perhaps follow the wholesome precedent which has in modern times been furnished by the City; but there is no sufficient security against the future occupation of corporate posts by political demagogues.

The strong objections to a measure which is undoubtedly recommended by plausible arguments are peculiar to London. Mr. GLADSTONE in his City speech did justice to the results which have, on the whole, followed from the Municipal Reform Act. Of late years political influences have encroached more and more on the province of local government, with the result of diminishing the regard of the electors to personal qualifications, and of promoting pecuniary corruption. In many instances the same bribes have been given with reference both to Parliamentary and to municipal elections. It is nevertheless true that the Corporations have in many cases made great local improvements, which may be largely attributed to the intelligence and zeal of the professional staffs. Town clerks, engineers, surveyors, and sanitary officers are among the ablest and most public-spirited of functionaries. The governing bodies are of course entitled to the credit of selecting advisers who, even if they are chosen for political reasons, almost always devote their energies to the discharge of their proper duties. Similar official persons would be found in abundance in London, and they would probably be actuated by the same laudable spirit; but some of them would find that their administrative functions extended over an area inconveniently large. The model of the Municipal Act would be most closely followed by the creation of several Corporations, coinciding perhaps with the limits of the Parliamentary boroughs; but even in the subdivisions of London it would be difficult to create a feeling of local or municipal patriotism. The Tower Hamlets, Southwark, and Lambeth have no staple trade, and few recognized common interests, such as those which to a certain extent unite the different parts of Manchester or of Leeds. One advantage of the institution of several municipalities would be that the City might perhaps still retain its separate existence, with a titular precedence and dignity. It appears that Mr. GLADSTONE contemplates a simpler and more sweeping change. When he proposes in the House of Commons the establishment of a Metropolitan Corporation he may justly boast that the scheme was received with applause by its destined victims, assembled to do him honour in their own ancient hall.

#### THE LEIPSI STATE TRIAL.

THE trial at Leipzig of a small band of revolutionary Socialists throws some light on the dangers with which such persons can threaten society and civilization in Germany, and also some light on the bitter hostility with which the guardians of society and civilization are regarded by those who are arrayed against them. The prisoners were in all fifteen, and were accused of high treason, their trial accordingly taking place before the Supreme Tribunal of the Empire. What they had done was to circulate secretly revolutionary publications, especially those of the famous Most, whose indiscretions have placed him within the grasp of the English law. An address to "Our brethren in the barracks" incited the soldiers, to whom it was to be surreptitiously conveyed, to disobey and, if necessary, kill their officers; and a pamphlet, even more audacious, stigmatized Prince BISMARCK as the greatest monster the world had seen. In Germany Prince BISMARCK really is an uncrowned king, and it is a legal offence of a very deep colour to speak or write of him irreverently. The publications to be disseminated were no doubt really mischievous; but it would seem that to the conspirators the great attraction of

their calling was not the hope of converting a fallen world to the orthodoxy of anarchy, but the fun of outwitting the police and getting forbidden writings into places which it was especially irritating to the police that the conspirators could reach. The indictment stated, as an awful illustration of their audacity, that one of the barracks in which they tried to address their military brethren was under the very shadow of the Emperor's Berlin Palace. It was because it was under this august shadow that the attempt had a special fascination for its authors. It was further set out that when, in October of last year, the EMPEROR went to Frankfurt to open a new Opera House, the conspirators managed to fix a few copies of one of their favourite pamphlets on a triumphal arch under which the EMPEROR was to pass. The diffusion of Socialist doctrines could not have been very effectually promoted by hiding a few copies of a pamphlet amidst evergreens and flags; but it gave these childish traitors a keen satisfaction to think that a compendium of their faith would be suspended for an instant over the sacred head of Majesty itself. The police had, however, by this time learnt enough of what was going on to make some arrests and threaten more, and then the conspirators met in solemn conclave and decided that a great blow must be struck, and it was ordered that the chief of the police should be saturated with vitriol. This somewhat feminine form of vengeance is in harmony with the fact that one of the leading conspirators was a seamstress. This charming person acted, it is said, as an intermediary between the different members of the association, and she evidently added intellectual to personal attractions; for she wrote or affected poetry, and a poem was found in her lodgings written in honour of the glorious uses of dynamite. A search in the habitations of other conspirators revealed the possession of no less than four bottles of poison labelled for the extermination of vermin, and the police had no difficulty in leaping to the conclusion that they were the vermin to be exterminated. One of the conspirators had even formed a vague project of blowing up the building in which the German Parliament assembles, and as he was a shorthand writer and sat in the reporters' gallery, he was supposed to have exceptional facilities for carrying his plan into execution. It did not appear that any of the conspirators had taken any active steps towards carrying out the projects of the band. Lots had been drawn to decide who should saturate the chief of the police with vitriol, but there apparently the matter rested. The bottles for exterminating vermin had lost none of their contents. The reporter had made no definite preparation for thinning the ranks of the press by blowing up the gallery in which he sat. What the conspirators had done was to circulate mischievous pamphlets on the tops of arches and elsewhere, to assure each other that they were wild and desperate persons ready for anything, and to implore their friends abroad to continue to send money to keep things going. Money, in fact, was indispensable under every contingency, and was as much a necessity after arrest as before. One of the leaders explained that he had to divert a sum sent by a lady for general revolutionary purposes, and apply it towards supplementing the very meagre fare which, as he found, was all that a German prison had to offer him.

The greater part of the history of this little band was only revealed to the police after the band was arrested. The arrest was prompted by a judicious guess that the prisoners must have been doing something very bad, and then evidence was obtained to show what it was that had been done. The mode by which the secrets of the prisoners were penetrated was one habitually used by the Continental police. The different members of the band were confined in cells, which they each shared with an ordinary prisoner who had committed some such crime as forgery or embezzlement, and had nothing to do with political conspiracies. The ordinary prisoner was bribed with offers of relaxation of prison discipline or mitigation of punishment to worm out the secrets of the political prisoner. He was to hint in a mysterious way that he knew where dynamite was to be obtained, or where a secret printing-press might be set up. He was, in short, to inspire a lively regret in the political prisoner that he had not earlier known one so well suited to be the friend of his bosom. Sympathy, it was expected, would lead to confidence, and the event justified the expectation. The political prisoners told enough

in their hours of expansion to seal their fate. There is nothing in this mode of obtaining evidence which is in the least repugnant to those who are charged in Germany with the administration of justice. It is a stratagem to which recourse is habitually had in France in any case, political or ordinary, where evidence is wanted, and can be obtained most easily in this way. The notion that it is unfair to the accused would never enter the mind of the most scrupulous French or German official. There is only one claim to fairness on the part of the accused which such officials religiously respect. They will never fasten any crime on a man which they do not honestly believe he has committed. It would, perhaps, be too much to affirm that in times of excitement some French or German prosecutors do not leap lightly to the conclusion that political crimes have been committed by those who are accused of them; but in the ordinary administration of justice those charged with the prosecution are rigidly honest and believe in the guilt of those whom they prosecute. In order to convict a guilty man one way is, they think, as good as another. It is just as natural and as innocent to set a spy on him in his cell as to burst open the drawers in the room he lived in and take away his papers. The only thing to ask is whether his guilt is established by the means employed. For this purpose confessions obtained by treachery are very valuable. Every one who attended the trial at Loispic, and every one who reads its proceedings, was, or may be, convinced that the account of this conspiracy was a true account. There was no attempt made to carry the narrative further than it was carried by such evidence as the public could obtain. The conspirators said that they had formed mad and wicked plans, but had done nothing to carry them out; and the police left these confessions as they stood and presented a case where punishment was deserved, but which seemed of a kind rather too humble to be brought before so majestic a Court as the Supreme Tribunal of the Empire.

But, although the methods used to obtain evidence in this and similar cases create no uneasiness in the breasts of those charged with the execution of the law, and bring home to the mind of the public that the story of the alleged crimes is a true one, they have an effect on the classes with which the police is at war, which must not be overlooked. The thought that treachery has been used to ruin their friends makes those who are still at liberty to carry on the contest doubly indignant and bitter. There seems to be something noble and virtuous in fighting the police and the society which feeds and pays the police, when the police has recourse to black arts and treacherous intrigues. The general notion that something must be done to give a new colouring to society passes into the notion that society has declared war against its would-be reformers, and is carrying on the war in an unhandsome way, and there springs up a hatred of the law, and of those who put the law in execution, which does not exist where society carries on the fight in a more scrupulous, if less effectual, manner. But if this deduction is to be made from the expediency of obtaining evidence by treachery, there is no deduction to be made from the value of the revelation itself. A more instructive story than this of the little band tried at Leipsic could hardly be imagined. It is because the conspirators were so childish and purposeless that their history is a typical one. The bulk of the new enemies of society are very much like these puerile German conspirators. They feed on foolish talk, they catch at the fringes of mad theories, they write hymns in honour of dynamite, and plot in the lodgings of a sympathetic seamstress. The finest thing they can dream of is to baffle the police by sticking copies of a pamphlet in the middle of a triumphal arch, or to plan a piece of wanton mischief like burning a steamer in a friendly port. Then the time comes when they feel that they must do something more serious. They are frightened, and want to have accomplished something great before their career comes to an end. The police is on their track, and so the chief of the police must be saturated with vitriol. Or they find the funds sent by admirers or instigators falling short, and perceive that, if more money is to come, they must do something to earn it. There must be an explosion somewhere, or the love of dynamite will grow cool. However we may account for it, there seems to be a total absence of all notion of right and wrong among large classes of persons who have received some kind of education, and the consideration that they will inflict unmerited suffering on persons who have never done them

any kind of harm never gives them a moment's hesitation. Nor are they arrested in their wickedness and folly by the reflection that the crime they propose to commit can serve no possible purpose. The police of Germany would not have been in the least weakened by its chief being saturated with vitriol. All that would have happened would have been that one policeman would have had intense suffering or have died, and one conspirator would have done a very wicked deed instead of talking of it. Fortunately, as in the German case, these projects do not generally go beyond talk. But there is no saying when very vain, weak, unprincipled and needy people may not really do what they are always talking and thinking of doing. Persons as puerile as the members of this German band are really dangerous; and, although it is rather humiliating to society that it must keep on its guard against them, it would be a great mistake to despise them, or to ignore that there is abroad in these days a spirit which easily passes from acts of mischief to acts of atrocity.

#### MR. GOSCHEN AT RIPON.

AS Mr. GOSCHEN was attending a purely non-political meeting when he spoke at Ripon, he could only touch on points which awake no party difference. He described himself as suffering under a painful privation of enjoyment in being excluded from the subjects of party strife. The horns of the huntsmen were ringing in his ears all round him, but the chase was not for him. He was obliged to confine himself to the tame and pale amusement of speaking on those things as to which all agree. First of all, there was the House of Commons, the machinery of which needs, in Mr. GOSCHEN's opinion, some recasting. It must be made more effective, both as a debating and as a legislative body. But Mr. GOSCHEN gave a word of warning to those who think that some very strong measures of reform are necessary, and that the procedure of the House must be something very different from what it is now. Those who think and hope that this can be done quickly and easily are, as Mr. GOSCHEN said, doomed to disappointment. It is precisely because the difficulties of making any radical change in the procedure of the House of Commons spring from its general constitution and its permanent relations to the country at large, as well as to the constituencies, that the subject of changing its procedure can be said to be outside the region of party politics. If all parties are interested in making the House of Commons more effective, they are also all interested in guarding the independence of the House, and seeing that it freely exercises the very various functions which custom has gradually assigned to it. The most burning of all party subjects has suddenly passed into being a subject on which all parties are agreed, and Ireland only supplies ground for an appeal to every Englishman to aid the Government in crushing tyranny and upholding the law. On the vexed question of Fair-trade and Free-trade Mr. GOSCHEN kept clear of anything that could betray a party leaning by confining himself to a record of his own studies. He has been reading up everything, bad and good, which he thought could throw any light on the points in dispute. This was not a merely playful revelation of personal history. It was a fruitful hint as to the true method of approaching many questions which lie just within or just without the range of what has become definitely associated with one party or the other. With regard to questions of this kind, the one thing needed is to get at the facts. This is generally very tedious and repulsive work. But there is no other way of forming an opinion which will bear the test of discussion. As regards, for example, the numerous suggestions which are now being put forward with indiscreet eagerness by farmers or their friends, there is at the command of any one who will go through the laborious task of mastering it, a mass of most instructive evidence which the RICHMOND Commission has got together and published. The Commission has not as yet finished its task, but when it has done all that it was meant to do and has embodied its conclusions in a final report, it will have given Englishmen a body of information by which the assertions of partisans can be satisfactorily tested, and the suggestions of amateur legislators be reduced to their proper level.

At all these subjects, however, Mr. GOSCHEN glanced in a light and easy way. He kept his serious powers for the

one topic on which he felt strongly and had really something to say. It was on Egypt that he wished to deliver his opinion at the present crisis, and as the present Government is, with regard to Egypt, in complete harmony with its predecessor, he could say as much about Egypt at Ripon as he could have said at a meeting of political friends. No one is better entitled to speak of Egypt than Mr. GOSCHEN. He knows Egypt, he has seen an Egyptian Government at work, he is alive to the weaknesses of Egyptian administration, and has had ample experience of the difficulties which must inevitably beset the working of a system like that of a joint protectorate. Further, Mr. GOSCHEN knows Turkey well; he knows the feelings, the hopes and the fears of the Porte, what it will dare to do and what it will not dare to do, what are the real means of influencing it, and who are most likely to have influence to use. That England must retain a permanent ascendancy in Egypt is now a settled maxim of every one of every party. Mr. GOSCHEN sets himself to ask what is the peculiar mode in which England ought to secure this ascendancy. Other nations thought they could make themselves prominent in Egypt by using dictatorial language, or by subterranean intrigues, or by some of the more adroit forms of corruption. England must work in a different way, by choosing as her representatives in Egypt men high-minded, disinterested, and fearless. The name of one such man whom England actually possesses as a representative in Egypt was easily given. Mr. COLVIN, in the critical moment of the recent mutiny, showed a readiness of resource, a boldness, and an indomitable spirit which may make every Englishman proud of him. He induced the KHEDIVÉ to come forward with a mere handful of attendants in presence of the troops, and front them as their master. Then, if the KHEDIVÉ had listened to Mr. COLVIN's advice, he would have at once demanded the sword of the ringleader and arrested him. Had this been done the mutiny would in all probability have been over then and there. But Mr. COLVIN could not all at once infuse the spirit of an Englishman into an Egyptian Prince, and the KHEDIVÉ, instead of arresting the leader, began to parley with him, and the mutineers were masters of the situation. There can be no doubt that the qualities displayed by Mr. COLVIN are, as Mr. GOSCHEN says, the very qualities best calculated to impress every one in Egypt with a consciousness of the moral forces which give England an ascendancy in semi-civilized States. Fortunately, too, India is a prolific parent of men of this high stamp, and the Indian Administration can supply England in Egypt with an abundant flow of representatives high-minded, bold, disinterested, and having long and varied experience in the art of governing Orientals.

Mr. GOSCHEN dwelt on the absolute necessity of our retaining the command of our main route to India, but he had far too intimate an acquaintance with Egypt, and with the varied and conflicting interests which have gathered round Egypt, to use language too commonly adopted, and speak as if there was one simple, easy, strong thing which England ought suddenly to do to her own great glory, the confusion of her enemies, and the astonishment of the world. Lord GRANVILLE works in a much humbler way, but not without satisfactory results. It was so arranged that the Turkish Commissioners should be treated with every possible civility, but should never be allowed to make anything like an examination into the state of the administration. Their departure was hurried, perhaps, by the arrival of a French ironclad, and the announcement that an English ironclad was coming. These vessels were stated to be sent in order to protect the subjects of the two Powers which, it was alleged, would be in danger so long as the native party could be stirred into a malignant activity by the presence or the arts of the Commissioners. This amounted to a very broad hint that the Powers had reason to believe that the recent disturbances owed part, at least, of their origin to the intrigues of Constantinople. The SULTAN protested that the Commissioners were the most harmless of men, and had done no more than try to make the return to order more swift and sure. This is probably a true description of what had happened, but not a true description of what was meant to happen. There can be doubt that the object of the Porte during the late crisis has been to bring forward a native party, and make it lean on Turkey and against England and France. The end has been that the native party clearly

sees that it cannot lean on Turkey, and must work within such limits as the control of the two Powers impose. A Council of Notables is to be assembled before long, and has often been assembled in times past. There cannot be much for the members to do, even if they were capable of performing it; but they may possibly disclose some grievances and suggest some remedies. A matter of far greater importance is the announcement that steps are to be taken at once to set up a new system of justice for the natives. This is, of all reforms, that of which Egypt stands in the greatest need. It has been talked of for years, and a project for giving good tribunals to the Egyptians themselves was a part of the general scheme of NUSSE PASHA, of which the institution of the International Tribunals was the other half. As was natural, England has strongly supported the new Minister in his resolve to signalize his accession to office by a salutary and popular reform. To keep the Egyptian Government doing what is best for the people may be said to be the policy of England, and the secret of carrying out this policy lies, as Mr. GOSCHEN says, in the choice of representatives of England having the qualities on which it gave him a patriotic pride to dwell.

#### AFGHANISTAN.

THE recent news from Afghanistan, although not as yet fully confirmed or explained, will doubtless rejoice the hearts of the moral-barrier theorists in England. The Afghans have proceeded, by their usual process of cutting one another's throats, several steps farther in the direction of that internal peace among themselves and external affection towards England which Mr. GLADSTONE believes to be their natural condition when undisturbed by the machinations of English Tories. On the other hand, the abandonment of almost the last, if not the last, section of the scientific barrier has been decided upon, and the Russian advance on Herat is to be answered by an English retirement on Quetta. That all-important post is not, indeed, to be evacuated, at least as yet, and it will be occupied during the winter by a brigade of considerable strength. The enthusiasts for moral barriers, and nothing but moral barriers, are, however, to be gratified by a reduction of the garrison in March, and meanwhile they may comfort themselves with the recollection of the difficulties which General PHAYRE experienced last year in endeavouring to move from Quetta on Candahar. That it should be as easy as possible for Russia to reach and control Afghanistan, and as difficult as possible for England to do so, is the ideal of this class of politicians as regards the North-West frontier of India. Mr. GLADSTONE, who apparently shares at once their opinions and their knowledge of the facts, has not been able fully to gratify them as yet. But he has done his best and deserves their gratitude. Their efforts will doubtless be now directed to the abandonment of Quetta; but as on their principles this would be the necessary corollary only of a still further advance of Russian troops, it is possible that they may await the occupation of Meshed or the final conciliation of the Turkomans before making an urgent demand for that measure.

The affairs of the AMEER since his victory near Candahar appear to have been conducted with much good luck, and even with some considerable amount of skill, the generals whom he had sent to foster insurrection against his rival in the west having been seemingly much more efficient, or else very much more fortunate, than the incapable and unlucky commander who lost him Candahar, and who went near to losing him his throne. Guerilla warfare had been going on against AYUB's governors for some time in the district of Taiwarra, between Cabul and Herat, and the AMEER's emissary, ABDUL KUDUS, joined himself to the insurgents. AYUB's troops, though led by the able LUINAB, whom he had left behind at Herat, appear to have been unable to resist this combination. A curious incident of this war, aptly illustrating Lord SALISBURY's parallel between Scotland in old days and Afghanistan to-day, is the reported destruction by AUBA KHAN, the guerilla chief, of his own capital, if it may be so called, of Taiwarra, as useless to himself and liable to prove a harbourage for his enemies. The news of these reverses must have met AYUB as he fled northwards from Farrah, and though it cannot be said to be certainly known whether he has entered Persia—Sir

It is well known how difficult it is for a Government, though it is easy for a newspaper or a private person, to communicate with Meshed, where Afghan matters are always known at once—it would be his natural, and indeed almost his only possible, course. Little attention need be paid to the rumours of intestine disturbances in Eastern Afghanistan. Such disturbances always exist in one part or another of the actual country, though no doubt not in the Afghanistan of Mr. GLADSTONE's imagination. The Saturnian reign of SHERE ALI, on which he looks back as a golden age, disturbed by an irruption of English barbarism, was one continual series of such things, which are indeed the natural occupations of the Afghan. An Ameer of Afghanistan, like his prototypes the Kings of Scotland before the seventeenth century, can only hope that by adroit management he may prevent or overcome combinations of the jarring clans against himself, not that such combinations will give place to an orderly and civilized "King's peace." In his present position ABDUL RAHMAN has a very fair chance of attaining and keeping this state of unstable equilibrium, and that is all that can be said for him. There is no immediate reason for apprehending any inconvenience from him, for he has at the present moment everything to lose and nothing to gain by being a bad neighbour to India. The actual destination and fate of AYUB are matters of more immediate interest. The Persian Court, despite, or perhaps in consequence of, its hankering after Herat, is not very likely to regard him as a welcome guest. Indeed it was said, with what amount of truth it is not easy to judge, that after Sir FREDERICK ROBERTS's victory orders were given at Teheran not to admit him on Persian territory. There is, however, another refuge which is always open to unlucky Afghan princes, and where, if he can reach it, he is certain of the position accorded to pretenders who have no objection to make themselves generally useful.

There is, therefore, very little doubt that, in default of some new revolution, which in such a state of things as has just been described is always possible, a short time ought to put Herat in possession of the AMIR, who is not likely to have to use his siege train against its famous earthworks, the alleged amount of the garrison being utterly insufficient to hold so large a place. Yet another short time should also put him as much in control of the whole country as he is ever likely to be. Afghanistan itself might then be left to the enjoyment of the Arcadian felicity which Mr. GLADSTONE imagines to be its natural portion, and to the observation of Brigadier-General EDWARDS and his seven regiments at Quetta. It is, however, on this side of Afghanistan that the interest of Central Asian politics lies at present. Lord SALISBURY has, as was to be expected, been reviled for saying that Russian troops are not very much further than a day's march from Meshed, and within striking distance of Herat. The latter statement is absolutely true, for the road is perfectly open, and there is not a force of any kind which could or would interpose an obstacle. The former is itself little more than a rhetorical exaggeration of the actual fact, and is not an exaggeration at all if the recent claims for extension of the Russian frontier are taken into consideration. It is possible that the Russian authorities entertain the same view of the Afghan nation and of the superiority of moral to physical barriers as that which Mr. GLADSTONE holds; but, if so, their conviction leads them to a different, and perhaps a more logical, line of conduct. The Russians are anxious for a nearer and more intimate acquaintance with these kindly and affectionate mountaineers, and they hurry to establish it and to knit for themselves the bonds of which Mr. GLADSTONE talks. They are so convinced of the impolicy and inefficiency of physical barriers that they wish to obliterate them altogether. We, on the other hand, regard the Afghan as a person to be kept at a distance, if possible, by a physical barrier of mountains and deserts. The Russian St. Petersburg-Herat railway is hurried on at a rate which would not disgrace the United States. The English Bombay-Quetta railway is abandoned. We evacuate Pishin, which many even of those who were adverse to the retention of Candahar regarded as an indispensable boulevard of India; the Russians strain every nerve to bring their frontiers to march with those, not merely of Afghan Turkestan, but of Afghanistan itself. The difference is a remarkable example of the opposite lines of conduct to which identical convictions sometimes lead. Yet perhaps it would be unwise to forget that

Russia has a motive which England—even Mr. GLADSTONE's England—certainly has not. Whatever the supporters of the Government in this country may think—or, rather, whatever they may say—all Asia thinks that the Russians were "hunted out of Afghanistan" by the late Ministry. And the Russians themselves know it. They are not accustomed to leave debts of this kind unpaid, still less to leave their Asiatic subjects and neighbours under such conceptions of their state of indebtedness. Their preparations for settling day are certainly more in accordance with prudence, to say the least of it, than Mr. GLADSTONE's. They are putting themselves in a position to pour men and material, by an unbroken line of rail and steamboat communication, direct from the camps and arsenals of Russia to the frontiers of Afghanistan. We are making the corresponding process as difficult for ourselves as possible, in reliance on the gratitude of ABDUL RAHMAN, the kindly affections of the Afghans—whom Mr. GLADSTONE himself thinks we have treated shamefully—and the impregnable "feather bed" "twist castle wall, and heavy brunt of cannon ball" furnished by a Moral Barrier.

#### AMERICA.

IT seems to be little doubt that the President of the UNITED STATES will make considerable changes in the Cabinet appointed by his predecessor. In selecting his own advisers he will act in conformity with the precedents established by other Vice-Presidents who have succeeded to the higher office. An American Cabinet is not united to the chief of the Republic by ties as close as those which connect an English Prime Minister with his colleagues. On the other hand, he is not compelled, like an English Sovereign, to accept advisers imposed upon him by the Legislature. In the first instance, the nomination of a Minister may be rejected by the Senate to which the appointment is submitted; but when the Cabinet has once been formed, its tenure of office is for the rest of the Presidential term entirely independent of the pleasure of Congress. At a time when the prerogative of the President had, through the operation of temporary causes, been reduced to the lowest point, the Senate summarily refused to confirm General GRANT's first nominations. The new President enjoyed in consequence of his military services unbounded popularity, and he had been a few months before elected by an overwhelming majority; but the list of his chosen Ministers showed that they had been selected for their qualifications without reference to their claims on the dominant party. The Republican managers consequently caused the Senate to withhold its confirmation, and the proof of their controlling power was so conclusive that during the next eight years General GRANT not only abstained from any attempt to reassert his independence, but allied himself closely with the usurpers or rival claimants of his right of patronage. Mr. ARTHUR has no reason to fear any similar interference with his discretion. Late events have inclined public opinion to the side of any President who asserts the rights corresponding to his responsibility. The Republican party no longer exercises the supremacy in the Senate which enabled it to impeach Mr. ANDREW JOHNSON and to check General GRANT. While parties are almost equally divided, any section of the Republican party may at any time be overruled by the united Democrats.

In the United States, as in other free countries, there are conventional understandings which are almost equivalent to unwritten laws. No prudent foreigner will speak confidently of the complicated claims which a President must consider in the formation of his Cabinet. Defeated nominees for the Presidency, sometimes more considerable personages than the successful candidate, have sometimes been held to possess a claim to the highest office in the Cabinet. On this ground Mr. SEWARD, the acknowledged leader of the Republican party, became Secretary of State under his obscure competitor Mr. LINCOLN. It is not known to this day whether the Minister or the President was chiefly responsible for the important political decisions which were made during the Civil War. Mr. SEWARD served his official superior loyally, but he may perhaps have been secretly disappointed at the hold which Mr. LINCOLN's original and homely character acquired on the confidence of the

country. At an earlier time Mr. WEBSTER had, on similar grounds, held a post in the Cabinet of Mr. TYLER. Mr. GARFIELD conformed to the established practice in the appointment of Mr. BLAINE as Secretary of State. Of the defeated candidates at Chicago Mr. BLAINE had received the largest amount of support with the exception of General GRANT, who would have been for many reasons ineligible. His opinions seem to be indistinguishable from those of Mr. CONKLING; but Mr. BLAINE belonged to the same section of the party with Mr. GARFIELD. It was understood to be at his instance that the PRESIDENT performed the most questionable act of his short term of office, in the appointment of Mr. ROBERTSON for party reasons to an important and lucrative post. Mr. CONKLING resented the selection, not because he favoured Civil Service reform, but as being in his opinion the legitimate disposer of patronage within the State of New York. The other members of the Cabinet enjoy only local reputation; and they may probably have been selected for their administrative qualities. The claims of certain States to representation in the Cabinet are fully understood only by experienced American politicians. Mr. HAYES, who seemed to foreigners to be a highly respectable President, appears to have incurred discredit by his preference of claimants from his own State of Ohio, of whom some were his personal friends. Mr. GARFIELD also was a citizen of Ohio, and his conduct would have been severely criticized if he had shared the predilections of his predecessor.

As Mr. ARTHUR has been a close ally of Mr. CONKLING, it has hitherto been assumed that Mr. BLAINE will retire from the Cabinet. The Attorney-General, Mr. MACVEAGH, and the Postmaster-General, Mr. JAMES, have already tendered their resignations, with an intimation that the offer is not to be understood as merely formal. Mr. WINDOM, Secretary of the Treasury, is also expected to retire; and, although he has continued the reduction of the debt, he is said to have caused some loss to the Treasury by an error in his mode of operation. If he retires from office it might at first sight be thought probable that Mr. SHERMAN would be invited to resume his former post. No other leader of the Republican party enjoys so high a reputation as a financier; but it is understood that on other grounds his appointment would be distasteful to the PRESIDENT. For reasons known only to American politicians, the antagonism in the Convention between Mr. SHERMAN and General GRANT was more bitter than that of either candidate with Mr. BLAINE. Mr. ARTHUR, as an active supporter of General GRANT, has not been reconciled to Mr. SHERMAN, who was represented by Mr. GARFIELD. The recent defeat of the so-called "Stalwarts" in the New York Republican Convention will not have increased Mr. CONKLING's chances of appointment to the office of Secretary of State. It might also perhaps be disagreeable to the PRESIDENT that the chief post in the Cabinet should be filled by one of his two reputed patrons. There are stronger reasons against the employment of General GRANT, who was believed to share Mr. CONKLING's influence over Mr. ARTHUR. The relations among the allies are wholly changed by the elevation of the least conspicuous of the three to the highest post in the Republic. The PRESIDENT may be expected to assert his independence, and there is reason to believe that he contemplates a novel and skilful combination. If he could induce Mr. CONKLING and Mr. BLAINE to abandon their personal feud, and to enter the Cabinet together, the most considerable schism in the Republican party would be healed, and the pretensions of General GRANT might perhaps be safely disregarded. If the scheme fails, it is barely possible that General GRANT might become Secretary of State; yet it may be doubted whether the Senate, even in its present compliant humour, would approve so strange a nomination. To foreign Governments there is no reason why such an appointment should be unwelcome. General GRANT is believed to entertain friendly feelings to the Powers with which the Secretary of State has principally to deal, and he must have a wide knowledge of international relations.

The assurance given by the PRESIDENT in his inaugural address that he would continue the policy of Mr. GARFIELD would not be too strictly construed if any change were deemed desirable. It was natural that Mr. ARTHUR should defer to the popular sentiment of the time, which he probably shared. At that moment any deviation from the principles and practice of the murdered President would have shocked public feeling. The best security for the

fulfilment of Mr. ARTHUR's promise is the difficulty of devising an alternative course. Like Mr. GARFIELD, the actual PRESIDENT is a Republican, and he is pledged, in common with the rest of the party, to a policy which has really no opponents. The Republicans have tacitly dropped their claim of interference in the affairs of the Southern States; they now maintain sound doctrines on the subject of the currency; and they are vaguely pledged to some indefinite scheme of Civil Service reform. No great revolution in the system of appointment to minor offices will be effected so long as Mr. BLAINE, Mr. CAMERON, and Mr. CONKLING direct the councils of the party. Mr. ARTHUR had been suspected of heretical tendencies on the tariff; but he has now given his adhesion to the prevailing doctrine of Protection. He may perhaps be well advised in waiving for the time opinions to which he could not, in opposition to a great majority, have given effect.

A short time since it seemed in the highest degree improbable that the Government of the United States would have to deal with any foreign complications. The violent language and conduct of the Irish population would cause little uneasiness but for the strange complicity of the press with lawless attacks upon England. It is said that native-born Americans are at present amicably disposed to a country which has long courted their good will, and this impression will be deepened by the PRESIDENT's graceful act at the Yorktown Centenary. Nevertheless, almost all American newspapers profess to desire the independence of Ireland. The crimes and the treasonable designs of the Land League would have been long since sternly repressed if they had occurred in the United States. The disruption of the United Kingdom would be a far more ruinous disaster than the permanent secession of the Southern States, yet the determination of England to prevent separation by force meets with no American sympathies. The PRESIDENT and his Government are not responsible for popular feeling or language; but it may not improbably become their duty to repress criminal attempts such as the recent attempt to burn one of the Cunard packets. Mr. GOLDWIN SMITH truly said that the use of dynamite is utterly repugnant to a high moral civilization. It may be hoped that repugnance will take the form of active precautions against one of the vilest modes of murder.

#### THE ENGLISH LAND BILL.

THE reception which the draft Bill of the Farmers' Alliance—first discussed, though not first promulgated, at a meeting of that body on Tuesday—has met with from the political party from which it has most to hope has not been encouraging. The Radical newspapers have, as in duty bound, abstained from throwing actual cold water on the project, but they have not received it with anything like enthusiasm. Perhaps this is in part due to the remarkable frankness of Mr. JAMES HOWARD and his friends on some points very dear to Radical theorists about what are called the Land Laws. For years such theorists have been vociferating that primogeniture, entails, settlements, life-ownership, and such-like things were stifling and strangling British agriculture. Deprive a landlord of the power of providing for the support of his house and name, put a penalty even on the omission to make a will, and the whole country would blossom like a rose, there would be no more bad seasons, the English farmer might laugh at American competition, and all would go well. These persons now find themselves completely thrown overboard by the very body which they hoped, and still hope, to use as a lever for the destruction of the "landed gentry" system. "Whatever," said Mr. JAMES HOWARD, with the most brutal candour, "the importance of the transfer of land, the laws of inheritance, and so forth in other respects" might be, it was their business to deal with those subjects which more directly and materially affect the "interests of tenant-farmers." Speakers and writers who have been contending for years that nothing can possibly affect these interests more directly and materially than the very points thus thrown aside are naturally rather aghast at such a rejection by the persons confessedly most concerned.

The result has been that some very salutary truths have been told to the Farmers' Alliance by their own

political friends both at the meeting and in the press. Mr. D. GRANT, M.P., told his companions at the meeting bluntly that the Bill meant that the tenant was to supersede the landlord. The *Daily News* informs the Farmers' Alliance that "where the parties can take care of themselves the interference of the most competent tribunal is likely to do more harm than good," and that there is "no pretence for saying" that the English farmer has any rights other than those given by the express contract he has made. Indeed the general tone of the English supporters of the Ministry may be interpreted as carrying with it a strong suggestion that the Farmers' Alliance had better hold their tongues, vote steadily for Mr. GLADSTONE, and see what he will do for them. Nor is this at all surprising, not merely on account of the heresy just noticed, but because Radical critics of any intelligence cannot fail to see that such demands as those of the English and Scotch agricultural agitators are likely to put their political leaders in a position of very great difficulty. It is tolerably certain that English urban constituencies would be by no means eager to urge their members to vote for such a measure as that which was discussed at Tuesday's meeting. It is, as even the advocates of land reform have had to confess, a simple demand on the part of one class that a dead lift shall be given to them by legislation at the expense of another class on which they have absolutely no claim but that of definite terminable contract. To give the sense of the so-called English Land Bill in a few words, it amounts to this—that the choice of tenants shall be taken out of the hands of the landlord; that he shall be absolutely precluded from all control over the management of the land; and lastly, that all direct and indirect increment of value in consequence of the tenant's improvements—and under the circumstances there could hardly be any other—should go to the tenant and be marketable or assignable by him. The import of this last provision, which is the kernel of whole Bill, is unmistakable. The landlord has no vote on improvements in the first place, and no benefit from them in the second, even though the land to be improved is as essential an element, to say the least, in the improved value as the capital spent on it. An exemplification of this doctrine in a different, but strictly analogous, matter is easily given. A sempstress receives so much linen to make into shirts; she expends on it labour and capital, in the shape of money paid for thread, light, food, &c. The increased selling value of the made-up linen, according to the doctrine of the Farmers' Alliance, belongs, not partly—as in justice it does, and as is acknowledged by the payment of wages—but wholly to her. Her employer is entitled only to the original cost of the linen, with an allowance, at the current rate of interest, for being temporarily kept out of his money. This parallel—which is, let it be repeated, not in the least unfair—suggests a difficulty in the way of the Farmers' Alliance which has, as a matter of fact, actually made itself felt. It is evident that, on their principle, the labourer is a person to be reckoned with, and the labourers' advocates are quite shrewd enough to perceive it. Mr. HOWARD, with the same admirable, but perhaps injudicious, frankness, explained, we are told, to Mr. GEORGE MITCHELL that an association of farmers was naturally engaged in forwarding the interests of the farming class. Other classes may possibly be found to object to a process of "forwarding" so natural, but at the same time so exclusive.

It is not improbable that the agitation thus conducted, and conducted on similar but not identical lines in Scotland, may do some good. The attack on the rights of the Irish landlords was tolerated, and little more than tolerated, by the majority of English constituencies chiefly because they knew nothing and cared nothing about the matter. There are, however, very few electors in England who do not know something about the position of the English farmer. That very important personage, the town voter, may have no very ardent affection for landlords as a class, but he has at the same time no more ardent affection for farmers as a class. He regards them as persons engaged like himself in gaining a livelihood by business, and he is not likely to be particularly anxious that they should have "marketable securities," if that is the word, against loss or failure in their business which he himself does not, and in the nature of things cannot, possess. In Scotland the case is rather different, because in the odd mixture of occupations which characterises the country as compared with England, the interests of the rural and

the urban electors are more united. But even there the same argument applies in a great degree, while the notorious fact that, under the system of nineteen years' leases, the average Scotch tenant has nothing whatever to complain of makes the case against the aggressive occupiers stronger than in England. It is already obvious, moreover, that the action of the farmers both in England and Scotland, or rather, of the farming agitators (for the same names constantly recur, and the agitation cannot be fairly said to extend to more than a fraction of the agriculturists of either country), is placing a serious political stumbling-block in the way of the Liberal party—a stumbling-block which is clearly seen if its existence is not openly avowed. They have pledged themselves to enfranchise the labourers, and the labourers may probably be consulted on this very point; yet the farmers, both by their deeds and their words, make it quite clear that all they want is simply so much private advantage, and, as Mr. GRANT says, the putting of themselves in the place of the landlords. This is not a programme at all likely to conciliate the multitudes whom Mr. GLADSTONE and his friends are by their own account longing to lead to the polling-booth. The demands of the English farmer for the whole future increment of the land's value, and of the Scotch farmer for compulsory lowering of rents and fixity of tenure, are from their exclusive nature things which no Government, however rockless, could well think of granting unless the preponderance of the claimants in the electorate were overwhelming. The tenant-farming class is—to its credit be it spoken—far from unanimous in making these demands, or any demands at all resembling them. Even if it made them in a mass, it does not command anything like a majority in the House or the constituencies, and in the very constituencies where it does predominate the Government are pledged to swamp it by admitting men of another class more numerous and certain to regard the particular privileges accorded to their immediate masters with the bitterest jealousy. The situation is a highly curious one, and a remarkable illustration of the awkward effects of Mr. GLADSTONE's habit of bidding recklessly for the support of any class likely to be useful, and encouraging any agitation presenting capabilities of political leverage. Hitherto he has been able to discharge the liabilities he thus incurs by making the less numerous and more wealthy classes discharge them for him. But here, to all appearance, there may be considerable difficulty in carrying out any such operation.

#### WEST CUMBERLAND.

OF the thousands of tourists who visit the Lake district every summer, it is strange that so few penetrate to the west coast. A line drawn from Conistown to Derwentwater, or at any rate to Buttermere, forms the western boundary of the ordinary visitor, and even those energetic persons who cannot leave the district without "polishing off" Scafell, to use the favourite formula of Alpine and other climbers, go no further west than is necessary for the accomplishment of their purpose. They arrive at Wastdale Head one evening, perhaps, from Derwentwater by way of Sty Head Pass, ascend Scafell the next day, and then depart by way of Black Sail and Scarf Gap to Buttermere. Tourists' guides hurry over this portion of their task, as is natural enough, for there are no large hotels to be mentioned, and not many "sights" to form the subjects of high-flown descriptions. Yet this side of the country has one charm which is wanting to the more frequented parts of the district. The sea is an important element in the scenery; and even in the matter of mountains the west can hold its own. There is no finer view in all Cumberland than may be had from a low hill, overgrown with parsley fern, and stag's-horn moss, on the way from Wastwater to the sea. Looking inland, the nearest shores of the lake are hidden by a belt of larches and Scotch firs, beyond which the water stretches, looking black even on the brightest days from the reflection cast by the overhanging Screees. These rocks form a curious feature in the landscape. They would descend almost perpendicularly into the lake were it not for vast masses of broken stone which have been detached from the face of the rocks and have fallen into the water. The sloping banks of loose stone thus accumulated rise in some places more than half-way up the cliffs, and look like enormous buttresses supporting them. In parts where the fall of stone has almost ceased, ferns, shrubs, and even trees have taken root, though not in sufficient numbers to relieve the desolate appearance of the steep cliffs. Elsewhere the surface of the rock, which is rich in iron ore, shows warm tints of red where stone has lately fallen, and one cannot row down the lake without seeing little clouds of dust rising one below another and hearing the sharp rattle of the falling stone. On the other side the slope

is more gradual, and a winding road runs between the lake and the falls to the head of the valley, where the view is abruptly terminated by a group of high mountains. Scafell, the most easterly of these, in spite of its height, is not nearly so imposing as Great Gable, which stands in the centre, and is beyond all question the finest mountain in the Lake district. To the west of this stand Kirkfell and the Pillar, with its precipitous rock, which has been fatal to more than one reckless climber. The want of trees gives a desolate appearance to the scenery, though it increases its grandeur; and perhaps the dale looks best in autumn, when the bracken, turning red and brown, gives warmth and colour to the landscape. The view in the opposite direction affords a pleasant relief after the desolate prospect inland. The valley opens out, and the hills gradually slope down to the level ground. The fresh green of the fields and the warm yellow of the ripening corn contrasts pleasantly with the darker tints of the thick woods; while in the distance the hazy grey of the sea forms a background to the glistening sand-hills, and, far away to the west, the Isle of Man may be sometimes seen on those very clear evenings which are generally followed by rain. The river Irk, after rushing rather impetuously out of the lake, sobers down considerably in the course of the next few miles, and wanders westward, with many windings, until it arrives within a mile of the coast, where it makes an abrupt turn to the south-east, and runs parallel to the shore for a mile or so to Ravenglass, where it forms a common estuary with the Mite and the Esk. According to some old maps, it once ran into the sea at Drigg, and the sandy nature of the coast renders it very probable that the course of the stream may have been thus diverted. It is recorded, too, that pearls were once found in great numbers at the mouth of the river, and that the simple country folk who gathered them at low water sold them for trifling sums to travelling dealers, wondering perhaps, like the dwellers on the amber coasts of whom Tacitus tells us, why any one should come so far in quest of useless objects by which they themselves set so little store. In the neighbouring valley of the Esk is the Muncaster estate, where woodcock were so plentiful up to the end of last century that it was the custom for the tenants to sell them to the lord at the cheap rate of a penny each. From Ravenglass a narrow-gauge railway runs along the foot of Muncaster Fell, bending round its north-eastern end into Eskdale. It was constructed to carry iron ore from Boot to the main line, but the workings have been for some time deserted, and the tiny trains now convey only a few passengers. The method of signalling is beautifully simple. There are no officials on the line except the guard and driver, and passengers hail the train as they might an omnibus, without troubling themselves to go to the nearest station. If any one happens to be waiting at a station, the guard dismounts, opens the booking office, issues tickets, and goes on his way again. No indecent haste cuts short the pleasure of lovers of fine scenery, and the engine-driver has been known to stop to pick up a wild duck which had been shot and had fallen on the line.

The country which lies south-east of the Scafell range, where the valleys of the Esk and Duddon converge, is well described in Wordsworth's sonnets on the latter river. It is a wild, dreary waste of hill and moorland, "sullen moss and craggy mound—unfruitful solitudes," where "desolation is the patron saint." One may walk for miles without finding any trace of human habitation, except where some turf-cutter has left his spade standing in the peaty soil, or where the smoke rises from a solitary cottage. The sheep stare at an intruder with an air of confidence in their right to be where they are which is generally wanting to them. Here and there, especially after a wet season, one comes upon the skeleton of a lamb picked clean by carrion crows. Hawks hover fearlessly overhead, and flocks of curlews come sweeping past, forgetting their usual caution in the rarity of meeting with a human being. To the north of Wastwater, towards Ennerdale lake, stretches Copeland Forest, a succession of fells almost as wild and solitary as the country about Wrynose and Hard Knot, which has just been described. Towards the sea, however, there is a wide tract of lower ground, where we reach once more the regions of men and railways. In the valleys of the streams which run from Copeland Forest are several towns and villages of interest. In the little market-town of Gosforth, about four miles west of the foot of Wastwater, there are one or two quaint cottages of the seventeenth century, and a fine farmhouse, probably of the same period. The churchyard contains a cross, some twelve or fourteen feet high, in excellent preservation, which appears, from the character of the decoration, to be of Scandinavian origin, though authorities differ on this point. A few miles north-west of Gosforth lies the lovely valley of the Calder, where the ruins of the abbey still stand, though their appearance is rather marred by the too close proximity of a very ugly modern house. The abbey belonged to the great Cistercian house at Furness, and a happier choice of a site could scarcely be imagined. Cold winds are effectually shut out by the hills, thickly covered with trees, which rise on either side. The valley slopes gently to the south-west, and from the abbey one may trace the windings of the river till it reaches the sea. Still pursuing a north-westerly course we reach Egremont, one of the oldest towns in Cumberland. On a hill overlooking the town some remains still exist of the castle built by William de Meschions soon after the Conquest. This William was the brother of Ranulph de Meschions, to whom William I. granted the greater part of Cumberland and Northumberland, and he received from his brother the barony of Copeland, which seems to have included

all the land lying between the Duddon, the Derwent, and the sea—in fact, the whole Ward of Allerdale-above-Derwent. The town is not very remarkable, except for the fact that one of the largest statute fairs in Cumberland is held here; a custom which, it is to be hoped, in the interests of decency and morality, may soon fall into disuse. To the north of Egremont lies the chief mining district of West Cumberland, which was some few years ago in a very flourishing condition, and may well recover its prosperity with a revival of trade. The headland of St. Bees, with its cliffs of red sandstone, is a few miles to the west of this district. Here, as the legend runs, the Irish St. Bege landed in the seventh century, and, in gratitude for her prosperous voyage, founded the chantry named after her. It was destroyed, like so many religious houses in England, by the Danes. William de Meschions, on becoming lord of the barony of Copeland, restored the chantry on a very much larger scale, and made it over to the Benedictine monks of York. Wordsworth has told the story of the foundation and varied fortunes of the abbey in the beautiful "Stanzas Suggested in a Steamboat off St. Bees's Head." Its site is now occupied by the Theological College. The Grammar School, which has several scholarships at Queen's College, Oxford, was founded by Archbishop Grindall. The port of Whitehaven is worth a passing visit, for the sake of the picturesque view of the town from the quay. In 1566 the town consisted of only six houses, and possessed one small vessel of eight tons. For many years afterwards the growth of the place was slow; but, aided by the wealth and influence of the Lowther family, it gradually increased in importance, and is now a considerable seaport. It has, too, large coal mines, which stretch away under the sea for a long distance. Though there are no very fine buildings, the general effect of the town is pleasing enough; and the low square towers of the churches are peculiarly well suited to the character of the place and its surroundings. Unhappily, the most interesting of the churches is now suffering restoration of a kind which will entirely destroy its beauty. To the north of Whitehaven the country offers fewer features of interest. The little town of Cockermouth ought to be mentioned, for it was the birthplace of Wordsworth; but, when the Derwent has been crossed, we find ourselves in the flatter and more monotonous country which reaches to Carlisle.

The inland portion of Cumberland is interesting for the preservation of a class of farmers which now exists scarcely anywhere else in England. In the more level country towards the sea farms are in many cases large; machinery is extensively used, and "high farming" is not unknown. But in the hilly districts the yeomen, or 'statesmen, as they are commonly called, still survive, though unhappily with lessened prosperity and in constantly decreasing numbers. Barely owning more than eighty acres, and often as few as fifteen or twenty, they lead a thrifty, hard-working life, scarcely richer in comforts than the labourers whom they employ. They live mainly on the produce of their own farms. Barley bread and oatmeal cakes and porridge are their staple food, while buttermilk is the common drink of the country. Butcher's meat is only eaten on high occasions, and even home-cured ham and bacon are used sparingly, the greater part being sent to market. In dress and education the master differs little from the man, especially since farmers have for the most part ceased to manufacture for themselves the grey homespun cloth which once formed their distinctive dress. But in spite of their fallen fortunes the 'statesmen have not lost their family pride. They regard as far beneath them the prosperous tenant of several hundred rich acres in the low country, and they certainly have whatever justification long descent can give them. Many estates have remained in the same family for three or four centuries, and we know of one in Wastdale which has belonged to the ancestors of its present owners ever since the Conquest. The farmhouses, simple and even mean as they are, often contain fine old oak furniture. Exquisitely carved cupboards, coffers, and long settles of beautiful workmanship are by no means uncommon. The women of the household are generally very proud of their china, and we have seen many specimens which would fetch large prices if they were put up for sale where collectors congregate. Many beautiful pieces of silver plate, each with its history, lie locked up in the oak coffers; quaint candlesticks, forks, and spoons of rare patterns, and curiously wrought sugar-tongs, which only see the light on solemn festivals, when the choicest dinner service is set on table, and the finest linen is brought out from the press in which it has lain year after year for two or three generations. It was from the class of 'statesmen that the greater part of the clergy of Cumberland were formerly drawn, and the many odd stories which have been told of country "priests," as they are still called, appear quite probable and natural when one considers that they were for the most part men of little more education than their brothers who were still guiding the plough or following the sheep. The value of benefices in the county was, and still is as a general rule, exceedingly small, and a clergyman's simplest means of eking out his very scanty stipend was by returning to the kind of work which he had been accustomed to do in his youth. There are some amusing stories in Dickinson's *Cumbrians* turning upon an unexpected visit of the bishop, who finds the parson of the parish engaged in sheep-washing or some such rural pursuit. One poverty-stricken incumbent, bolder than his fellows, replied to the bishop's reproach that he was quite willing to leave off helping his neighbours if his lordship would find him a sufficiency to live upon without such work—a retort which briefly expresses the whole merits of the case.

Another survival from bygone days may indeed be of less historical interest, but it more nearly affects the traveller's comfort. In West Cumberland it is possible to find inns which have neither been glorified into hotels nor degraded to the rank of public-houses. The innkeeper is as often as not also a farmer, and the advantages of such an arrangement are obvious enough. The inn itself is generally a long, low stone building, covered with roughcast. The surface of the whitewashed walls is pleasantly broken by a facing of grey slate round the door and windows, while the stone horse-block, the steps leading up to the loft, and the coping of the low garden-wall are scoured with the red iron-ore in which the district abounds. The old-fashioned flowers in the trim little garden heighten the effect of colour, and from the open stable-door comes a fresh healthy smell of dried bracken, which is used for litter instead of straw. The outer walls of the house are generally very thick, for stone may often be had for the trouble of carting it; but the bedrooms are for the most part separated only by wooden planking papered over. The consequence is that the movements of one's neighbours may be heard almost as clearly as on board a mail steamer; but after a day's walking across the fells neither snores nor conversation can keep one awake. At whatever hour you may arrive, fried ham and eggs, the standing dish in Cumberland, will be served smoking hot at a quarter of an hour's notice in the smallest and most comfortable of sitting-rooms. The floor may be of stone, but it is spread with warm rugs, and one soon grows accustomed to the slight elevations and depressions in the surface. The chairs have heavy oak frames, broad rush seats, and arms which satisfy the desire for some slight support, without inducing premature slumber after dinner. A miscellaneous collection of pictures lines the walls. Coloured portraits of royal personages are as plentiful as prints of champion wrestlers. A brewer's advertisement in red and gold on one side of the chimney-piece is balanced by double-distilled whisky, in black and silver, on the other. A certificate of the host's enrolment as a member of the Independent Order of Odd Fellows is flanked by two black frames full of funeral cards, and above the fireplace hangs a sampler worked by the hostess thirty years ago.

#### QUEEN ANNE'S SON.

WHILE the fact of Queen Anne's decease is one of the best known truths of history, most people who have passed the age of examinations do not remember that she had any son at all. Yet Queen Anne, or, to be more accurate, the Princess Anne, was the mother of seventeen children, of whom only one survived to the age of eleven. This was the little Duke of Gloucester. A servant of the Duke, a Welshman, named Jenkin Lewis, wrote a little memoir of the child, which is now very rare, or, rather, not to be obtained at all. Macaulay, "who had seen almost everything which related to the reign of William III., never mentions it," though Macaulay lived for many years at Holly Lodge, near Camden House, where the little Duke of Gloucester passed most of his limited time in this world. Mr. W. J. Loftie has just reprinted Jenkin Lewis's tract, with a brief introduction. The little book has a pathetic sort of interest; the details of the young Duke's life are quaint and amusing, and, as there are but two hundred and fifty copies of the volume (published by Mr. Stanford), the fresh edition is likely soon to become as scarce as the old one. As the book cannot come into the hands of many readers, we propose to give a brief account of the adventures of "Le Très Puissant Prince," as the child was called when he received the Garter in 1695.

William, Duke of Gloucester, was born on the 24th July, 1689. He was a child of that stormy year of the Revolution, when the Princess Anne chose to follow her husband and the rising sun rather than to go with her father and the declining luminary of the House of Stuart. The baby was a very weakly child, and most people forecast his early fate. His first experiences of life took the shape of "convulsion-fits," and "all encouragement was offered for any one who could find a remedy for convulsion-fits." Though these were the days of Dr. Radcliffe, a belief in amateur physicians seems to have possessed the minds of the Royal parents. Just as in a fairy tale, when the King offers half his kingdom to the person who will heal his daughter, people crowded to Court with their private nostrums. "Among the countrywomen that attended, Mrs. Pack, the wife of a Quaker, came from Kingston Wick, with a young child in her arms of a month old, to speak of a remedy which had restored her children." Prince George chancing to observe that the wife of a Quaker was a healthy-looking woman, Mrs. Pack was appointed to be the Prince's nurse. The Prince recovered from his fits, the nurse it was that died—some years later. On this sad occasion the Duke of Gloucester displayed his early possession of a Royal quality. "The Queen asked him if he was not sorry that his nurse was dead. He said 'No, madam,' for at this early age he had the faculty of forgetting even his greatest favourites when out of sight." In this trait Mr. Goldwin Smith will recognize the innate rascality and instinctive selfishness of princes. The Duke, after recovering from his convulsive fits, was carried, for the country air, to my Lord Craven's house at Kensington Gravel Pits. Somewhat later Camden House was taken, and the Prince was driven out in a coach drawn by horses "which were no larger than a good mastiff." In 1693 he suffered from an ague; but Dr. Radcliffe prescribed the Jesuit's Powder (quinine), of

which the Duke took large quantities "most manfully." His earliest articulate words, it is interesting to philologists to learn, were monosyllabic radicals, *Gig* and *Dy*, the latter of which we feel certain that many students will connect with the Aryan *Dyauz*. But it appears, on Mr. Jenkin Lewis's evidence, that *Dy* was only short for Mrs. Hutchinson's maid. Lewis now observed in the Duke a truly Royal love for horses and drums. For the remainder of his eleven years his Royal Highness incessantly played at soldiers, and displayed a becoming ambition and martial temperament. For what were Princes born but the glorious game of war? The little Duke could conceive of no more noble exercise, and (after a brief interval of wishing to be a carpenter or a smith) was drilling his servant's sons, and planning fortifications, and vapouring with sword and pistol, all day long. The faithful Lewis told him anecdotes of Cæsar, Alexander, and other martialists, and even learned fortification, to win the favour of the little Duke. But Dr. Prat, the boy's tutor, was jealous, and himself took up the study of military engineering, "which did not so properly belong to his office, or his cloth, and thereby deprived another of the opportunity of being employed." This unclerical action of Dr. Prat's chagrined the faithful Jenkin, and he withdrew from the life of a Court to the service of a French merchant in Roan, as he spells Rouen. But this is anticipating the course of his narrative.

The little Duke's first guards were twenty boys from Kensington, accoutred with paper cups and wooden swords. In 1694 he was breeched, and, being displeased with the fit of his garments, ordered his guards "to put the taylor on the wooden horse, which stood in the presence room, for the punishment of offenders, as is usual in martial law." At this time his Royal Highness's toes "turned out as naturally as if he had really been taught to do so," a grace which charmed all who were acquainted with his person. Though active and lively, he was always ailing, and seems never to have been able to go up and down stairs without help. At one time he conceived that he could go nowhere without two people to hold him, and he persisted in this fancy till his father explained to him, and illustrated with cuts, the nature and properties of the birch. But this seems to have been the only time that he was whipped, and his poor little life was a happy one enough. The Queen quarrelled with Princess Anne in a sisterly way, and deprived her of her guard. The little Duke, who was exercising his boy soldiers at Kensington, ventured to tell her Majesty "that his mamma once had guards, but had none now," which, it was said, surprised the Queen a good deal. "The King gave the boys twenty guineas; and, sad to tell, these Prætorians waxed wanton. 'They were very rude, presuming upon their being soldiers; and would challenge men, and fall on many people as they came to and from Kensington to London, which caused many complaints.' Such are the defects of the military character and the dangers of a standing army. At that time the 'Scots Dragoons' were reviewed by the King in Hyde Park. 'They were as good troops,' says Jenkin, 'as ever I saw; with caps, and fuzes, and great basket-hilted swords, very long.' The Duke observed these swords with interest, and commanded his entree to make him a claymore, with which he would 'swagger about the presence room.' With these martial tastes the little Duke combined an unaffected aversion to the exercises of religion, which, says Bishop Burnet, 'he understood beyond imagination'; nor could he be induced to attend family prayers. The Church, therefore, lost less than the Army, it may be, by his death. His memory was good, but he mainly used it in learning the terms of war by land and sea. He even thought out a very notable stratagem whereby to disconcert boarders in a naval battle. 'When we are at sea,' he would observe, 'I will cannonade my enemies and then lie by; so make them believe they may board us. I will send a boy up to the topmasts to let fall from thence a bag of *peace*, that when the enemy came to board us they will fall down by means of the *peace*, and I and my men will rush from the corners of the ship and cut them to pieces.' In this young general's opinion, the countries which a British commander should aim at subduing are France, Hungary, and Turkey. Had he lived, he meant to conquer them in detail, nor has the feat yet been accomplished by the forces of the House of Hanover, now happily settled on the throne which the young Duke did not survive to occupy. When invested with the Garter he said, 'Lewis, if I fight any more battles, I will give harder blows now than ever.' And he really thought, by being Knight of the Garter, he ought to become braver and stouter than heretofore.

But, alas! the "Très haut, Très Puissant, et Très Illustre Prince, Guillaume," grew no stouter. The ceremonial of his eleventh birthday, July 24, 1700, left him "fatigued and indisposed." On the 26th he was hot and feverish. They bled and blistered the child, and he died in a delirium on the 30th of July. His funeral was stately, and was attended by Burnet, Bishop of Salisbury, his tutor-in-chief. It had been arranged that Burnet, while acting as tutor, should spend no less than ten days yearly in his diocese. "Such," says Mr. Loftie, "were the notions prevalent at the beginning of the eighteenth century as to the duties of the episcopal office." Burnet could return to them now. He had read the Psalms, Proverbs, and Gospels to this careless little Prince, and had for two years conversed with him about geography, and "the forms of government in every country, with the interests and trade of that country, and what was both good and bad in it." The last thing I explained to him was the Gothic constitution, and the beneficiary and feudal laws." Possibly all

that learning wearied the child, yet he seems to have preserved his lively spirit to the end. He made his little *mots*, which the faithful Jenkin quotes, and appears to have been a sturdy young Prince in his mental habit, though weak of body. It is pleasant to read of his brief life, "an endless imitation" of the ways of kings. A harmless, bloodless soldier; a despot, who only scolded his maids; a child, dwelling always in fantasy, and rehearsing for the great comedy in which he was never to play, his story is more touching, we think, than fictitious romances about the deaths of precocious infants. Mr. Loftie's little volume is one that Thackeray would have delighted in; it is like a Royal version of Dr. John Brown's *Pet Marjory*, and we almost regret that, as at present published, the book can reach so few people.

#### THE PHYLLOXERA CONGRESS AT BORDEAUX.

THE postponement of the Congress from the beginning of September proved somewhat unfortunate for those who had come from a distance to attend it. The vintage had long been over, and the opportunity was wanting of seeing one of the most palpable evidences of the ravages wrought by the Phylloxera in vineyards attacked by it as compared with those at present untouched. The practised eye of an expert recognizes its presence in a moment on the diseased plants. But for a stranger, unless matters are very bad indeed, and the vines are actually moribund, it is easy enough to confound actual unhealthiness with the natural tints of the foliage in autumn. Nor are the small galls usually found on the leaves in France, which in the case of the vines of America, and too often those of English gardens, are so significant a symptom. A disadvantage of a different kind was the detestable weather which usually visits Bordeaux in October. The dull lowering clouds distilled an irritating drizzle through the hot steamy air, and this scarcely intermitted during the whole week, except to be varied by sharp gusts of rain driving in from the Atlantic. Under more favourable circumstances Bordeaux would be impressive. Nothing can be more unlike an ordinary seaport than the splendid curve of its quays, lined with handsome houses and stately public buildings. But this external magnificence by no means compensated for the discomfort of hotels infested with mosquitoes and the squalid dinginess of the Alhambra, in which alone, apparently, it was possible to find a room of sufficient size for the meetings.

The International title given to the Congress implied little more, probably, than a concurrence in an unmeaning fashion. A Society does not become international because foreigners are occasionally present at its meetings, or even make communications to it. A few foreign representatives were present at Bordeaux, but the practical value of the deliberations of the Congress will undoubtedly depend on the fact that it was essentially a gathering of local men intensely in earnest in combating an enemy which to many of them menaces nothing short of absolute ruin, or at least of total loss of future income. A vague scheme for international action was brought forward at an early meeting only to be promptly referred to a Committee for report, and subsequently summarily rejected.

The scene of the nocturnal revels of the *bourgeoisie Bordelaise* is in the outskirts of the city. The great ballroom, all but unprovided with external windows, was lighted throughout the week with gas. But the available space was thronged, and it would be difficult to imagine a more curious spectacle than the opening meeting, when M. Lalande, the President of the Chamber of Commerce, appeared in the musicians' gallery, which for the occasion had been turned into a tribune, to deliver his address in the presence of the Cardinal-Archbishop and all the official notabilities of the Gironde. The proceedings of the meeting had been skilfully organized beforehand. Committees had been appointed to collect information and report to the Congress on the principal heads of discussion. As the result showed, considerable tact had been used in arranging the matters of debate, so as to keep those to the end on which anything like controversy might be expected; and it is probable that the whole proceedings will possess much more practical usefulness than usually results from such gatherings.

Every one is now aware that the two great districts of Phylloxera infection in France centre round Marseilles and Bordeaux. In the latter case the mischief is to a great extent confined to the north bank of the Garonne. Dordogne and the eastern part of the Gironde have been ravaged, and in large districts of Charente Inférieure and Charente the vine has been practically exterminated. The latter department was the principal seat of cultivation of the strong white wines used in the manufacture of brandy. The stony soil of the hill-sides is all but useless for any other purpose, and the ravages of the Phylloxera have simply destroyed the means of livelihood of the small proprietors. On the low-lying lands matters have been scarcely so bad, as it has been possible to grow other crops, which, however, at the best are but an inadequate substitute for the lucrative culture which they have replaced. Hitherto, however, the Médoc, the curious spit of land running northwards between the Garonne and the sea—a district which will be for ever memorable as the seat of production of the finest products of viticultural art—has comparatively escaped. But the proprietors have now thoroughly grasped the fact that they have only a period of respite; the march of the inexorable Phylloxera cannot be stayed; and if the consumption of fine wine is still to be preserved amongst the

amenities of life, the day of grace, which will be so soon past, must be utilized to the utmost. The wine-growers of the Charente have borne the brunt of the battle. While the campaign against the Phylloxera was being organized they saw their property disappear before their eyes; amidst the conflict of uncertain remedies, the real value of which only experience could determine, they hesitated in inaction. But it is not impossible that their sacrifice may be the salvation of the Médoc. The Congress has had the merit of laying before a large body of vine-cultivators the best information which the combined experience of practical men and scientific experts can afford; and certainly, if assiduous attention at meetings prolonged, with short intervals, from half-past eight in the morning till nearly midnight counts for anything, the trouble taken will not have been wasted. In England, congresses are seldom more than opportunities for somewhat ponderous dissipation, for which the reading of papers is little more than an excuse. But at Bordeaux matters were very different; dissipation there was none, and the speakers who turned out, in full evening dress, at the English breakfast-time to speak by murky gaslight never failed in receiving the attention of a large audience, sometimes almost too vivacious in its interest.

The Reports of the Committees, which had spent some time in visiting various districts of the South—where trial had been made of different remedial methods—were printed, and distributed during the meetings. These methods may be divided into two groups—those which have for their object to free the vines from the parasite which infests them, and those which seek to cultivate the vine under conditions which render it independent of its attacks. Methods of the former kind are, of course, the earliest in date, and they are still not without their strenuous supporters. Those who have advocated particular expedients—doubtless at the moment the best that could be adopted—come at last to feel a kind of vested interest in them and a sort of jealousy at their supersession. But, apart from this, the advocates of what, it must be feared, is at the best but a palliative method of treatment, have a very natural ground for anxiety on their side. A very slight study of the conditions of vine-culture in the more valuable vineyards is sufficient to reveal the fact that the growth of what may be termed high-bred vines is a singularly artificial matter, the conditions of which are most delicately balanced. One of the greatest difficulties of vine-growing is to determine the particular kind out of the immense number known (the mere catalogue of which forms a volume), which is suited to the soil and physical conditions of a particular locality, and it is not unusual to find in the same vineyard a vine which bears abundantly on one side of a road, unproductive and all but sterile on the other. Quite apart from the Phylloxera much money has been lost by planting vines without previously ascertaining the kinds which are likely to succeed. It is not to be wondered at, therefore, that the cultivator should wish to do anything rather than interfere with the vines themselves when their produce is a valuable wine.

The Phylloxera (which, it may be remarked, is an insect not very remotely allied to the *aphides* of our gardens) is capable of leading in different stages both an underground and an aerial life. During the former it attacks the ends of the minute fibres of the roots, producing at first small but very characteristic gall-like swellings upon them, and finally bringing about their decay and death. The vine endeavours to repair the loss by putting out a fresh crop of rootlets, and these succumb in their turn. But this reparation is at the expense of the plant's reserve of nutriment, which should properly be directed to the support of its annual growth of grape-bearing shoots. The Phylloxera kills the vine therefore by a slow but inevitable process of depletion. As the injury proceeds the rootlets are all destroyed; the insects migrate to the older roots, upon which they are visible to the naked eye as a fine sulphur-like dust. Many of the smaller cultivators have hitherto been content to endeavour to feed the starving vines with increased supplies of manure, a course of procedure which finds no support from the Congress Reports. "The most stimulating manures and the most assiduous cultivation may retard somewhat the ultimate destruction of the infected vine, but cannot in the end arrest it." The Phylloxera may, however, be killed, and one of the most effective methods is to drown it by irrigating the vineyards during the winter. This method, even where it can be practised, is not without difficulties. Some vines are thrown by it too early into leaf, with the result that the flowers do not properly expand and the crop is correspondingly diminished. Nor, inasmuch as the vines still remain open to fresh invasions, is it sufficient to confine the operation to a single year; it must be frequently renewed, and this where the water has to be pumped on to the land is a serious item of expenditure. But in the vast majority of French vineyards the remedy is inapplicable, as the vineyards cannot be flooded; where, however, it can be done (especially with river water which enriches the soil as well), the excellence of the results was attested by numerous speakers.

The various insecticides, the use of which has been urged by the Commission of the French Academy, besides being supported by State subventions, next passed under review. Of these, sulphate of potassium appears to be admitted to be the best; but the cost is considerable, and apparently altogether beyond the means of cultivators who aim at producing nothing more than ordinary table wine. Bisulphide of carbon is more economical, but its use is not without risks; apart from fatal accidents to the workpeople, if its application is followed by rain, the pores of the soil become clogged, the bisulphide is not dissipated through the

soil, but remains too long in contact with the roots in too concentrated a state, and the vines are killed. A more fatal defect in the application of this particular class of remedies is that in the poorer and more stony soils they appear to be inefficacious, and even under the most favourable circumstances it is necessary to repeat them annually. Professor Mouillefert, who is the official advocate of the treatment of the Phylloxera by chemical insecticides, attended the Congress, and was not altogether in accord with the conclusions of the Committee. But he somewhat weakened his position by contending that the Phylloxera, by raising the price of wine, was rather a benefit to the proprietors than an evil—a line of argument which was by no means to the taste of the audience.

The most important discussions were those of the concluding meetings, which were occupied with the questions raised by the Report of the second Committee, the object of whose labours was to examine the conditions under which the culture of the vine could be continued in the face of the attacks of the Phylloxera. This apparently is possible for the European vine on very sandy soils, a point which was admitted without dispute; the effect of this will be to carry the culture of the vine nearer to the sea than formerly, and materially to raise the value of large tracts of land in the districts of the Landes and elsewhere which have hitherto been regarded as all but worthless. When, however, the question of American vines was reached the proceedings became much more animated, and, with a less skilful chairman, would have probably drifted into hopeless disorder. The whole subject has so recently been brought before the readers of this journal in a review of the remarkable papers of the Duchess of Fitz-James that it is not necessary to explain the facts at any length. As is well known, the American species of vine (which are altogether distinct from the European) can tolerate the attacks of the Phylloxera without injury. This has largely been taken advantage of in the southern districts round Marseilles, as well as in Languedoc. American vines are either used as "direct producers" of wine or as stocks on which the European kinds are grafted. The former fact might well be regarded with dismay if there were any chance of the produce of American vines coming into immediate competition with the finer produce of the European. Even in America the wine made from American grapes rouses anything rather than enthusiasm. The vines of Europe have been the insensibility growth of centuries of development; they are as much products of art as a violin. American vines in the nature of things are nearer to their uncivilized state, and one might as well place a tom-tom in the hands of a Joachim as offer American vines to the wine-growers of the Médoc to replace those they now cultivate.

The vast bulk of the wine produced in France is intended for daily ordinary consumption; of this the supply is no longer sufficient even for the needs of the country. At present the wine which has most deteriorated is the *vin ordinaire*; on the inn tables of the South one too often finds, instead of a wholesome *vin du pays*, a horrible fluid known to the initiated as *vin de sucre*, which is made by adding sugar and as much water to the *marc* as wine has been expressed from it, and then fermenting again. No one seems to have thought of this device till the Phylloxera came; but in a country where even the children of peasants refuse to drink water, it is the only way in which an adequate supply of anything in the semblance of wine can now be kept up. The American vines which are most in favour as "direct producers" are the Jacquez and the Herbemont; these are varieties of *Vitis californica*, the fruit of which is destitute of the "foxy" taste so nauseous in *Vitis Labrusca*. In the exhibition held in rooms adjoining the Congress, branches laden with grapes were shown of the Jacquez which the spies might have brought from the Promised Land. The wine made from it is thought to have great merits on account of its depth of colour and richness in alcohol. The specimens shown at the Congress, however, can only be described as resembling mulberry juice diluted with vinegar. Wine made from Herbemont grapes is said to be inferior to Jacquez in strength, and more delicate—a description which, tested by experience, seemed so far true that it resembled Jacquez with the greater part of the mulberry juice omitted.

Both the Jacquez and the Herbemont are put to more legitimate use as stocks for grafting the European vines. The Jacquez answers well for this purpose in the South, and its range of successful cultivation corresponds with that of the olive. In the South-West it is not to be depended on, and the Herbemont takes its place. But the chief reliance seems to be placed on the Riparia variety of *Vitis cordifolia*. The vine-growers of the Gironde seemed at first rather disposed to regard the enthusiasm for grafting shown by those of the South with hesitation, if not impatience. And the merits and demerits of American stocks have even in some extraordinary way got mixed up with purely political questions. But it was impossible to watch the progress of the often excited debates without feeling that the American stocks were steadily gaining ground. The present condition of the vineyards of the Médoc is a thing to be as little tampered with as possible. The ultimate fate of Venice is probably to lapse to ruin, not by the crumbling of its palaces, but by the decay of the piles on which they are built; yet the foundations may be renewed, but the palaces never. The vines of the Médoc are in a similar predicament; but if their roots can be replaced with others which have an immunity from Phylloxera, the vines may still, there is good reason to hope, produce their wines unaltered on the old vineyards. The stocks which it is proposed to employ bear grapes themselves which have

no foxy taste, and the possible risk of injuring the delicate qualities of the world-famed wines by contamination from the stock seems to excite little apprehension. The only open question is the effect on the yield, and in this respect diametrically opposite opinions have been expressed. On the one hand, appeal is made to the general experience that grafting increases productiveness, while on the other the result of actual experiment is said to be that in the case of the vine the yield is diminished. On the whole it can hardly be doubted that the Bordeaux Congress has done much to settle the indecision as to the Phylloxera policy of France in the future, and the members were not tardy in admitting their indebtedness to the enterprise of the Duchess of Fitz-James and to the labours of Professor Planchon in showing them the way.

#### IVAN TURGUENIEF.

THERE is at present staying in this country a guest who is not only the greatest writer of fiction ever produced by Russia, but also one of the greatest of living European novelists, Ivan Serguéievich Turguenief. His visit may be taken as an occasion for saying a few words about his works, especially as regards their tone and drift. We will take it for granted that they are well known to our readers. It is true that the English translations of his novels have not obtained among us the wide circulation which they have gained in America, where a series of many volumes devoted to his writings has been published (Henry Holt & Co., New York). But it may safely be asserted that, in those of our households in which real culture is to be found, there will a full appreciation of Mr. Turguenief's admirable work be found also.

Within certain limits Mr. Turguenief is now acknowledged throughout Europe as reigning supreme. Now that we have lost Balzac, Thackeray, George Sand, George Eliot, and, among others, that fine writer whose method Mr. Turguenief's closely resembles—Prosper Mérimée—there exist but few writers who can compete with the Russian novelist in his power of raising the veil which hides from the outer world the secrets of a man's inner life, of bringing to light the obscure springs which regulate or disturb his career, and more especially of tracing the blind paths which are so apt to mislead in that dark forest to which a Russian proverb compares a maiden's heart. His characters are no mere wax-work figures, "painfully" elaborated into a simulation of life. They live and move and breathe, as a Russian folk-song might say, "with an heroic breath." In this point Mr. Turguenief stands high above some careful psychological analysts, who in the most creditable manner dissect and poke and pry and weigh. Their results deserve respect, but it resembles that which we pay to a corpse. Their figures are like the slain heroes in the Russian folk-tales on which the resuscitating Water of Life has produced its first effect. Sprinkled over the mangled remains of the dead man, it at once consolidates his scattered fragments, healing every wound and obliterating every blemish. But it is not till a second operation is performed by the dispenser of the magic balm that the corpse becomes a living man. Fully alive are the men and women with whom Mr. Turguenief has made us acquainted. And so lovable are many of them that we often forget the skill of the artist and the beauty of his art, thinking only of the sorrows and successes of the men, the grace and charm of the women, whom he has added to the list of our unknown friends. If to these merits are added those which he possesses as the wielder of a style unrivalled for delicacy and seldom equalled in force, it will be easy to see that in his own field he stands alone. If any one is inclined to dispute this conclusion, let him turn for a proof of Mr. Turguenief's power to the scene ("Father and Sons") in which the dying Bazarof, that modern Russian Titan, closes his eyes on the world for which he had hoped to do so much, but in behalf of which he can now do nothing but "die decently," and his distracted parents fall down together "with their faces to the ground, exactly like two lambs" (says the old servant-maid), "like two lambs in the heat of the day." Or let him read those most tragic of pages in which is described the funeral of the poor girl ("The Unhappy One"), brought to an untimely end by the slow but steady torture to which she is subjected by her unrelenting stepfather, who scatters the dust over the coffin to which his cruelty has reduced her "with the air of a man who is stoning an enemy." If it be the perfection of delicacy and grace of which he desires a specimen, let him take those chapters in which Liza ("Nichée de Gentilshommes"), one of the most charming of all characters of fiction, takes leave of the room in which so much of her calm and contented childhood and youth has been past, setting all things in order, giving each flower a caressing touch, and doing all "deliberately, quietly, with a kind of sweet and tranquil earnestness in the expression of her face," after having made up her mind to devote the rest of her days to the convent in which he whom she had loved so tenderly, from whom only an undeserved disaster had parted her, sees her once as she crosses from choir to choir, passing close beside him, "passing onward steadily, with the quick but silent step of a nun, and not looking at him." Seldom has a sadder termination to a story been written, and yet it does not leave behind it a painful impression. The sadness is not of a depressing nature. Rather is it elevating and ennobling, akin to the sort of melancholy solace inspired by the sight of a calm and grand autumnal sunset. For Mr. Turguenief

never wantonly and unnecessarily harrows the feelings of his readers. If he wishes to touch their hearts, he produces the desired effect, not by the vulgar means which lie at the door of every literary surgeon or undertaker, but by appeals to their highest sympathies. Even when he was most in earnest and least in hope, when he began to call attention by his "Notes of a Sportsman," in the time of the Emperor Nicholas, to the sad condition of the enthralled peasantry of Russia, he never resorted to such descriptions of the knout or the dugeon as form a great part of the "properties" of the inferior dramatists who have brought similar subjects on the stage.

This reticence, this self-restraint on his part, greatly enhances the charm of his work. Scarcely any other novelist has been able to produce such marked results by such simple means, to produce a striking portrait by so few strokes. Take as an instance of his extraordinary faculty of rapid and correct sketching, the figure of Lenon, the German music-master, in "Liza." The poor old artist has but a very small part to play, and but seldom emerges from the background. But he can never be forgotten by any one who has read that story aright. What has been said of Mr. Turguenief's figure-pieces applies equally to his landscapes. A few words serve to bring vividly before our eyes the scenes through which move the characters of his tales--the level plain, green in spring, and golden in autumn, and white in winter; the steep bank leading down to the slow river; the "dreamy" forest, with its columned aisles. In the same way his village or town interiors are rendered by the fewest of touches more distinctly and permanently visible than the majority of similar pictures on which the labour of long hours has been lavished. Of one other charm of his works, their exquisite felicity of diction, it is useless to speak here. It can only be appreciated by those who can read them in the original Russian.

We have already assumed that our readers are familiar with Mr. Turguenief's principal works. Almost all that he has written has been translated into French and German. And in America English translations have been published of "Fathers and Sons," "Smoke," "Dmitry Roudine," and "Spring Floods," as well as reprints of versions which had previously appeared in England, including those of "Liza," "On the Eve," and some short pieces. So that there is but small excuse for any one's remaining stolidly ignorant of some of the finest work which any novelist has ever produced. It is to be hoped that the translator to whom Mr. Turguenief has confided the translation of some of his most exquisite tales will soon be able to accomplish his task. Among their number may be specially mentioned "Faust," that wondrous study of the new world opened by the perusal of Goethe's work before the astonished gaze of a girl who had been brought up in as complete an ignorance of fiction, whether in prose or verse, as was enjoyed in the matter of reading and writing by the heroine of the "Golden Butterfly"; and "Moomoo," the story of a deaf and dumb giant of a man who cared for nothing in the world but his dog, and was compelled to kill it because it first despised and then disturbed the great lady whose house-porter he was--a story in reference to which Mr. Carlyle said to the present writer, "I think it is the most beautiful and most touching story I ever read." Of the immense amount of light thrown upon recent events in Russia by Mr. Turguenief's later works, beginning with "Fathers and Sons," and ending for the present with "Virgin Soil," it is unnecessary to speak. That has been universally acknowledged. Still more will the dark places of revolutionary Russia be illumined when his forthcoming novel appears, in which he proposes to show how great a gulf divides the Socialism of Russia from that of Western Europe. But we will not now touch upon any vexed question.

We have said something about Mr. Turguenief's merits as an artist. We will now devote a few lines to his moral teaching. Seldom has there lived a writer of fiction whose work has been from first to last at once so lofty and so pure. With the subtlety of a French novelist he has combined the healthy and vigorous humanity of such writers of our own as Scott or Thackeray. And therefore his works may be as highly valued for their moral as for their æsthetic merits. One fault has sometimes been laid to their charge, that of being over sad. It is true that the Slavonic melancholy often casts a shade over their scenes, and their melodies are, like Russian folk-songs, frequently set in a minor key. But that Mr. Turguenief is a genuine humourist, capable of exciting the healthiest of laughter, can never be doubted by any one who has read his tale called "The Dog," which has been translated in *Temple Bar*, or his as yet untranslated dramatic sketch entitled "A Breakfast at the House of the Marshal of the Nobility."

We will conclude with a few words about the translations of Mr. Turguenief's works. Those in German are usually quite faithful, but are sometimes a little heavy in style. Those in French are for the most part excellent, having been executed under the author's eye. But some of the English versions are as bad as bad can be. The translation of "Smoke" from the French, which appeared in 1868, was probably the worst version of any book ever made. It is a rare book now, having, we believe, been suppressed in consequence of a single shot fired by one of our contemporaries. As specimens of its merits the following may be taken:--"Au fond, c'est un imbécile," appeared in English as "He is quite a child, at the bottom"; and where the author said that his charming heroine, in consequence of her long troubles, "avait un peu maigri," the translator made him declare that she had "grown a little stouter." But perhaps the

greatest outrage on the part of a translator from which Mr. Turguenief has ever suffered was committed by the English translator of "On the Eve." Of this particular version a Russian critic remarked that it was a model of everything which a good translator should avoid; and no wonder, considering that the book swarms with such abominations as the amplifying of the words, exactly characteristic in their simplicity, "the larks sang, the quails called," into "the larks were singing above them, and the chant of birds was to be heard all around," and such utter blunders as the statement that a sculptor, who really jumped up and kicked himself three times behind, "bent his knee three times, each time touching the ground with his forehead." But the unkindest of all the translator's offences was this. Mr. Turguenief describes his enthusiastic heroine as suddenly discovering one morning that she was in love. In spite of the sunlight, he goes on to say, she suddenly opened her arms and exclaimed, "Oh! if he only loves me!" The translating "traitor" makes him affirm that the young lady, "unabashed by the light that shone in upon her--threw off the clothes." The force of bathos could no further go. The American reprint of this precious production claims, on its title-page, to be provided "with amendments." But this almost splendidly mendacious passage remains unamended. The explanation of the blunder seems to be that the translator mistook the Russian word *obyatie*, "embrace," for *odeyalo*, "a counterpane." They both begin with the same letter. England owes Mr. Turguenief amends for such an outrage. We trust that his present visit to our shores may serve to efface its memory.

#### THE DRAINAGE OF THE ROMAN CAMPAGNA.

THE researches, published two years ago, of Professor Klebs of Prag, and Professor Tommasi-Crudeli of Rome, on the nature and origin of malarious fever have not only proved of importance in the development of the germ-theory of disease, but suggest historical questions of the greatest interest, towards the solution of which some steps have already been taken. In the current number of the *Practitioner* there is a most instructive paper by Professor Tommasi-Crudeli, summing up the results of former publications on the nature of the microscopic plant by which malaria is produced, and discussing more fully the historical side of the matter. How is it that the Campagna, now so deserted, was once populous? How is it that it was not merely inhabited by people who could live nowhere else, but that it was studded with the villas of wealthy Roman proprietors, who chose for their places of recreation spots now shunned as the worst haunts of disease? The question has often been asked, but till lately no answer has been offered which rested on any basis of fact or science. The answers were all guesses, because they were made, first, in ignorance of the true nature of the disease itself against which the ancient inhabitants of the Campagna contrived to struggle with success, and, secondly, before any sufficient excavations had been made to show whether, as has been conjectured, there was in old times a complete system of drainage of which the outward traces are now lost. The transfer of the seat of Government from Florence to Rome, and the consequent extension and partial rebuilding of the new capital, have caused many new excavations to be made inside the city itself. Outside the walls the same thing has happened. Many of the landed proprietors are now busy on improvements, in the course of which new facts as to the soil and drainage of the Campagna have come to light; and, besides this, various excavations have been undertaken with the direct object of solving a problem which has now a practical as well as an archaeological interest. If the Campagna was habitable and fertile in the days of the Romans, there is hope that it may be made so again. The economic gain to Italy, could this be done, would be enormous, not only from the vast spaces which would then be reclaimed to cultivation, but from the thousands of human lives saved from death or permanent enfeeblement. Malaria is often fatal; but even a slight attack, as any one who has suffered from it knows to his cost, may be for years a serious injury to the constitution, and may diminish by a heavy percentage, even when a man looks outwardly healthy, his number of working days throughout the year.

The researches of Professor Klebs and Professor Tommasi-Crudeli, now generally accepted by the medical profession, established that malaria is due to a specific microscopic plant which exists in the soil of certain districts and floats in the atmosphere above it. This plant, when inhaled and absorbed, finds in the human body conditions favourable for its growth and reproduction, and it prospers and multiplies at the expense of the organism in which it dwells. The mode of combating it is twofold--first, to find suitable and, if possible, inexpensive remedies for it and prophylactics against it; and secondly, to prevent, if possible, its generation and multiplication in the soil itself. The conditions necessary for its development have been found to be--first, a temperature of not less than 60° to 70° Fahrenheit; secondly, a moderate, but not excessive, degree of permanent humidity; and, thirdly, a free supply of oxygen. "The absence of any one of these three conditions is sufficient to arrest or render impossible the development and multiplication of this organism." It is necessary to clear our minds from the old prejudice that malaria exists only, or even chiefly, in marshy soil. The Campagna, as it happens, is not really marshy. Professor Tommasi-Crudeli is of opinion that, speaking roughly, two-thirds of the malaria-stricken districts in Italy are situated on high

"Sometimes," he says, "the surface of these districts is completely dry during summer, but the production of malaria in them goes on just the same, provided they are kept moist below the surface by special conditions of the subsoil, and the air can reach the moist strata by pores or crevices in the surface. This is precisely the condition of the greater part of the rising grounds in the Campagna of Rome." Further, the direct action of the oxygen of the air is so necessary to the development of the plant that the most pestilential marshes become innocuous when the soil is completely covered by water. Pavements, buildings, and the like, may act in the same way and arrest the development of the plant by cutting off the necessary supply of oxygen. But if, even after the lapse of years or of centuries, communication with the outer air is restored, while the other conditions remain the same, the soil recovers its noxious properties. Again, a very moderate amount of moisture suffices to evoke malaria, when other conditions are favourable, as is shown by the fact that malarious districts may be safely inhabited during a very hot and dry summer, but that the first shower of rain is followed by an outbreak of the disease. Here, in fact, lies the practical knot of the question. If a large, instead of only a small, amount of water were requisite for the development of these germs, the problem would be comparatively simple, for any ordinary system of drainage would meet the case. "Neither hygienists," says Professor Tommasi-Crudeli, "nor engineers have as yet faced the problem from this point of view; for all medical schools are still dominated by the paludine prejudice, namely, by the idea that malaria is produced exclusively in marshes or in localities analogous to marshes. The natural consequence of this prejudice has been the concentration of the attention of those who have tried to hinder the production of malaria upon marshy localities. They have completely ignored, or at most have hardly recognized, the most important part of the problem of disinfection—namely, the disinfection of malarial districts which are not, and never have been, marshy."

The Roman Campagna, which, when seen from a distance, presents the appearance of a vast level expanse, is in fact, as those who have walked or driven over it will remember, very far from being a plain. It consists, on the contrary, of a series of undulations, some of them of considerable height. Though the annual rainfall is inconsiderable, it is a curious fact that this district is remarkably rich in springs and ponds of water, which do not disappear even in the dry and arid Roman summer. From what source, then, are these supplied? The conclusion at which the writer, with others who have studied the problem, has arrived, is as follows. The old volcanic craters which rise above the Campagna on both sides of the Tiber are now either lakes—as, for example, the Lakes of Bracciano and Baccano on the north of the Tiber, and of Albano and Nemi on the south—or else they form close basins, such as the old Lake Regillus, the valley where Aricia once stood, and the valley of the Molar in the Latian hills. The lakes are some of them very deep, and the downward pressure which they exercise must be enormous. The water which accumulates in them, having no other outlet, or no sufficient outlet, filters gradually down through the subsoil of the district (much of which is of such a nature that it readily allows of the passage of water through it), thus moistening the whole of it, and accumulating in greater quantities here and there, according to the character and disposition of the strata through which it passes. It is this water, permeating the whole subsoil of the Campagna, by which these perennial springs and ponds are fed. Now for a long time past, when excavations have been made in the volcanic tufa of the Campagna, small tunnels, about five feet high and one foot eight inches broad, have been met with. The common opinion has been that these tunnels were used as conduits for drinking-water. The most recent view, taken by the writer above quoted, is that they have nothing to do with conduits or cisterns or sewers, but that they are remains of an extensive system of drainage.

We cannot enter into a full description of this system of tunneling, but must refer our readers for details to the essay in the *Practitioner*. These tunnels, with their smaller branches and connexions, have now been found in so many parts of the Campagna and of Rome itself, their position and arrangement are so precisely adapted for purposes of draining, and there is so much in their construction that is inexplicable on any other hypothesis, that the truth of the drainage theory may be safely assumed, at all events provisionally, as the basis for further and closer investigation. In some of these subterranean passages the picks used by the miners have been found, and a cramp, probably used to hang the workman's lamp upon. "On the walls and vault of these tunnels the volcanic strata are quite exposed, and one could count the strokes of the pick upon them, as if the work had been finished yesterday." The extensive excavations made in the construction of the new fortifications of Rome have offered increased opportunity for studying these remarkable remains. Where the permeable nature of the subsoil renders these drainage-tunnels superfluous they are not found. "We often find several networks of tunnels superposed, so that the hill is perforated like a beehive through its whole height. The Aventine, for instance, is perforated by four strata of these networks below the Church of Santa Sabina. On the Quirinal, under the foundations of the new War Office, two strata have quite recently been found, one at a depth of 33 and another of 56½ feet. Sometimes the different strata communicate with one another by means of several vertical wells, and the inclines of the upper strata are calculated so as to throw the drainage waters into the stratum below. The majority of these drains run entirely underground. It is very rarely that

we happen to see a gallery destined exclusively to receive the direct drainage of the vegetal soil. More often we meet with galleries whose general course is subterranean, but from which several branches rise above the surface of the subsoil and drain the vegetal soil directly."

Two questions naturally suggest themselves in reference to this investigation. First, what is the date of this vast and complicated system of drainage? and, secondly, how is it that ancient writers are silent about it? The probable answer is that it was a phenomenon so familiar that for that very reason it passed unmentioned. The fact, also, that both Livy and Cæsar, who, when they describe siege operations, enter frequently into the minutest details, are content to say simply that a mine or tunnel was made, is significant, and seems to show that tunneling was a process understood by every reader, and requiring no explanation. Further researches are necessary before even an approximate date can be assigned to these works; but the silence of the historians makes it probable that they are of the greatest antiquity. For there is not even a tradition on record as to when or by whom they were made. It can hardly be supposed that, had the drainage of the Campagna been carried out within human memory, so remarkable an undertaking would be passed over without any mention whatever being made of it. It seems, therefore, not unlikely that the aptitude for operations of this kind which characterized the Roman people, and which still, curiously enough, is to this day possessed by the Roman workman, should have been acquired in prehistoric times. Whether, again, the works were undertaken primarily for agricultural purposes is a question to which it is hard to give any definite reply. But it is evident that, if not intended for, they answered, hygienic ends. We are now, however, only on the threshold of an inquiry as interesting on its historical as on its scientific side. It is one on which more light will be thrown every year, now that the start has been made. Though the solution of the question is of infinitely more practical importance to the Italians than to any other people, we trust that English archaeologists may help to throw light on the many interesting and obscure points in which this investigation abounds.

#### CENTENARY OF THE ROYAL TOXOPHILITE SOCIETY.

IT was determined early in the year by the members of this Society that something should be done when the time arrived to mark the centenary of its existence, and various suggestions were made as to the form the commemoration should take. Centenaries of persons or institutions generally present something characteristic of their *raison d'être*, and it was rightly felt that neither a big dinner nor a big dance (after the manner of those held some thirty years ago in the Archers' Hall) would exactly suit the occasion. A representative Archery Meeting was finally decided on as the most natural and appropriate form of recognition, and steps were taken to secure the presence of the best archers in the country.

A hundred years ago, just as the Archers' division of the Honourable Artillery Company and the Finsbury Archers were becoming extinct, Sir Ashton Lever and fourteen others formed themselves into a Society which they called the Toxophilite Society; and, as some of them were the actual survivors of the two expiring Clubs and brought with them their valuables, the Toxophilite Society became their direct successor. It has not from the first been installed in its present convenient and secluded grounds. Its infancy was passed at Leicester House, Leicester Square, better known of late years as Savile House; and the members used to shoot on a lawn at the back, where Lisle Street and Gerard Street now stand. The space here was limited, and the more important target meetings were therefore held at Highbury Barn, Canonbury House, or the grounds of the Honourable Artillery Company. In 1791 the Society moved further north, to ground between what now forms the west side of Torrington Square and the east side of Gower Street; but in 1805 the space was required for building purposes, and the Society was without any shooting grounds until 1821, when it moved to Bayswater. There it continued until 1834, when it acquired a lease of the quarters it now occupies. It earned its prefix "Royal" in the days when George IV., then Prince of Wales, joined it and used to go and practise at the butts behind Leicester House. Since then William IV., the late Prince Consort, and the Prince of Wales have each in turn become its patrons. The members, who at one time mustered as many as 168, are now restricted to 100, without the Committee, and the conditions of entrance are much the same as those of other London clubs; the annual subscription is lower than that of many, and its attractions are numerous and substantial. A member may, if he chooses, secure the whole place to himself on one day in the week, so as to entertain his private friends; and the lady members of his family have the privilege of practising there on all but target days. Should he reside in the neighbourhood, there is the opportunity of an hour's shooting in the morning on his way to business, and another hour on his return, only limited by the presence of lady archers. Through the summer and autumn months a target meeting is held once a week, when challenge and other prizes are shot for. In the winter, the shooting-ground is flooded to the depth of a foot or less, and in a hard frost members can skate with a safety, privacy, and comfort not to be met with elsewhere.

With regard to the present centenary, as soon as it was settled

that the most suitable way of celebrating it would be to hold a two days' meeting, to which the best shots of other Societies should be invited, a sub-committee set to work to bring together such a gathering of English archers as would use their bows in a manner worthy of the occasion. This gathering took place on the 12th and 13th instant in the Society's grounds in the Regent's Park, and the competitors numbered 65. Of these rather more than half were Loyal Toxophilites, and the rest were for the most part good shots selected from the Woodmen of Arden, the West Berks, and other Societies. A very handsome silver jug, presented to the Society in 1834 by William IV., was shot for, in addition to numerous money prizes, and a handicap, based on the first day's shooting, gave an extra zest to the final struggle. Twelve pairs of targets were used, the ordinary York Round was shot—i.e. 72 arrows at 100 yards, 48 at 80, and 24 at 60—and the shooting occupied just five hours each day. This is not the place to describe at any length the details of the contest. They would be unintelligible to many of our readers, and without interest to others; and the select few who would appreciate them must therefore refer to the full report in the *Field* of October 15. It may, however, be stated that Mr. Palairot, the champion, made the first score, and a finer one than he has yet made in public; nor has it ever been exceeded at any of the public meetings, except by that prodigy of modern bowmen, the late Mr. Horace Ford. Mr. Palairot's score was 1,062 from 210 hits. Next to this, but some way behind, was Mr. Rimington's score of 872 from 194 hits; then came Mr. Bridges with 835 from 191 hits; Mr. Prescott with 806 from 190 hits; Mr. Piers Leigh with 775 from 181 hits; and Mr. Pardoe with 753 from 175 hits. These were the six top scores, the first three being made by members of the Royal Toxophilite Society and the next three by members of other Societies. These scores, with the exception of Mr. Palairot's, were, however, not fair specimens of what the performers can do and have recently done. This may be accounted for in many ways. It is late in the season for archery; there was a strong wind blowing during the whole of the 100 yards' shooting, the light was very bad on both afternoons, and every one was complaining of the cold. In addition to these drawbacks, the importance of the occasion and the knowledge that much was expected of them may have had a demoralizing effect on the nerves of the competitors. The best gold of the meeting was made by Mr. Bridges at the 80 yards' range on the afternoon of the second day, and it all but broke the pinhole. Five hundred other golds were made (of which Mr. Palairot contributed 23), and 110 were central enough to be measured—this being done by Mr. Follett, who acted as judge. The number of golds is significant, if it be mentioned that in 1791, at a grand gathering of nearly two hundred archers at Blackheath, the gold was only struck seven times during the day, whilst two persons were slightly wounded by standing too near the targets. From there being no details in the records of the Society of the scores made at its first target meeting in 1781, no comparison with last week's results is practicable. It is known, however, that there were eleven shooters on the occasion, and that they made 29 hits between them; but no information is to be found as to the number of arrows shot, the range, or the size of the targets. It may be safely asserted that, as a rule, the number of arrows being equal and the size of the targets the same, the gold would be more frequently struck now than the target was then. It is during the present generation that archery has received its greatest impetus. Numerous clubs have sprung into being, and the standard of archery lore among the better shots is considerably higher. Mr. Ford's book, *Archery: its Theory and Practice*, has been in such demand that it is not to be met with now except by chance at a bookstall; but it has done good work, and its sensible advice has been carefully studied by those who were anxious to get the best hints on the subject. No two men ever shoot exactly alike, and it is surprising to find how few there are who have adopted Mr. Ford's principle of aiming, to which much of his fine shooting was doubtless due. The ways of aiming are so multitudinous and inexplicable that it is no longer safe to trust the old maxim that a man is known by his aim, not by his arrow. As a matter of fact it is by his arrows he is known nowadays, for every archer must have his name or distinctive mark upon them. The better shooting has helped to improve the quality of the bows and arrows. Made of wood thoroughly seasoned and scrupulously "clean," they are turned out with a strength and finish that are the envy and despair of even skilled American workmen. And so, with excellent materials, good examples, a thorough mastery of the art of shooting, and an abandonment of the pet theory of drawing the arrow to the ear, archers are plentiful enough now who would have astonished the merry outlaws of Sherwood Forest.

Although the Society has lost several volumes of minutes of its proceedings, and in spite of the scant records of its early shooting, many curious and interesting facts remain in its books. Some relate to wagers between members from 1834 to 1869, and it seems they were frequently won by men who backed themselves to shoot birds or rabbits with bows and arrows. Some describe particular feats—such as when a member in one minute shot twelve arrows into a mark 2 feet square at 46 yards, or when another put ten successive arrows into a sheet of paper 8 inches square at 30 yards. There was a rule of the Society that no game or pastime, except archery, should be played in the grounds; but it appears that one target day in 1839, when rain had put a stop to the shooting, three members were seen actively engaged in a certain diversion, commonly known under the name of "pitch

and toss." Attention was called to the infraction of the rule, and the Committee were directed to fine the delinquents 2s. 6d. each; but it was whispered that the Chairman of the Committee had himself acted as umpire during the illegal pastime, and the matter ended by his being fined 2s. 6d. and the others 1s. each. Two unsuccessful attempts were made recently to introduce lawn-tennis into the grounds where it would not interfere with the shooting; but it was considered too formidable a rival to harbour in the same camp with archery, and the proposal was rejected. The rule about wearing green or black coats on target days is strictly observed, and only last week a member was fined for disregarding it. The uniform is as simple as possible now, being merely a green coat with the Society's buttons and a green cap. In Sir Ashton Lever's time it was more elaborate, and consisted of grass-green coat with the proper buttons, buff waistcoat and small clothes, Hessian boots, and hat turned up on the right side with a black feather; and on grand public occasions ladies used to dress in the uniform of the different Societies represented. But then these great gala gatherings that were held nearly a century ago occupied a far more exalted place in the estimation of the public, and naturally, for they were conducted with much pomp and pageantry and music, and, moreover, archery as a pastime was in the heyday of youth, requiring some outward glitter to encourage its growth. Archery meetings, not too frequent in those days, were more fashionable and talked about because they were so picturesque in themselves and because there were none of the counter-attractions that abound now. The modern public meetings are shorn of most that would attract spectators, for the competition is so keen and all-absorbing that men prefer to be without noise or distraction of any sort.

The Society has begun its second centennial career under favourable auspices, and it is to be hoped that, having so successfully weathered the storms of the last hundred years, it may have strength and vitality to hold its own against all comers.

#### THE ELECTRICAL EXHIBITION AT PARIS.

THE interruption of telegraphic communication owing to the destruction of overhead lines by the late gale will no doubt again bring up for discussion the subject of underground wires. It is well known that this system has the advantage of being protected from wind and snow, which so often cause interruptions in aerial lines; but not only do long subterranean lines suffer from the retardation of the signals, caused by a static charge produced by induction, and also from interference one with the other by the inductive effect of the starting and stopping of each other's currents, but also such lines, however carefully jointed and laid, give much trouble, from the failure of insulation. As gutta-percha, the substance most generally used for the purpose of coating the wires, "perishes"—that is to say, becomes brittle and full of minute cracks—after a comparatively short time, unless it be kept always moist, as it is in cables laid under water, which are very durable. The problem of finding some cheap insulating substance which shall not act chemically on the wire, which can be readily joined, and which will not deteriorate by age, has long engaged the attention of electricians, and we had hoped to find some results of their research at the Paris Exhibition. But as yet it would appear no practical solution of the problem has been found. Some years ago Professor Abel announced to the Society of Telegraph Engineers that there were great hopes amongst chemists of getting a good insulator by combining a black substance which remains in the retorts after the distillation of Ozokerit or fossil wax with india-rubber and other substances. Some examples of compounds of this product are exhibited; but thus far they have come so little into use, that the important question of their durability is not yet answered. The same may be said of the wire coated with plaited cotton soaked in paraffin wax which is now so extensively used by the Telephone Company for making connexions in houses. So important is this question of insulation, that electricians actually consider worthy of notice so complicated a device as that of laying wires in iron tubes filled with liquid paraffin with an apparatus for supplying any loss which may occur by leakage.

We have before pointed out the importance of insulation in connexion with electric lighting and transmission of energy, and we must again insist on the point. Insulation, or rather the failure of insulation, is now the great difficulty in the way of any extensive system of transmitting large currents produced by high electromotive force. Without wishing to be alarmists, we must point out that, at all events as far as English experience goes, the danger of failure from giving way of insulation has hardly arisen; for the time since our electric light lines have been laid is not long enough to test the durability of the system of insulation. Further, the weak points of a line are always at the joints, and it is not until a very extensive system has been laid down, necessitating a very large number of joints, that the durability of any system of underground insulated conductors can really be tested. Now, for the transmission of the currents for lighting or driving machinery, such large leads are used that any extensive use of the overhead plan would be very dangerous, especially in towns, where the breaking of a wire passing over a crowded thoroughfare is almost certain to cause injury and loss of life—so that the underground system alone remains for practical purposes. In connexion with the subject of insulation, it is interesting to notice the change of system which has been made at Paris in the Siemens electric

tramway. At Berlin, where a somewhat extensive line has been laid, the road passes over porous sandy soil, which rapidly drains the surface. Here a conductor is used, laid on the ground on insulators. The same plan was, we believe, tried on the short line from the Place de la Concorde to the Palais de l'Industrie; but the rainy weather prevented its success, by destroying the insulation, and the tramcar now is supplied with its current by means of a copper bar supported on poles beside the line. The bar has a deep groove cut in its upper surface, in which run two little blocks of copper, supported on wheels, and attached to the car by flexible wire ropes. This, of course, is a return to the overhead system, and on long lines must be expensive, from the number of poles required. The overhead system has already shown its weakness for telegraphic purposes, and latterly we find that it has a tendency to produce misdirection of energy on the part of some animals; if we take up a text-book of practical telegraphy we are pretty sure to find a chapter headed "Spiders." At first the uninitiated reader naturally imagines this to be a term of art, and pictures a spider to himself as a many-legged pole, or a support for insulators with numerous arms; but the real fact is that the chapter is about common spiders, for in Europe they find the cup-shaped hollows of the telegraph insulators convenient places to deposit their egg-bags. These and the webs of the parent spiders get saturated with moisture and dirt, and so diminish the insulation of the line. In Japan, however, spiders, despising such petty mischief, often spin a thick curtain of gossamer from the wires to the ground many miles in length in the course of a single night, and so destroy the insulation altogether and completely interrupt all communication. These instances may be put down to pure malice: but we cannot help pitying creatures which waste their valuable time in doing unconscious mischief under the influence of mistaken ideas. The Director of Telegraphs at Christiania gives us some examples of the effects of these misunderstandings. He exhibits a telegraph-pole which has had a large hole dug completely through it by woodpeckers, under the impression that the vibrations of the pole caused by those of the wires were due to the work of an insect deeply imbedded in the wood. Our pity for these well-meaning but destructive birds is increased by knowing that the pole was "Boucherized"—that is, saturated with sulphate of copper. In a card on this exhibit we are also told that bees in their search for honey often dig up the heaps of stones which are piled round the base of the poles in exposed places in the mountains, mistaking the humming noise from the pole for the buzzing of bees.

In all industrial exhibitions there is a strong tendency of the catchpenny bazaar element to develop itself, and the Commissioners of the Electrical Exhibition are to be congratulated on having reduced this pest to a minimum. It is true that mechanical pianos and sewing and embroidering machines seem at first a little out of place; but, as they are driven by electro-motors, we welcome reconciled to them as interesting illustrations of the handiness of electrical transmission of energy. We look more doubtfully on metal pens, which receive their final polish by being agitated in a tube, even though that tube be worked electrically; and though we feel the difficulty of excluding such things, we object still more strongly to one or two displays of "magnetic curative appliances." No word that we have said is intended to reflect on the electrical toys which are exhibited in the galleries, and which are worthy of all praise. Some are sets of moderately cheap miniature apparatus for illustrating and demonstrating the principal laws of electrical science, which will be found, no doubt, to "combine instruction with amusement"; indeed, some of the instruments are so well designed and made that they might be used for some purposes of original research by those whose means do not allow of their having more finished apparatus. But, we confess, the toys which most fascinated us were those designed to do something rather than to teach something. Much happiness can be got from a zoetrope worked by a small bichromate cell, and a little stamp-mill or circular saw driven by the same power would give some joy; but no one, we think, of any age could ever know care or sorrow again if he had a little screw boat which travels quite fast and for a long time when once its battery is charged and put in its place. The sight of these would be charming, but that the room in which they are is haunted by a young lady of importunate and irresistible manners, who insists on every one trying a small opera-glass in the sale of which she appears to be interested. It is in vain to say that you do not want an opera-glass. She returns to the charge, and begs you, nevertheless, to try it to oblige her, &c., until one fancies oneself back in England and undergoing the torture of a fancy bazaar. This, however, is the only instance of personal annoyance by exhibitors which we met with throughout the Exhibition.

Before leaving the subject of the bazaar element, we must express our regret at the symptoms of advertising charlatanism which we detected here and there. Of course most of the important exhibits are shown by commercial men, and their inventors are no longer responsible for the means taken to get business; but we doubt whether inflated boasts unaccompanied by any quantitative measurements taken by independent men are really advisable even from a purely commercial point of view. In one room we came upon a battery of gigantic cells, which was reported to be something very good indeed. We sought in vain for information. A printed fly-sheet spoke of one of the fluids being a "Mélange pour remplacer l'acide azotique," which was vague. However, there was the battery labelled "Pile de 50 éléments," and over it was burn-

ing a rather bright arc light, the inference being that the light was supplied by the battery. It seemed so bright with so few cells to produce it, that we examined it more closely, and found that the battery was not charged, and, therefore, that the light must be supplied from some other source of electricity. In our opinion this *suggestio falsi* is as unwarrantable as that of the man in the streets who squeaks with his lips as he lets the penny Jack-in-the-box fly up. He does not say that the toys squeak; but little boys think so, and buy them, and are disappointed. So the inventor of this battery does not say that the light is produced by his Pile de 50 éléments; but every one who has not climbed up and pulled out the stoppers thinks that it is.

It is even reported that some of the exhibitors of dynamo-electric machines have objected to submit them to the measurements which the jury desire to make of all the competing machines. We can hardly believe that any man could be so short-sighted as to take this course, which would probably be noticed in the award of the jury, and so do the invention much more harm than if it were to be placed even very low down in the order of merit. But the ways of commerce are most puzzling. We find the French newspapers full of Mr. Edison's doings. All that the influence of the press can do is being done to lead the French nation to believe that Mr. Edison has invented everything. We do not wish to disparage this ingenious American inventor; we are ready to admit that his carbon telephone transmitter, his pressure relay, and the microtasmeter are clever and more or less original inventions; and that the phonograph is perhaps the simplest and most brilliant discovery ever made in practical physics. But in duplex telegraphy, in the construction of dynamo-electric machines, and, above all, in the field of incandescent electric lighting, he has only repeated—no doubt in perfect good faith and ignorance of the work of others—the experiments and discoveries of the whole scientific world for the last twenty years or so; and yet, though Mr. Edison has, we believe, never set himself up as a worker in pure science, but only as a ready and clever inventor of commercial applications of scientific discoveries, such a passage as the following can be written and published in the Official Catalogue:—

En voyant toutes ces merveilles, on se demande quel est cet homme étonnant qui, en si peu d'années, a pu atteindre le point culminant du monde scientifique et de l'invention pratique? Son histoire ressemble à celle de Franklin et de Faraday; elle commence par lui, car il ne compte pas d'aleux.

Even though he is connected with a Company, we are rather startled to find Mr. Edison on the *point culminant* of the scientific world, and we do not think that his highest popular claim to that place—that is, the fact that he did not invent the incandescent light—is a very strong one.

However, we hope that the jury will clear away these promoters' cobwebs, and give us some facts which will be of use both practically and scientifically. The jurors have at last been elected, and the difficulty of getting seventy-five men, not of French nationality and not exhibitors, and who should nevertheless be competent persons, has been overcome, and the work of judging is advancing rapidly. Arrangements have been made for taking exact quantitative measurements in the case of dynamo and magneto machines, and it is hoped that by a judicious system of division of labour the work will soon be got through.

#### COMPARATIVE VALUE OF THE HOME AND FOREIGN MARKETS.

IN the first of his speeches at Leeds on the Fair-trade controversy, Mr. Gladstone committed a mistake which is likely to do much more harm than the elaborate statistics he afterwards produced will do good. We refer to his extraordinary and unaccountable under-estimate of the value of the foreign trade of this country. It is perhaps natural that controversialists should yield to the temptation to decry what their opponents extol too much. The Fair-traders are attaching such undue importance to the foreign trade that it is hardly surprising that Free-traders with more zeal than discretion should run into the other extreme and undervalue the importance of our commerce with other countries. But this is a temptation which Mr. Gladstone ought to be able to resist. His immediate object in the speech to which we refer was to trace to the agricultural distress the trade depression from which the country has been suffering and from which it has not yet quite recovered. In this we have no doubt he was to a very large extent right. The succession of bad harvests with which the country has been visited is manifestly the main cause of the decreased prosperity. But there was no occasion in establishing this proposition to undervalue the profits of our foreign trade, as Mr. Gladstone unquestionably did. Assuming that the foreign trade of the country in 1873 was on a sound basis, and consequently that the fall of prices which has since occurred is a loss of profit, Mr. Gladstone showed that in the three years 1878, 1879, and 1880 the loss upon the foreign trade of the country was 161 millions; in other words, if the high prices of 1873 had continued to the end of last year, the exports of British and Irish produce and manufacture would have been worth 161 millions more than, as a matter of fact, they were worth in those three years. But Mr. Gladstone goes on to observe that all this was not pure loss; that, on the contrary, the real loss was only the loss of profit in the

transactions not entered into; and this profit he estimates at no higher than 10 per cent. Consequently, he says, the real loss to the country in this falling-off of trade was only 16 millions; or, adding the loss in the carrying trade through the falling-off in the exports, which the outside was not more than 8 millions, the total loss did not exceed 24 millions.

There is a great parade of fairness in this statement, and at the same time an extraordinary misrepresentation of facts. It is quite clear, as we have often shown, that the falling-off in trade has been nothing like as great as Mr. Gladstone here assumes it to have been. The volume of trade—the actual quantity of goods sold—has decreased very little indeed. It is only prices which have fallen; and low prices, it must be borne in mind, may yield to the dealer quite as large a profit as high prices. If everybody engaged in trade has to pay high wages to his workpeople and high prices for the raw material or the unfinished goods in which he deals, the high price which he himself receives for the goods he manufactures or partly manufactures may yield him no more profit than if prices and wages were all at the level of to-day. But, passing over this for the moment, and assuming, with Mr. Gladstone, that the decrease in trade was as much as he conceives it to have been, it is quite evident that the loss of profit which he makes out is totally inadequate. In the first place, it is not a single profit which has to be allowed for, but a series of profits. Every article manufactured passes through a number of processes. Cotton and woollen, for example, have to be carded, spun, woven, bleached, dyed, and so on, and each successive manufacturer has to receive his own profit on the capital invested. Ten per cent. is clearly, then, an inadequate estimate of the profits of these various manufacturers, even if we look at profit alone. But, in addition, there are the wages to be considered. In all manufactures wages represent by far the largest part of the expenditure. And this is true of manufactures for the foreign trade quite as much as for the home trade, and it is true also in the manufacture of goods made from raw materials produced abroad. A single example will perhaps put this in a clearer light than any amount of assertion. Last year we imported raw cotton of the value of 42,765,183*l.*, but we exported again in a raw state cotton to the value of 5,466,879*l.* Roughly speaking, therefore, the raw cotton retained at home for manufacture was somewhat less than 37½ millions. But of cotton yarns we exported in the same year to the value of 11,906,126*l.*, and of cotton goods 57,678,619*l.*, being a gross total of 69½ millions. Consequently the value of the cotton manufactures which we exported last year exceeded the value of the raw cotton imported by over 32 millions, and at the same time we supplied the whole of our own population with all the cotton goods of every kind which they required. Now what was it that made this enormous addition to the value of the raw cotton we imported last year? Surely not the 10 per cent. profits which Mr. Gladstone allows, but mainly the wages paid to the operatives engaged in converting the raw cotton into cloth. Every kind of manufacture, of course, does not pass through the same number of processes and does not give employment to an equal amount of workpeople; but every manufacture does give employment to large masses of labour, and the employment of this labour is part of the benefit which a large foreign trade affords to a country. It may be said that, if the capital and labour engaged were not employed in the foreign trade, they would find occupation in producing something else for the home trade. But that is a mere assumption. As a matter of fact, we find that all commercial countries have a large foreign trade, and that the richer and more advanced they are the larger their foreign trade becomes. But, without going into that point, it is enough to say that, when we find great masses of capital and labour engaged in any trade, the fair inference is that that trade is more profitable than any other to which the capital and labour could be diverted. It is not easy to see how Mr. Gladstone came to overlook this important part of the question with which he was dealing; but it is to be regretted that he gave currency to so mistaken a view of the subject, for his error in this matter is likely to throw discredit upon his whole argument, and to help the Fair-trade advocates more than any argument on their own part. It is the more to be regretted too, because his argument really did not require the mistaken view which he put forward. It was quite possible for him to prove that the depression in trade was greatly aggravated, if not mainly caused, by the succession of bad harvests, without in the least under-estimating the importance of the foreign market; and, moreover, it is easy to show that the home trade is really of much more importance to the country than the foreign trade, if that was his object.

If we look at the matter impartially, we shall see that the home trade, in the nature of the case, must be more valuable than the foreign trade. We have here closely packed together in these islands 32 millions of the richest and most energetic people in the world—a people, too, who are as eager in their spending of money as they are in the making of it. It is natural to suppose that this population gives a larger employment to the traders who form part of it than can be given by scattered and unimportant minorities of foreign populations. And this natural supposition is confirmed by all the facts that we can collect. Unfortunately, we have no statistics of the home trade such as the Board of Trade Returns furnish of the foreign trade; but various considerations will bear out what we are saying. In his paper on recent accumulations of capital, Mr. Giffen estimates the savings of the United Kingdom between 1865 and 1875 at 240 millions a year. If this be

correct, the mere savings were equal to the whole of the exports of British and Irish produce and manufactures; and however largely we may estimate the profits of the foreign trade, both to the workpeople employed and to the capitalist, it is evident that the savings from this trade must have been quite insignificant compared with the total savings just mentioned. Consequently, these savings must have been drawn mainly from the home trade. Again, it is estimated by Mr. Caird that the agricultural produce of the United Kingdom is of the value of about 260 millions a year. In this, of course, is included the value of all kinds of agricultural produce—corn, green crops, hay, cattle, and so on. According to Mr. Caird, then, a single trade, even though it be the largest of British trades, yet one which is carried on exclusively for home consumption, and which gives employment to but a small minority of the population of the United Kingdom, yields a larger return than the whole of the exports of British and Irish produce and manufactures. It is true, no doubt, that of the agricultural production a portion is consumed by the agricultural population itself. But even of what is consumed on the farm, a large proportion goes to raise some other kind of agricultural produce more valuable than that which is so consumed. For instance, the grass, hay, turnips, mangolds, and so on, consumed by cattle are consumed for the purpose of fattening those cattle, or of producing milk and butter for the market. Further, the railways of the United Kingdom earned a gross income last year of very nearly 62 millions sterling; and in addition to the railways there were tramways, omnibuses, coaches, hackney carriages, and steamboats employed in locomotion. The mineral production of the United Kingdom last year was over 64½ millions. We have no means of ascertaining the value of the mass of trades, but it must be immense, and the great majority are exclusively home industries. The building trade is so, for instance, and even iron, coal, and the textile trades, though furnishing large contingents for export, have yet probably a still more valuable home connexion. This is certainly true of coal—the consumption in our own manufactories, upon our railways, and in our houses being vastly greater than the quantity exported. It is true doubtless also of iron, and we make no doubt that it is also true even of cotton. It does not seem, then, an exaggeration to say that the home trade is really several times more valuable than the foreign trade. No economist, in short, who has given attention to the subject will for a moment doubt that the home trade is incomparably the more valuable of the two; but it does not follow therefore, and it serves no good purpose to imply, that the foreign trade is unimportant. Because an unwise cry for Protection is raised, that is no reason why sensible men should deny the very great importance of the foreign trade.

As we have shown above, the foreign trade gives employment to British capital and British labour; but in addition it also enables us to pay for the imports which are increasing year by year. From the point of view of national comfort, no doubt, the imports are more important than the exports. The imports we buy because we need more food than we raise at home, and because we desire to have comforts, conveniences, and luxuries which our own climate will not produce, or which, for one reason or another, are produced in greater perfection abroad than at home. And we pay for these imports mainly by means of our exports. It is possible to conceive that we might pay for the imports by means of services rendered, as, for example, by the carrying trade, and by means of the large income derived from foreign investments. But neither the carrying trade nor our foreign investments are at present sufficiently large to pay for the imports we require, and, according to all probability, they never will be so. It must always be mainly by means of exports proper—that is, the exports of commodities—that we shall pay for our imports; and therefore, even looking merely to the imports, it is desirable that the exports should be maintained large. Besides, a large export trade gives us advantages of various kinds. It makes us acquainted with all the markets of the world, and enables us to buy what we require cheapest and best. Indeed one of the follies committed by Protectionists is that, in their anxiety to maintain a home market for native industry, they shut themselves out from the foreign markets of the world, and render themselves less able to obtain the imports which they require.

#### NEWMARKET SECOND OCTOBER MEETING.

THE opening of the Second October Meeting was a great contrast to that of the First. Instead of soft, warm, summer-like weather there was a piercing north-easterly wind, the sky was cloudy, and the atmosphere damp and chilly. Nor was the racing on the first day good enough to make up for the deficiencies of the weather. The sport began with a Post Produce Stakes for two-year-olds, for which only four started; and for once in a way as much as 5 to 1 was laid against Archer's mount. Fordham was riding the favourite, a filly belonging to Mr. Crawford, but Archer brought up Lord Falmouth's Darnaway in the last hundred yards, and won by a length. The favourite for the Cesarewitch Trial Handicap was Sir John Astley's Windsor, the winner of the last Chester Cup. The race was run over the severe Cesarewitch course, and when Windsor came out at the T.Y.C. post he seemed to be winning, but the long distance had been too much for him, and Gladstone caught him in the last fifty yards and won by three-quarters of a length. Either the field for

the Chester Cup must have been a bad one, or Windsor must have fallen off terribly since May. In the Clearwell Stakes Dutch Oven had to meet Nellie once more. We have described the former races between these two famous fillies in previous articles. As much as 3 to 1 was laid on Dutch Oven, and 9 to 2 was laid against Nellie. Archer rode the former, and Fordham the latter. Although Dutch Oven was giving Nellie 3 lbs., the long odds laid on her seemed justified by previous running. The only thing to be said against them was that at York, where Nellie beat Dutch Oven when receiving 7 lbs., the ground had been deep; and now again the course was just a trifle heavy for a filly with such low sweeping action as Dutch Oven. As it turned out, the layers on Dutch Oven had a good fright for their pains. When the horses came up to the cords the two favourites were racing hard against each other, and Dutch Oven was evidently very hard pressed, if not absolutely beaten. The two crack jockeys were exerting all their skill as they raced up to the winning-post, with their horses running neck and neck. Dutch Oven managed just to win by a short head, but it was a narrow escape. Lord Falmouth has been very fortunate in the Clearwell Stakes, as he had previously won it with Bal Gal, Jannette, Silvio, Farnese, and other horses. Wood, who is a very rising jockey, won the next race on Sir J. Astley's Warren Hastings, the first favourite, Strathavon, ridden by Archer, being third. At the First October Meeting Wood had been very successful, beginning the meeting by winning three races in succession.

On the second day the Cesarewitch engrossed all attention, and but little interest was taken in the rest of the racing. Archer rode the winners of four out of the seven races of the day; but in each case he was riding the first favourite. It is only fair to say that when there is not much to choose between the starters, his mount is generally made the first favourite from the simple fact that it will have the advantage of his jockeyship. He rode a very fine race in the first event of the day, waiting patiently on Angelina as far as the Dip, and then coming with one resolute rush up to the winning-post, which he reached three-quarters of a length in front of Kubleborn. In the Burwell Stakes, Archer had to exert all his skill on Golden Eye to catch Groves on an unbacked outsider belonging to Count Lagrange, called Davy Jones—a horse that has run in a dozen races without winning one. Archer brought up Golden Eye with one of his most scientific rushes; but Jones rushed too, and although Golden Eye won, it was by so short a head that her backers must have felt far from comfortable until they saw her number put up. To turn from the riding of perhaps the most celebrated jockey in the world to that of ten jockeys who had never won a race, we may notice the Maiden Rider's Plate. There was in this case no dashing up at the last moment and winning by a short head on the post. A long way from home one of the lads brought his horse right away from his opponents, and, never being caught again, he won by half a dozen lengths. Fiddler, who had run third in the Cesarewitch, making the running during an important part of the race, was brought out again shortly afterwards for the Royal Stakes. Although he had had a severe race in one of the fastest Cesarewitches ever known, and had now to run over a course a mile and a quarter in length, he made his own running and won in a canter by four lengths. We described the Cesarewitch last week. As a spectacle, it was a singularly dull affair to those who had not studied the antecedents of the competitors.

It cannot be denied that the Middle Park Plate is a very interesting race; but it must be allowed that it has scarcely turned out such a success as its founders anticipated. To begin with, it has not proved by any means an infallible guide to the Derby, which was one of the objects for which it was supposed to have been instituted. Secondly, it has not maintained its popularity among owners of racehorses, the number of subscribers having decreased, until, on the late occasion, they were reduced to 126. The year the race was first started there were 186 subscribers, and the value of the stakes was 4,840*l*. This year the value of the race was only 2,817*l*. In 1875, thirty horses started for it, but this year only thirteen ran, which was the smallest field that ever came out for the race. The favourite was Lord Rosebery's Kermesse, a filly that had won every race for which she had started, with the exception of the Richmond Stakes at Goodwood, when she was a head behind Dutch Oven. In that race, however, she had given 4 lbs. to her conqueror, and subsequently, in the Champagne Stakes at Doncaster, she had beaten Dutch Oven by half a length at even weights. In the July Stakes Marden had run within half a length of her, and as he was now to be ridden by Archer he was made second favourite. Soon after the start Kermesse went to the front, and, piloting her field at a fast pace, she led them up to the winning-post, finishing without effort a length in front of the nearest of her rivals. The second in the race was an American horse called Gerald, belonging to Mr. Lorillard, the owner of Iroquois, the winner of the Derby. Gerald has only been a few weeks in England, and is said to have been troubled with a cough since his arrival. He is a very good-looking colt, with plenty of size and length, but he is at present deficient in muscle, and looks unfurnished. If he thickens out into a powerful horse, he may rival the performances of Iroquois and Foxhall next year, and it must be remembered that the form he showed in the Middle Park Plate was very good for an unfurnished colt. It would add greatly to the interest of next year's Derby if a good American horse were again to be among the favourites. Kermesse is neither entered for the Derby nor the

Two Thousand, but she is in the One Thousand, the Oaks, and the St. Leger. There was a very fine race after the Middle Park Plate for a Hundred-pound Selling Stakes, and the battle was fought out between Archer and Wood. Against a worse jockey than Wood, Archer would probably have won, but Wood held his own with very great judgment and resolution, winning by half a length after a capital race. Wood also won the Flying Welter Handicap very cleverly with the outsider Althotas, David Jones, who had given Archer so much trouble the day before, being second. Foxhall, the winner of the Cesarewitch, won the Select Stakes in a canter, beating Tristan, to whom he was giving 5 lbs., by three-quarters of a length. According to this form he must have improved considerably since June, as he only beat Tristan by a head at even weights in the Grand Prix de Paris.

In some respects, the most interesting day of the meeting was the Thursday, for then the winners of the Derby of this year and last year were to meet at weight for age in the Champion Stakes. Last year Bend Or and Robert the Devil, the winners of the Derby and the St. Leger, had met in this race, when Robert the Devil had won by ten lengths, and now Bend Or and Iroquois were to fight out the dispute as to the relative merits of the three-year-olds and four-year-olds of the current season. Bend Or won the race by three-quarters of a length after a hardish struggle; but the opponent that he had some difficulty in shaking off was not Iroquois, the winner of the Derby, but Scobell, who had been far behind Iroquois in the Two Thousand, the Derby, and the St. Leger. The complete reversal of public form appears to be the special delight of the capricious Scobell, and it seems impossible before any race to foretell how well or how badly he may run. Iroquois was beaten at the Bushes, and his running is quite incomprehensible when his previous public form is taken into consideration. At any rate the Americans are likely to be of this opinion, for it is reported that after this race they had to refund to the Britishers a large portion of their winnings on the Cesarewitch. Bend Or has evidently had something the matter with one of his fore-legs, for even through the bandage which he wore it was perceived that he had an enlargement of the suspensory ligaments. Archer had to press him to his best pace from the Bushes, and if he had not ridden him with great perseverance and resolution down the hill, and up from the Dip to the winning-post, it is probable that Scobell might have beaten him. The question still remains whether Bend Or could have beaten Foxhall if he had been started. It is quite impossible to decide this point; for if Iroquois's running with Bend Or was correct, Foxhall could have had but a small chance, and yet, on the previous running of Scobell and Foxhall, Foxhall ought to have beaten Bend Or easily. Another interesting race was the Queen's Plate, in which Chippendale and Petronel met at even weights over two miles. It turned out to be a fine thing between the pair, but Petronel ran with far more gameness than his adversary, and won by three-quarters of a length. The Corrie filly, who, after being one of the leading favourites for the Cesarewitch, had been scratched three hours before the race, was the first favourite for the Newmarket Oaks. We noticed last week that she had slipped up a few days before the race, and traces of her accident still remained in a pair of broken knees. She did not gallop, however, as if any evil had resulted from her fall, but she is scarcely a fine specimen of a race-horse, and she was beaten by a head, after a hard struggle, by Perplexité, a filly that had been unplaced in the Epsom Oaks. Fordham was riding the Corrie filly, but he made up for his disappointment by winning three races later in the day.

On the last day of the meeting, Iroquois won the Newmarket Derby in a common canter, beating Ishmael with the greatest ease, though by only three-quarters of a length. After his running with Bend Or in the Champion Stakes, Scobell had every claim to be the favourite for the Fourth Great Challenge Stakes. The ill-tempered Peter went down to the start, but, after making himself as disagreeable as possible, he was left many lengths behind when the field got fairly away. Tristan made the running, but at the bushes Scobell took the lead, and maintained it as far as the ascent out of the Dip, where the two-year-old Nellie came to the front and beat him easily by three-quarters of a length. If Scobell's running in both the Champion Stakes and the Challenge Stakes was correct, it would appear that the three-year-olds of the year must be below the average, but that the two-year-olds are exceptionally good, for if Nellie could beat Scobell so easily, what must Dutch Oven, Kermesse, and Geheimniss be? Throughout the week, Newmarket Heath was swept by a cold wind, and on the Friday there was a violent hurricane, though very little rain fell during the racing.

## REVIEWS.

SIR THOMAS MUNRO.\*

SIR THOMAS MUNRO went out to India as a cadet in the Madras army in 1780, and died Governor of that Presidency, after a sharp attack of cholera, in July 1826. The editor of these

\* Major-General Sir Thomas Munro, Bart., K.C.B., Governor of Madras. *Selections from his Minutes and other Official Writings*. Edited, with an Introductory Memoir and Notes, by Sir Alexander J. Arbuthnot, K.C.S.I., C.I.E. 2 vols. London: C. Kegan Paul & Co. 1881.

Minutes reached India only about fifteen years after Munro's death, and served with distinction in the Civil Service in various high offices, including the post of member of Council at Madras and member of the Council of the Viceroy, for more than thirty years. The period embraced by the Memoir, the Minutes, and the personal experience of the editor, extends consequently to nearly a century. Few persons, from training and opportunity, could be more competent than Sir Alexander Arbuthnot to give a concise summary of Munro's life and services, or to select from his copious writings such portions as might instruct the ignorant, rebuke the presumptuous, and encourage the diligent student of Indian affairs. We do not mean to say that any large number of educated Englishmen will care to study the Ryotwari system of Madras. But we do say that, as explained in these pages, it is much more satisfactory and easier reading than three-fifths of the speeches on the Irish Land Bill; and though the purpose of the editor was not to give us an insight into the details of the Madras administration as distinct from that of Bengal, Agra, or the Punjab, any one who gives due diligence to these two volumes will acquire a fund of knowledge about the assessment of the revenue, the cultivation of wet and dry land, the defects of irrigation, the relative position of a principal Collector and his Sub-Collector, the functions of a Potail or head of a village, the rights of individuals in property, such as they were under native Governments, and a hundred other matters, which, in dealing with Oriental questions, are usually deemed essential to the formation of any conclusion at all. The book is well got up; the errors in printing are infinitesimal; there is much to be said in praise of the table of contents and the index; but why, as in so many other cases, have we to notice the want of a good map? Munro's Minutes and towns teem with geographical notices, and not every Anglo-Indian official can carry in his head the relative positions of such places as Salem and Bellari.

The memoir, which fills about two hundred pages, is a judicious condensation of Mr. Gleig's Life of Munro, set off by additional information collected by the editor in a long career in various departments. The leading facts of the life can be stated summarily. Munro served long enough under his namesake Sir Hector Munro and Sir Eyre Coote, between 1780 and 1792, to see a great deal of active warfare and to acquire a very good knowledge of military affairs. Readers of Wellington's despatches may remember that Munro's friendly criticisms about the strategy at Assaye procured him the honour of a detailed justification of his plan of attack from the great captain. But Munro's talents were developed, like those of Thomson, John Lawrence, and others, in the "Settlement" of our new acquisitions. In the Baramahal, in Southern Canara, in the ceded districts—comprising Bellari, Cuddapah, and Kurnool—he planned and carried out the revenue Settlement which is the mainspring of civil society in the East. He spoke Telugu and Canarese fluently, and, we apprehend, must have picked up a little Tamil. He became a proficient in Urdu and Persian. Few men, if any, ever surpassed him in familiarity with village and agricultural life. In 1807, after years of valuable work and exposure in camp, he returned to England, and remained long enough to give useful evidence before the House of Commons in 1813. In 1814 he went back to India, after a marriage which proved singularly happy, to be employed on a Judicial Commission; a duty in which he met with opposition from sundry antiquated officials, who were convinced that everything was in the best possible state. From this he was removed, at his own request, to an independent military command during the Mahratta campaign of 1817-18, and proved, to quote the words of Canning, that the "accomplished statesman" was also at need "the skilful soldier." In 1820 he was appointed to the Governorship of Madras, and for more than six years was occupied both in actively governing the country and people, and in devising plans of reform which have facilitated the task of government for his successors. The memoir embodying these results may be read with advantage by those who do not care to ascertain more precisely the humble functions of a *Curnum*, or the enormous responsibility of a Collector-Magistrate who has to realize punctually thirty lacs of revenue and to rule and content two millions of people.

English politicians, in these troublous days, are wont to appeal to the speeches of deceased orators and statesmen; to ask how Canning would have acted, how Palmerston would have written on the Græco-Turkish question; what Peel and Huskisson would have now thought of free-trade, or how "Lord John" would have defined the balance of Continental Power. Minutes represent the speeches of such Anglo-Indians as Malcolm and Munro. Let us now see what our soldier-civilian thought of many of those questions which were not fathomed to their depth by the genius of Dalhousie or irradiated by the serene intellect of Canning. No arrangement can be better than the editor's division of the Minutes into Revenue, Judicial, Military, Political, and Miscellaneous. Revenue was Munro's strong, perhaps his strongest, point. He had all the details at his fingers' ends. No obtuse or ignorant civilian could blunder and escape the keen eye of the Governor; none so able and experienced but could benefit by his criticisms and suggestions. In Minutes at Council as in earlier letters to the Revenue Board, Munro enlarges on the merits of the Ryotwari system, and removes sundry false notions as to its principles, intent, and operation. It ought not to be a variable yearly assessment of what each tenant is to pay. On the contrary, the assessment must be light, and be fixed for a term of years. There are to be no extra charges on the more valuable kinds of produce. Rice is to be assessed at the same rate as tobacco, and pine-apples

are to pay no more than *jowari*, a sort of millet. There may be a small extra charge for irrigation if this want is supplied by Government; but a Ryot will pay either the same, or more, or less, in any one year, according as he cultivates an equal, a larger, or a smaller portion of land. He may take a plot in addition one year and throw it up in the next; but his rate for the land he actually occupies and cultivates will not vary. All the improvements are to be his. The duty of the collector, in the annual tour of inspection, will be to inspect the *Curnum's* accounts, to talk to the head men, to record new lands taken up as well as old lands thrown out of cultivation, to see that the village officials do their work without cheating the Government or oppressing the tenants, to encourage Ryots to make ordinary repairs to tanks and water-courses, and to leave behind him a population impressed with that sense of security of tenure and "fair rent" which is the foundation of all obedience and loyalty to the Government. In fact, some of Munro's Minutes on Revenue, written seventy years ago, might be applicable to a very visionary Ireland where cattle are not mutilated, nor agents shot, and where all dues are paid. All that Munro laid down on the Ryotwari system is sound, if we prefer that system to the village coparcenary tenure or to the Talookdari. That in the hands of competent officials it is worked with smoothness, ease, and benefit to the people, there can be no sort of doubt. Probably in several respects the tenant-proprietor of Bellari or Cuddapah is fully as well off as the *putidar* of the North-West Provinces, and better than the *jotedar* of Lower Bengal. But, with all its abuses and defects, the value of the Zemindary system has been tested and found to answer in famine and rebellion. The village system of the North-West Provinces collapsed at once on the withdrawal of British authority. The anarchy threatened by sepoys in Dacca, Chittagong, and even Behar, dwindled away before the impulsive, not to say the loyal, behaviour of several of the great Bengal Zemindars. We think, too, that Munro occasionally underrated the advantage of having a class of large proprietors between the Government and the cultivating community, who by association, wealth, and privilege should be enlisted on the side of law and order. But Munro perhaps knew a little too much of the proclivities of big Mohammedan rent-collectors and of ignorant and oppressive Rajas, and, as was natural, his sympathies were all with the Ryots, who had crowded to his tents, and for years afterwards exhibited the leases of the Colonel *Dora* [Sahib] as the strongest and surest of their title-deeds.

We pass from these boundless subjects of tenures, taxation, and revenue systems, to the employment of the natives. Here Munro was a long way in advance of his age. He dwells on the political as well as the pecuniary reasons for employing natives in higher posts. It is absurd, he argues, to give a high literary or scientific education to people who are debarred from all honour and public employment. We cannot perpetuate the degradation of a whole community by refusing them all share in the government of themselves. We must give them a fair chance. These generous sentiments, which are expressed in noble and almost eloquent language, derive still more force and support from the absence of all cant. Munro never hazards the opinion that "representative institutions" would grow like cabbages and would be a preventive against Indian famines, or that we are to look hopefully forward to the day when we may betake ourselves to our ships and leave the natives to govern themselves. On the contrary we are never to consider India as a "temporary possession;" "our sovereignty should be prolonged to the remotest possible period," and the natives are to be "employed consistently with the due preservation of European control." In short Munro's views were liberal, humane, but severely practical. He had no store of pet projects or grandiloquent phrases, and his Minutes hit the just mean between sanguine belief and undue depreciation where the Hindu or Mussulman character was concerned.

In the government of the civil and military servants of the Presidency, as well as in the management of colleagues who might have been jealous of his elevation, he seems to have been very successful; and there is an instructive episode of a case of an *inam* or grant of land to a native of rank, which was brought before the Supreme Court of Madras and decided by the Chief Justice adversely to the view entertained by the Executive Government. The Court decided practically that it had jurisdiction in matters of Public Revenue, and that it had a right to interfere in what was substantially an important political act. Munro, in a masterly argument, showed that the Court was acting wholly without jurisdiction and *ultra vires*; and he exposed the confused, rambling, and hazy reasoning of the English lawyer at the head of the Court about Crown lands, Queen Anne's Government, and *prim. et quint. Eliz.* The error was set right by an appeal to the Privy Council; but this is not the only instance in the annals of British administration where a barrister-judge, brought up mainly on Tidd's Practice and Chitty's Pleadings, has perversely tried to encroach on the legitimate functions and rights of the Executive Government, and has met with a rebuff in consequence.

Munro's general character for sagacity will not perhaps be impaired by his evident inability to conceive such a famine as that which desolated the Madras Presidency fifty years after his death. He never apprehended two bad years in succession, or thought that famine on a vast scale was possible save in conjunction with war. But many of his recommendations to mitigate scarcity or partial famine would have been as applicable in 1877 as in 1854; the importation of grain on a large scale, the remission of assessment, the employment of the poor and destitute in repairs of roads and wells near their own villages, and the in-

appropriateness of wholesale relief gratis by Government. Had Munro lived to see a mutiny, to which contingency he was by no means blind, he might not have disapproved as he did of the disarming of the people. In his day the inhabitants of the Ceded Districts had troublesome neighbours in Mysore and the territories of the Nizam and the Peshwa, but he was quite prepared to pay a moderate price for the surrender of weapons on the part of those who had no occasion to use them. Very likely his remarks on the dangers of a free and unrestricted press will cause a shudder to sensitive Radicals. He shows clearly that unbridled discussion is not good even for the natives themselves, and he anticipates many of the reasons which led the Government of Lord Lytton, supported by the opinions of the most experienced administrators, to impose a moderate and wise restraint on spite, disloyalty, and malevolence, disguised under the sham names of free and wholesome writing. The Minutes on the conduct of the first Burmese war tend to show that the proper place of the Governor of Madras would have been in the Council Chamber of Calcutta. Munro at Madras could but suggest, and was only called on to aid military operations in Pegu by the despatch of additional troops and by supplying stores and bullocks. His opinion was never formally asked about the conduct and object of the campaign, but it is obvious that Lord Amherst would have been a good deal the better for a conference with a man who could argue forcibly on the impolicy of commencing a war in the delta of the Irrawaddy with an inadequate force, or of feeding English soldiers on salt meat in such a latitude as Rangoon. In forecasting the conditions under which peace should be made, it did not escape him that the key to Upper Burma and Amarapura was the possession of the kingdom of Pegu. Munro would have accomplished this aim by restoring the old kingdom of the Talains. Lord Dalhousie settled the matter, a quarter of a century later, by making Pegu a British possession; and at this moment there is no part of our possessions in which reasonable progress is more combined with the loyalty and the contentment of the community. The Minutes, as might be expected, abound with hints and maxims profitable to administrators in every stage of their career. Gentlemen in the Educational Department are not to claim a monopoly of the appointments to the lowest class of native judges, on the ground of their having obtained certain college certificates. Magistrates, as was remarked some few years ago by Lord Salisbury, on a case of riot, to the Government of Bombay, are bound to preserve the public peace in a dispute between right-hand and left-hand castes claiming to use flags and palanquins in public processions. No campaign will be well conducted without an efficient and well supplied bazaar. A military Board of three quarrelsome members is extremely ill-adapted to control a Commissariat. A collector should have no money dealings of any kind whatever with any Zemindar or "other inhabitant" within his jurisdiction. Grants of land rent-free in perpetuity are objectionable. A term of three lives is ample, and this was the principle mainly adopted in disposing of this difficult subject after the annexation of the Punjab. A previous training in the Revenue Department is a valuable qualification for judicial office. Not only should a young man see the natives under other aspects than those of irritated litigants, but, in order to decide civil suits about real property, a judge should know something about the partition and management of estates, the conditions of agriculture, the payment of revenue, and the pleas on which rent is increased by one party or withheld by another.

Sir Alexander Arbuthnot draws a parallel between Munro and Elphinstone, Metcalfe, and Malcolm, and endeavours to fix the exact place of the former in the catalogue of Indian statesmen. Less erudite than Elphinstone, less genial than Malcolm, and less successful than Metcalfe in reaching an eminence which only two other civilians have attained, Munro in many respects was equal to either of the three. He never was entrusted with difficult diplomatic negotiations. He had never to advise, restrain, and encourage proud Rajput and Mahratta chieftains; and, like Meadows Taylor, he does not appear to have come under the special notice and commendation of the statesmen who filled the office of Governor-General from Lord Cornwallis to Lord Hastings. His career, too, was passed exclusively in Southern India, in which public interest was less excited after the capture of Seringapatam. It was not his fate to forecast Russian advances or Sikh aggrandisement. But we doubt if he was ever excelled, save by one or two eminent Bengal civilians, in intimate knowledge of the wants, character, and temperament of the natives; and these two volumes do no more than justice to his rare talents for military warfare and civil administration, to his political foresight and capacity, to his power of influencing bodies of natives, and to the simplicity, dignity, and worth of his private character.

#### THE ANTIQUARY.\*

IF we were disposed to find fault with *The Antiquary* it would be chiefly on account of the bewildering multiplicity of its topics and the want of system in their arrangement. Opening the present volume at random we find "A Walk Round St. Paul's in 1501" prefixed to "The Pedigree of Shelley," which is followed by "Antiquarian Notes on the British Dog," and "The First

Spinning Jenny." We are then suddenly introduced to "Some New Facts respecting the Chevalier d'Eon," and to the "Remains of the London Wall near the Minorities." Having done with the Minorities, we come to "Our Colonies under the Merry Monarch," with a history of "The Wedding Ring," and a disquisition on "The Romant of the Rose." We are then taken on an "Archæological Tour in Norfolk," in which the interest of Oastle Acre is despatched in fourteen short lines; when, having gone through an "Exhibition of the Old Masters," we stop at a review of "A Guide to the Study of Book-plates," which is succeeded by numberless short notes, more or less on antiquarian subjects. Instead of being reminded of Cheapside, where we can find an inexhaustible supply of whatever things we want, whether snow-white lawn or perfumed gloves, amber necklaces or bugle bracelets, and in as attractive display as the wares offered by Autolykus, we seem to be taken into the general shop of a country village, where we can get much of nothing, but a little of everything, though not perhaps of the best quality. Every one, it is true, has not at all times an opportunity of dealing in Cheapside, so he may be grateful for the accommodation of the country store, but he defers his larger purchases till a more convenient season. In the same way, we must take the papers here rather as samples of their kind, and go to more copious sources for fuller information on the subjects treated of. That short articles should appear in a periodical like the present is unavoidable, and even to be desired; but it might also be well that a more extensive dealing with special matters should likewise be attempted. For instance, the opening paper in the volume before us is on the "Roman Villa near Brading," by Mr. Cornelius Nicholson, and is an intelligent account of that interesting discovery. Quite apart from this particular contribution, which is complete in itself, a series of papers on the remains of Roman villas in Britain would help towards so sufficient an education on their subject that the consideration of some new disinterment, like the one just mentioned, would serve as a profitable illustration of the general plan of those remarkable works. It would be absurd to expect every branch of archæology to be thoroughly explained in a popular antiquarian magazine, and there are treatises and handbooks in which a learner may find most of the information he needs. But the business of a publication such as *The Antiquary* should be to educate its readers, as well as to supply a mere collection of papers that, beginning and ending in themselves, leave but little impression upon the mind.

Among larger subjects that might reasonably have here a foremost place, and that would help to give the work a permanent value, is conventual arrangement. Except Canon Venables's excellent article on Abbeys in the current edition of *The Encyclopedia Britannica*, we know of no English work where distinctive plans of the houses of the various religious orders are satisfactorily discriminated. We are not forgetful of the late Precentor Walcott's several volumes on monastic matters, but he is on many points by no means a final authority; and it would be too much to expect that he should be so, seeing how immature is the knowledge that has as yet been acquired on the extensive range of topics involved in the study of monastic construction. A succession of papers in which each class of abbey and priory—Benedictine, Cistercian, Cluniac, Carthusian, Augustinian, Gilbertine, and others, not forgetting the houses of the four orders of friars, of the Knights Templars, and of the Knights of St. John—should be carefully defined, or at least discussed, and compared with existing or historical remains, would be of invaluable service to the student. A religious house of old, in its architectural plan, was not a mere accidental accommodation to the wants of its inmates, but was a symbol of their rule of life, and expressed the nature of their discipline. Not only each apartment, but every door, window, pillar, arch, recess, moulding, and niche had a purpose, and was alive with meaning, while the historical changes of architectural plan showed a corresponding alteration of practice. In secular life a man may change his morals or religion without transforming his abode, but when the Cistercians introduced painted glass, heraldic pavements, carved imagery, and other features forbidden by the Rule, their buildings became the exponent of modifications of their own discipline. As it is, each number of *The Antiquary* is usually complete in itself, and is fitter for those who run and read than for such as sit down and study. "I'd give 'em a coorse; there's nothing like a coorse in our connexion," says Mr. Tozer in *Salem Chapel* to the new minister; "I'd touch 'em up in the State Church line, Mr. Vincent, if I was you. Give us a coorse upon the anomalies, and that sort of thing—the bishops in their palaces, and the fishermen as was the start of it all; there's a deal to be done in that way. It always tells." With some variation of topic, Tozer's advice might be made to tell in a periodical such as the one before us; a comprehensive dealing with a single subject would give character to a whole volume, while space would still be afforded for miscellaneous articles.

Turning to the special papers, we are attracted to "Some Traditions and Superstitions connected with Buildings," by Mr. G. L. Gomme, which seems to suggest sombre memories of feudal castles and lonely granges, where ghosts in armour clank up and down the long corridors, or ladies in white pass before the windows—a theme which has been fearfully and wonderfully rehearsed by Mrs. Radcliffe and Mrs. Crowe. Mr. Gomme, however, has nothing to say about spectres and goblins, though these might have infested the blood-stained buildings he mentions as appropriately as any of their usual haunts. At first sight nothing

\* *The Antiquary*: a Magazine devoted to the Study of the Past. Vol. III. London: Elliot Stock. 1881.

seems to confirm the philosophic opinion of the madness of human kind more than the strange customs and wild superstitions which are to be found in more or less degree amongst all people, whether savage or civilized. But it is easy to see that whereas in cases of individual unsoundness the imagination takes possession of the reason and produces extravagance of conduct, the irrational customs of communities are owing simply to the joint working out of distinct feelings and passions with a view to some intelligible end. When the dread of the supernatural, and a desire to propitiate unseen powers, combine with instinctive cruelty, we find such practices as are said to have been common among the Milanese, where in the deep hole which had been dug to receive the post of the largest house a slave girl was placed; when, the lashings by which the heavy timber was suspended over the excavation being suddenly cut, the victim was crushed to death, a sacrifice to the spirits. Many like instances of buildings being founded in blood are related in the same paper in connexion with such wide-apart places as Galam in West Africa, Japan, the Punjab, Polynesia, and even Great Britain, and the list might have been extended had the writer further used the researches of Dr. Tylor, whom he quotes. Even the Christian religion itself, and no less a saint than Columba, are represented to have sanctioned the horrid custom. There is a legend that when Columba began to build on Iona, the walls by some invisible agency fell down as fast as they were erected. It was then supernaturally revealed to the saint that a human being must be buried alive in order to ensure the foundation. According to one account, Oran, the companion of Columba, willingly devoted himself and was interred accordingly, while some pretend that he became a compulsory victim. At the end of three days, however, Columba had the curiosity to take a farewell look of his old friend, and ordered the earth to be removed. Oran raised his swimming eyes and said, "There is no wonder in death, and hell is not as it is said to be." The saint was so shocked at this impiety that he instantly ordered the earth to be cast in again, uttering the words, "Uir! Uir! air beal Orain ma'n labhair e tuile comb'radh"—that is, "Earth! earth! on the mouth of Oran that he may blab no more." Happily for the fame of St. Columba there is no more occasion to accept the truth of the story than of the similar one concerning Merlin, who managed sagaciously to escape his doom. Neither tale need, at any rate, be more seriously credited than the more familiar legend of the assassination of Remus for leaping over the ditch of his brother's pomerium, which seems in some sort an anticipation of the same barbarous rite. There is no doubt, however, of the wide prevalence of the fierce superstition which such stories illustrate.

Mr. Jones's well-known work on *Finger-Ring Lore*, together with a series of papers on "Old Rings" which appeared in the fifty-third volume of *Fraser's Magazine*, might almost have saved the necessity for the two short articles here given on "The Wedding Ring." The subject, however, involves so much historical anecdote, and affords such opportunity for selection of curious particulars, that a fresh handling of it can rarely come amiss. The literature of poetry and romance is fertile in references to the betrothal and the wedding ring. The German ballad of "The Noble Moringer," as translated by Sir Walter Scott, is a ready instance, where the hero returns from the Holy Land after many years' pilgrimage, and in the disguise of a palmer enters his castle on the eve of his wife's nuptials with another knight. The lady hospitably sends the pilgrim a cup of wine. Into this he drops his ring, and sends it back to the lady with a request that she will empty the cup herself. She does so:—

The ring hath caught the lady's eye, she views it close and near;  
Then might you hear her shriek aloud, "The Moringer is here!"  
Then might you see her start from seat, while tears in torrents fell;  
But whether 'twas from joy or woe the ladies best can tell.

The writer remarks that the early history of the wedding ring can hardly be separated from that of the betrothal ring, which was formerly the more important of the two. Breach of contract is now but a civil business, but in times of violence and unrestrained passion the Church threw its protecting arms round the woman by sanctifying the espousals and punishing the betrayer of his engagement by excommunication. Marriage itself, however, was, according to Blackstone (i. 439), first declared an ecclesiastical contract by Pope Innocent III. (A.D. 1198), who ordered that weddings should be celebrated by the Church, and further hallowed the marriage vow by making it sacramental. In the Greek and Roman Churches the thumb and first two fingers were symbolical of the Holy Trinity, and in the ancient ritual of marriage the ring was placed on the top of the left hand thumb of the bride with the words "In the name of the Father"; on the next finger, saying, "and of the Son"; on the third, adding, "and of the Holy Ghost"; and on the fourth with the closing word "Amen." The invocation after leaving the ring loses much of its point in our Common Prayer by the omission of the words in italics—"That as Isaac and Rebecca, after bracelets and jewels of gold given of one to the other for tokens of their matrimony, lived faithfully together, so these persons may surely perform and keep the vow and covenant betwixt them made, whereof this Ring given and received is a token and pledge"; but the words are to be found in the first Prayer Book of Edward VI. Queen Mary decided not to be married to Philip of Spain with a decorated ring, but "with a plain hoop of gold, like other maidens," which was laid, in what might seem very unpoetical fashion, on the Bible. Oddly enough, Martin Luther's ring might have suited a sister whom white virgins had adorned as the consecrated bride of

Christ, rather than a nun who had renounced her convent vow for a man who also had revoked his vow of celibacy, and lifted his hand against the Pope and all his works. Combined with a carved crucifix was a group of emblems of our Saviour's Passion—the pillar, the scourge, the ladder, the spear—a small ruby being set in the centre above the head of Christ.

Ring posies are, of course, required to be very concise, and can rarely be suffered to exceed a short couplet. Many of these conceits, although laboured, are hardly worth being carved in gold. Others, such as "All thine is mine," are so abrupt an avowal of a husband's usurpation of person and estate as to seem too outspoken for a wedding ring. The inscription on a Monmouthshire ring, "If thee dost not work thee shas't eat" (*sic*), is also too huckstering for our taste. "All perfect love is from above" is pious but trite, and, indeed, it is hard to find a ring inscription that is not so. The following are at least rhythmical, and are better than many: "You and I will lovers die," "My promise past shall always last," "A loving wife prolongeth life," "This hath no end, my sweetest friend," "All I refuse, but thee I chuse," "Let him never take a wife that will not love her as his life"; but "If I think my wife is fair, What need other people care," is rather too plain a hint that she is not fair. Extemporized wedding rings have necessarily sometimes been of the inferior metals, and occasionally not of metal at all. There is an instance of a leather ring made on the spur of the moment out of an annulet from the finger of a bride's glove. Even the church key has been used in the wedding ceremony, and, as is well known, the Duke of Hamilton was married to one of the beautiful Miss Gunnings with a ring of the bed curtain, at half-past twelve at night, at Mayfair Chapel.

"Anniversaries," by Mr. Danby P. Fry, is a very clear explanation of the change of style in the English Calendar which took place in 1752, by which eleven days were subtracted from that year, thus rendering the common celebration of the anniversaries of events before that date eleven days in arrear of the natural time. A notice of the battle of Trafalgar from a contemporary MS. might seem, with its Table of Signals, better fitted for *The United Service Journal* than for an antiquarian magazine. Mr. J. H. Parker's article on the roads and aqueducts of Rome contains, unexpectedly enough, some fresh treatment of the rather worn subject of the symbolism of the nave of a basilica or church. The account of the "Settlement of French Protestants in America" is worthy of the editor of several of the Colonial Series of State Papers, Mr. W. Noel Sainsbury. The symbolism and meaning of some "Ancient Forms of the Cross," by Mr. J. Jewell Jewitt, is full of curious and minute investigation, and, like his papers generally, is well illustrated with woodcuts.

On the whole, the present volume gives promise of good work in the now fashionable cause of antiquarianism; and there is evidently a steady endeavour to render the publication worthy of the acceptance of an increasing number of readers to whom the past is more beautiful than the present, or who at least find it an agreeable retreat from the dust and turmoil of every-day life. These are not a Philistine class, and it would be a pity indeed that so handsomely executed a book should be offered them if they were. We trust that *The Antiquary* will have a long and useful career.

#### KITH AND KIN.\*

CRITIC has not unfrequently to deplore the low moral tone of the characters in the novels which he reviews. It is seldom that, as in the case of Miss Fothergill's *Kith and Kin*, he has to complain of a too lofty morality. Miss Fothergill's heroine, Judith Conisborough, breathes an ethical air so high and so rarefied that it is impossible for other people to live up to her ideas of life and duty. To put it otherwise, Judith has the most absurd and even idiotic scruples, which she permits to stand, not only between herself and happiness, but between her sister and an attached and passionate, though rather underbred and affected, lover. In Miss Fothergill's new novel the course of true love would have run as smooth as a canal, if the high-flown heroine had not put her foot, so to speak, into the fountain at its very source, troubled the water, and made the stream squirt over all manner of rough and stony ground.

Judith Conisborough was a young lady who deemed it morally impossible for herself or her pretty sister Delphine to marry the men of their hearts, because their mother had once, not exactly told a falsehood, but permitted a somewhat perverted view of the truth to be accepted where her own interest was concerned. We are informed that Judith and her sister, though they lived in an out-of-the-way part of Yorkshire, where there are no circulating libraries, and though they could not afford to subscribe to Mudie's, had yet been baptized with the spray of the mighty wave of Progress. But surely Progress has not come to this point; it is not universally understood, even in advanced places like Birmingham, that a lady may not marry because her mother did not prevent her uncle from quarrelling with his daughter-in-law. If ideas like this are to be accepted, the peccadilloes of the fathers will soon cease to be visited on the children. There will be no children at all. There will be no marrying nor giving in marriage. Lovers, with writhing lips and pallid faces, will confide to each other that their mother once jilted a guardman; that their father was a sad firt; that

\* *Kith and Kin*. A Novel. By Jessie Fothergill, Author of "The First Violin." London: Richard Bentley & Sons. 1881.

they are dishonoured, blighted beings, who must hide their heads as nurses in hospitals, till death relieves them from the burden of hereditary guilt. We almost prefer a frank set of sinners to people whose moral tone is so highly strung. Lest the reader should suspect us of exaggerating the austere Judith's conception of duty, we must analyse the plot of Miss Fothergill's story. And to do this is to do the book no wrong. The plot is not concealed cunningly, with the skill of Gaboriau or Hoiagobey. Any one can see how matters will fall out as soon as he is introduced to the characters, though perhaps the most acute reader could not foresee the nature of Judith's singular scruples.

We are first introduced to Bernard Aglionby and Percy Golding. Aglionby is a salesman of cotton goods at Irkford, a large manufacturing town. He has "a dark, lean visage" and a smile "the reverse of angelic." At first we rather hoped that Aglionby was the villain of the piece, for he was a Radical and an Agnostic, and he was going to cheer Mr. Bright at a big Liberal "demonstration." Percy Golding, on the other hand, had the air of a hero. He had "a fair and ingenuous countenance." He was a Tory, and, to put it shortly, was "a commonplace type, with a stick and a pipe," "a threepenny 'bus young man." But our sympathy in this romance is to be with the "*je ne sais quoi* young man," Mr. Aglionby, the young man who is dark, and lean, and liberal to a degree, and enigmatic. Aglionby goes to his demonstration, cheers Mr. Bright, and behaves with courtesy to a fine old country gentleman and a very handsome dark young lady, who have strolled into the "Temple of Ceres." Then Aglionby goes home, and has tea with Lizzie Vane, his betrothed. Miss Vane's dress is thus described:—

Miss Lizzie Vane wore a dress which faithfully followed every worst point of the prevailing fashion; and exaggerated all of them a little, by way of originality. Her gown was the gown of the present day. It fitted her almost half the length from her throat to her heels, like a skin; it was well tied back just behind the knees, and on the ground behind an abundance of perfectly meaningless little frills, arranged upon a spoon or wedge-shaped piece of stuff, wagged and whisked about with her every movement. This was the "train" of Miss Vane's gown; for a young lady moving in her exalted sphere, and living too in one of the palatial family mansions of Crane Street, could hardly be expected to dispense with so useful, so necessary an appendage.

Now, pretty as Miss Vane was, with a "long, slender, white throat, and a lovely little head," and an exuberant fringe, and forget-me-not-blue eyes, and "a bust and hips forced into a prominence displeasing in itself," one at once perceives that she is not the right bride for a stern swarthy Agnostic. She is much better fitted for the commonplace type—for the Conservative, and therefore brainless, Christian, Percy Golding. Moreover, when we find that the tall dark girl of the public meeting is once more brought by accident into contact with Aglionby, we feel certain that she, and no other, is the dark Agnostic's fated bride. But this dark young lady, Judith Conisborough, will not let things arrange themselves. She was the daughter of a Mrs. Conisborough, who, again, was the piece of old Aglionby of Scar Foot, the old country gentleman who attended Liberal demonstrations. Some twenty-eight years ago, Mrs. Conisborough was a young lady, living with her uncle and his only son at Scar Foot, a beautiful place in a lonely Yorkshire dale. Old Aglionby was an old tyrant, a domestic despot. He insisted that his only son should marry his niece; the son refused, left home, wedded a woman of the middle classes, and was cast off by his father. The son died, leaving a little boy, and then old Aglionby showed a singular want of discretion. His niece was by this time a married woman with a child, and it was of course her interest that Scar Foot should become the heritage of herself and her offspring. In spite of this the old Squire thought her a proper person to send with his proposals to his son's wife. He would support her if she would let her boy live with him for eleven months in the year. Mrs. Conisborough carried an oral message to the widow, and she did not carry it in an agreeable or acceptable form. When the widow refused with scorn, and said that her relations would not allow her child to starve, Mrs. Conisborough permitted old Aglionby to suppose that the aforesaid relations were rich people, and that the boy would be properly educated. But when old Aglionby, casually meeting his grandson at the demonstration and at the theatre, cleverly divined the relationship, he was shocked to find that he had been deceived by Mrs. Conisborough. After a stormy interview with young Aglionby, who had a good deal of his own temper, he went home to Scar Foot. His niece, with her three daughters, Judith, Delphine, and Rhoda, lived, in great poverty, at the neighbouring town of Yoresett. The old tyrant had meant to make them his heiresses, but meanwhile kept them poor, and subject to his despotism. On reaching home, he violently insulted Mrs. Conisborough, turned Judith out of his house, sent for the lawyer, changed his will, and died, full of years and ill-temper.

After young Aglionby became, by his grandfather's will, the lord of Scar Foot, he set about falling in love with Judith, with the utmost promptitude and despatch. He also initiated her into what seems to be the chief article of the cheerful creed of Agnosticism—namely, that the sins of the fathers are visited on the children. Now Judith, by putting various things together, had discovered the nature of her mother's offence, and divined that she had not done her uttermost to reconcile the mother and the grandfather of young Aglionby. Judith leaped to the conclusion that she and her sisters were involved in some mysterious Atā, or family curse. Even after Lizzie Vane, a lively and amusing young person, had ceased to conceal her preference for

Toryism and Christianity in the shape of Percy Golding, even after Bernard was free, Judith persisted in taking refuge from Atā as nurse in a hospital. When a neighbouring hobereau, Randolph Dancesdale, son of the local baronet, fell in love with Delphine, Judith's gloomy preachings made Delphine reject him. So every one went on being profoundly miserable, and bullying poor Lizzie Vane for her want of breeding, till Mrs. Conisborough revealed her secret sin to Aglionby. This scene is excellent, as Mrs. Conisborough is able, even on her deathbed, to make out a pretty good case for herself. Armed with her confession, Aglionby makes Judith relent, Delphine does the same, and all, without exception, are as happy as they might have been if Judith had possessed a little common sense.

Provoking as Judith's conduct is, the novel is eminently easy, and even pleasant to read. The style is clear and unpretentious, the descriptions of nature few and well done. Randolph Dancesdale is not quite a gentleman, and permits himself to be affectually offensive to guests in his father's house. Rhoda Conisborough, a mere sketch, is a charming figure. So is Delphine; and we have not concealed our partiality for Miss Vane, in spite of her fringe and her frivolity. The younger Aglionby is the virtuous Rochester (Miss Brontë's, not Charles II.'s) of an Agnostic age. Miss Broughton would have drawn old Aglionby in a more amusing style. But with Judith we imagine that few readers will keep their patience. Heroes are usually prigs, but it is unnecessary that a prig should be the heroine.

#### NELSON ON HINDU LAW.\*

THE technical and unattractive title of Mr. Nelson's book conceals a critical essay on a subject of considerable social and political importance. His real purpose is to demand a serious reconsideration of the system on which English judges and magistrates administer justice in the South of India. Some preliminary statement of the facts is needful to make the nature of the case he puts forward generally intelligible. A great number of tribes and castes, differing widely in race, language, and manners, but agreeing in this, that they are, with trifling exceptions, non-Aryan, live under British government in the Madras Presidency. The British Government throughout India professes to maintain and administer the native customary laws in matters of inheritance and the like. We have no common English term or terms that will properly denote the field thus reserved to native law, but the German *Familienrecht* and *Erbrecht* may be taken as together covering it with sufficient exactness. Two principal systems or types of "native law" have been studied by Anglo-Indian scholars and lawyers. One of these is the Mahometan, which does not now concern us, and which has been imported within historical times. The other is the Hindu, or more properly Brahmanical. This, we now know, was imported by the Aryan conquerors of Upper India, or rather developed by them at some unknown time after their settlement. As regards Bengal and the Central Provinces, Hindu institutions are probably native, in anything like their present form, in the literal sense, and certainly native for all practical purposes. But in the South of India the Aryan settlement was never more than superficial. Aboriginal, or relatively aboriginal, manners and superstitions have received a more veneer of Brahmanism, if so much. Because the religious externals of Hinduism have been adopted, it does not follow that Hindu religious ideas have been allowed to prevail over older social usages which may be inconsistent with them. Nor does it follow, even if Hindu customs have been actually adopted to some extent, that they have been adopted altogether. Therefore it becomes the business of the Government to ascertain concerning every sort of people who seek civil justice at its hands how far they have come under the rules of Hindu law and usage; and, in so far as they have not, what their own customs are. Of course there are to be found in corners of every Presidency and province of India savage or half-savage tribes who are no more Hindus than than they are Quakers; but these give comparatively little trouble. The non-Aryan people of the southern peninsula are civilized enough to be litigious. We assume for the moment that Hindu law and usage, as applicable to undoubted Hindus, are sufficiently understood by the English authorities.

How then have we performed this duty of doing justice to the Southern people according to their own customs? Nobody denies that we have honestly tried to do it; but Mr. Nelson asserts, not without support from some of the best recent authorities, that we have made serious mistakes. English judges and officials were naturally under strong temptation to be guided as much as possible by that kind of native law which existed as a more or less coherent system, and which they thought they knew something about. They were mostly unable to observe for themselves (it is said, indeed, that no European can get to the bottom of native institutions and family life in any part of India); and most of their information about native usage was derived in the first instance from Brahmins; in other words, from a class of persons who were nearly as much strangers in the land as themselves, and whose interest and prejudices would and did lead them in every way to magnify the authority of Brahmanical usage and the extent to which it was regarded as binding. Then, courts on the English

\* *A Prospectus of the Scientific Study of the Hindu Law.* By J. H. Nelson, M.A., a District Judge in Madras, &c. London: C. Kegan Paul & Co. Madras: Higginbotham & Co. 1881.

system being established and decisions reported, the judges began to develop and define legal rules in the English fashion. When they had once decided that a particular maxim about inheritance or adoption was part of the Hindu law accepted in the South of India, and as such binding on the people of a given district and caste, they felt bound to decide the same again, although other and better information had come to light than that on which they first proceeded. And thus it has come about that we are elaborately administering to a great number of people, under the name of Hindu law, a set of rules and ordinances which in some cases are known, and in more are suspected, to have about as much relation to the customs they really use among themselves as the English law of real property. We may add that in at least one case the absurdity of this proceeding (from which, however, the Court did not see its way to escape) has been judicially recognized.

But this is only half Mr. Nelson's complaint. It seems odd enough that our courts should enter into minute discussions of Hindu law for the benefit of suitors who are not Hindus at all. But Mr. Nelson further says that we do not know what Hindu law really is, and that much of what we have administered under that name is the speculative deduction of English lawyers from imperfect or erroneous premises. On this ground, too, he has much to say for himself, and some of the most important points are, so far as we can discover, undisputed. So that there are two distinct questions: To whom is Hindu law, whatever that may be, applicable? and, What is Hindu law? These questions are obviously different in kind. The first is a matter of ethnology and existing facts, which in a particular case of doubt can be dealt with only by careful inquiry on the spot. The second involves, or may involve, points of Sanskrit scholarship and critical archæology, much sifting of Brahmanical tradition and Brahmanical and other native opinion, and a good deal of local inquiry besides. It would seem, therefore, the natural course at first sight, at any rate for an inquirer chiefly interested in the administration of justice in Madras, to deal with the ethnological question before the critical one. But Mr. Nelson takes them in the reverse order, and not without reason, as we see when we have come to the end. Hitherto the rule of English officials has been to presume that people who were to outward appearance Hindus were governed by Hindu law, and to throw on those who alleged any different custom the burden of strictly proving it. The ground would be cut from under this presumption if it could be shown that the current English view of Hindu law as a complete and uniform system, accepted with only slight local variations throughout the Aryan communities of India, and ultimately resting on certain generally acknowledged authorities, is mistaken, or at least exaggerated. And this is exactly what Mr. Nelson endeavours to show. He has gone about this part of his work, we think, with a certain excess of zeal. He commits himself here and there to conjectures which most Sanskrit scholars will probably deem paradoxical; and he has too much the air of one crying in the wilderness. His general position has been far more widely admitted than any one would think from reading the book itself. Ten years ago Sir Henry Maine stated, as the opinion of the best modern authorities, "first, that the codified law—Manu and his glossators—embraced originally a much smaller body of usage than had been imagined; and, next, that the customary rules, reduced to writing, have been very greatly altered by Brahminical expositors, constantly in spirit, sometimes in tenor." And he speaks of the actual unwritten usages of the people, more especially in the North-West, as "probably older and purer than the Brahminical written law." To the same effect Dr. Hunter writes (expressly citing an earlier work of Mr. Nelson's, published only in India) in his article on India in the new *Encyclopædia Britannica*. He plainly says that the ancient Hindu customs, the so-called codes of Manu and Yājñavalkya (on which all the later law-books and commentaries profess to depend), "only recorded the usages of certain Brāhmanical centres in the North, and perhaps did not fairly record even them." And again, "the High Courts" (of the Presidency towns) "enforce the Brāhmanical codes with a comprehensiveness and precision unknown in ancient India." Once more, to return to Sir Henry Maine, "Indian law may be affirmed to consist of a very great number of local bodies of usage, and of one set of customs, reduced to writing, pretending to a diviner authority than the rest, exercising consequently a great influence over them, and tending, if not checked, to absorb them." Statements of this kind, and from such writers, might perhaps be thought to make it superfluous, as regards any practical conclusion, to enter into minute criticism of the origin and relative authority of existing Sanskrit law-books. Mr. Nelson, however, seems not content to stop here. He is so anxious to show that there is really nothing but local custom that he ignores even the encroaching and absorbing tendency pointed out by Sir Henry Maine. We understand Sir Henry Maine to speak of it as a known fact. But the thing is, anyhow, so probable that it would require strong evidence to convince us that it has been otherwise. When customs of uncertain extent and differing in detail, but embodying a common order of ideas, are reduced to writing and commented on, a kind of competition is necessarily set up, in which one or two of the rival recensions will prevail. Mr. Nelson will have it that the superior authority ascribed to particular Sanskrit books by Anglo-Indian lawyers is a mere figment, based on gross error or rash conjectures; and on this point, as it appears to us, he undertakes to prove too much.

It is quite possible that, as Mr. Nelson maintains, the *Mānava Dharmasāstra*, commonly called by English writers the Code of

Manu, was originally nothing but the custumal of a particular sect of Brahmins, called *Mānavas* as being professed followers of some mythical or historical personage named *Mānu*. But this neither proves nor tends to prove that when Sir William Jones first heard of and read Manu the book had not come to be accepted as authoritative (subject to sundry and more or less divergent glosses and interpretations) by the great bulk of orthodox Hindus. In one sense, no doubt, it could not be accepted by the majority of Hindus, nor could any other Sanskrit law-book, for the simple reason that they are not, nor have their ancestors been within historical times, able to read or understand it. But this is known and allowed on all hands. The fact that unlearned Germans cannot read Latin does not make it the less true that Roman law is the foundation of the common law of Germany. Mr. Nelson expects us to believe that Sir William Jones as to Manu, and Colbrooke as to the books of authority in Southern India, were deceived or rashly credulous, not merely as to the origin or age of the particular books, but as to the esteem in which they were actually held at the time. "How did it come about," he asks, "that the law-book of an obscure, petty, extinct sect was believed and declared by Sir William Jones to contain the law of the Hindus generally?" How, indeed? Mr. Nelson cannot get off, we think, by leaving it for others to "settle this curious question hereafter." This is to leave an unexplained and violent improbability confronting his theory. And how did it come about, we further ask, that no native scholar or pleader from one end of India to the other, and from Jones's time to this, ever protested against a misapprehension so enormous? There is no lack of such men who know enough of European critical methods to see the importance of the question. Again, Mr. Nelson suggests that the *Mitāksharā*, which is his peculiar aversion as being the leading received authority with the British courts in the South, may date from the seventeenth or even eighteenth century instead of the early middle ages. If so, that would surely be rather in its favour from his point of view, for he does not set up any case of deliberate perversion in the Brahman interest, and apart from this the work would be all the more likely to correspond to the facts of recent usage. Much more important is the general consideration, admitted by the Sanskrit books themselves, but too often overlooked by English judges, that the texts are at most records of typical customs, and must always yield to proof of an existing contrary custom applicable to the case in hand.

Perhaps we may be helped to a juster apprehension of the problem by a comparison which we have already used, and which, though not exact, is near enough to be instructive. Let us suppose that a foreigner without any previous knowledge of Roman law has to study the common law of the old German Empire. He will first learn in a general way that the "paramount authority," to use a current Anglo-Indian phrase, is to be found in the texts of the Roman Corpus Juris. His tendency will be to solve particular questions by direct investigation of the texts. Then he will learn that this is an impracticable method; that there are established traditional interpretations and conceptions which have largely superseded the text itself; and that some parts of the Roman institutions are obsolete, while others have never been received. Yet more, he will discover that the application of the law is subject to local variations and exceptions, of which the principle is expressed in the maxim "*Stadtrecht bricht Landrecht, Landrecht bricht Gemeinrecht*," and that these exceptions are many and grave. It would not be wonderful if at this point he were to run into the opposite extreme to the simplicity of his first belief, and deny that the common foundation of Roman law had any real existence. Mr. Nelson appears to be in some such stage of thought as regards Hindu law; he writes like a man still in the anger of disillusion. We have said nothing about the mistakes stated to have been made by our courts through sheer ignorance or mistranslation of the Sanskrit law-texts, because that (though a serious matter enough in itself) seems to us a collateral point hardly touching the main argument. And Mr. Nelson's critical opinion of those texts is of course a thing apart from his opinion as to the habits and wants of the people among whom he lives, and does not affect its weight.

#### NUMA ROUMESTAN.\*

A PUFF preliminary issued among the leaves of M. Alphonse Daudet's latest novel informs us—which is, no doubt, true—that the book has been eagerly looked for. "On sait," it goes on, "que plus de quarante mille exemplaires étaient demandés à l'éditeur Charpentier avant que le volume ait paru. C'est un fait presque sans précédent, et l'on peut prédire la durée de ce succès bien mérité, car il est peu de romans aussi attachants, aussi remplis de charme et d'ironie, aussi amusants, en un mot, que ce nouvel ouvrage de l'auteur de *Froment Jeune et Risler Aîné* et du *Nabab*." It is not to be supposed that M. Daudet is responsible for this style of advertisement; but, at the same time, it is amusing to find it attached to a book the chief object of which is to depict the nature of the *hommes au Midi*. The title-page of the book, it may be noted, bears under the name of the principal character the words "*Mœurs Parisiennes*," which again is a little amusing, as "*Mœurs du Midi*" would surely have been a more appropriate title. On a former occasion M. Daudet held up the people of the Midi

\* *Nouvelles*. Par Alphonse Daudet. Paris: Charpentier.

to good-natured ridicule in that delightfully amusing book *Tartarin de Tarascon*. Whether they will be grateful to him for this more serious and more elaborate attempt to depict their nature is perhaps an open question; but as to the success of the attempt considered as a piece of character-drawing there can be little doubt. Indeed, so keen and clever is the study that it becomes a comparatively unimportant matter that to the construction of the book it is impossible to give much praise. M. Daudet has sometimes been called, foolishly enough, the French Dickens, and in *Le Nabab* he introduced what certainly looked like a servile imitation of one of Dickens's most humorous scenes, much as in the most important scene of *Fromont Jeune et Risler Aîné* he followed closely enough in the footsteps of Thackeray. But, without comparing him with either of the writers just named, it may be said that he has quite enough original power to stand on his own merits. In *Numa Roumestan* he has written of what he knows thoroughly, and, so far as study of character and description go, he has perhaps never done anything better.

We are first introduced to Numa Roumestan at "une grande fête de jour aux arènes d'Aps-en-Provence. . . . Voilà dix ans que Numa, le grand Numa, le député leader de toutes les droites, est prophète en terre de Provence, dix ans que, pour ce fils illustre, la ville d'Aps a les tendresses, les effusions d'une mère, et d'une mère du midi, à manifestations, à cris, à caresses gesticulantes." The chatter and movement of the adoring multitude, Numa's expansive, good-humoured reception of their homage, his swift, almost unconscious, change of manner for each person to whom he talks, the glaring brilliancy of the scene with the crowd of excited Provençals—all this is admirably hit off. Only one personage in the assemblage seems bored—and that is Numa's wife. "Ces gaietés méridionales, faites de turbulence, de familiarité, cette race verbeuse, tout en dehors, en surface, à l'opposé de sa nature si intime et sérieuse, la froissaient peut-être sans qu'elle s'en rendit bien compte, parce qu'elle retrouvait dans le peuple le type multiplié, vulgarisé, de l'homme à côté de qui elle vivait depuis dix ans et qu'à ses dépens elle avait apprise à connaître." When her silence seems to reproach Numa for the impossible promises of places which he scatters broadcast among the crowd, he says to her:—"N'oubliez pas que nous sommes dans le Midi, entre compatriotes parlant la même langue." The promise is taken in the same spirit in which it is given. It gives those to whom it is made a pleasant subject for their imagination to play with. "Pourquoi les priver de cette joie? Du reste, voyez-vous, entre méridionaux les paroles n'ont jamais qu'un sens relatif. C'est une affaire de mise au point."

It is perhaps one of the faults in the construction of the book that Numa's history, as related by M. Daudet, dates, to begin with, backwards from the opening chapter, and then has to be caught up again at or near the point of his first appearance. Thus it is not until we have read some way into the book that we come to what may be called the key to Numa's character, as it is to the feeling towards him on his wife's part. Some time after they had been married she came into his study, and found him writing a letter, which she asked to see. "C'était, en style maigre et emphatique, ce style de barreau qui gesticule avec de grandes manches, une lettre à l'Empereur, par laquelle il acceptait le poste de Conseiller d'Etat. Cela commençait ainsi: *Vendén du Midi, grand dans la foi monarchique et le culte respectueux du passé, je ne crois pas forfaire à l'honneur ni à ma conscience* . . . ." When she had read thus far Rosalie exclaimed, "Tu n'enverras pas ça!" He answered her with scolding eloquence, "Il tonnait, comme à l'audience, devant la tranquillité muette, presque méprisante, de Rosalie," and she replied by repeating what she had said before, and adding, "ce serait mentir à ta vie, à tes engagements." Then she reminded him how he had first won her heart by his denunciation of the "masquerade impériale," and finally she over-persuaded him, so that the letter as sent ran thus:—"Vendén du Midi, grand dans la foi monarchique et le culte respectueux du passé, je croirais forfaire à l'honneur et à ma conscience en acceptant le poste que Votre Majesté, &c." This letter it was that made Roumestan's political fortune. Like many great men, Roumestan has a hanger-on, a certain Bompard, who is a variety of the Tartarin genus, and who never hears a great man or a great event mentioned without giving some personal reminiscences. Any one who took the trouble to piece them together would have discovered that Bompard in one and the same year "commandait une compagnie de déserteurs polonais et tcherkesses au siège de Sébastopol, dirigeait la chapelle du roi de Hollande, du dernier bien avec la sœur du roi, ce qui lui avait valu six mois de casemate à la forteresse de la Haye, mais ne l'empêchait pas, toujours à la même date, de pousser une pointe de Laghouat à Gadamès, en plein désert africain."

The pathetic interest of the book is mainly supplied by the contrast of character between Roumestan and his wife, which at one point leads to a tragic situation, and by the misfortunes of a certain Valmajour, a player of the *tambourin* and *galoubet*, who is a native of Aps-en-Provence, and who is befooled by Roumestan's meaningless promises into leaving his home and coming to meet with a disastrous failure on the Paris stage. The first description of Valmajour in his fine simplicity, and the subsequent accounts of his demeanour after he has been spoilt by the hope and promise of notoriety, may be counted among the finest touches in the novel. In connexion with this Valmajour and with Roumestan's sister-in-law there is an underplot, which seems to

us by far the weakest and least artistic point in the work. Granted—and this is perhaps not much to grant—that she could be for a time under the spell of Valmajour's *farouches* picturesqueness, and that this should lead her into certain difficulties, it is, we think, hardly possible that she should have allowed herself to be so tyrannized over by Valmajour's sister, on the ground of her being his "promise." The situation is, as it strikes us, long drawn out, and disagreeable without being forcible. But, as we have said, this and other faults are outweighed by the freshness and force displayed in the treatment of the principal characters. We have spoken of the descriptive skill found in many passages of the book, and we may close our notice by quoting the account of the *farandole* which follows Valmajour's performance in the first scene:—

Valmajour salua sans un mot, tourna sur ses talons et descendit le large tapis de l'estrade, sa caisse au bras, la tête droite, avec ce léger déhanchement du Provençal, ami du rythme et de la danse. En bas des camarades l'attendaient, lui serraient les mains. Puis un cri retentit: "La farandole!" clameur immense, doublée par l'écho des voûtes, des couloirs, d'où semblaient sortir l'ombre et la fraîcheur qui envahissaient maintenant les arènes et rétrécissaient la zone du soleil. A l'instant le cirque fut plein, mais plein à faire éclater ses barrières, d'une foule villageoise, une mêlée de fleches blanches, de jupes voyantes, de rubans de velours battant aux coiffes de dentelles, de blouses passementées, de vestes de cadis.

Sur un roulement de tambourin, cette cohue s'aligna, se défilait en bandes, le jarret tendu, les mains unies. Un trille de galoubet fit onduler tout le cirque, et la farandole menée par un gars de Barbantane, le pays des danseurs fameux, se mit en marche lentement, déroulant ses anneaux, battant ses entrechats presque sur place, remplissant d'un bruit confus, d'un froissement d'étoffes, et d'haleines, l'énorme baie du vomitoire où peu à peu elle s'engouffrait. Valmajour suivait d'un pas égal, solennel, repoussait en marchant son gros tambourin du genou, et jouait plus fort à mesure que le compact entassement de l'arène, à demi noyée déjà dans la cendre bleue du crépuscule, se dévidait comme un bobine d'or et de soie.

— Regardez là-haut! dit Roumestan tout à coup. C'était la tête de la danse surgissant entre les arcs de voûte du premier étage, pendant que le tambourinaire et les derniers farandoleurs picquinaient encore dans le cirque. En route, la ronde s'allongeait de tous ceux que le rythme entraînait de force à la suite. Qui donc parmi ces Provençaux aurait pu résister au sifflet magique de Valmajour? Porté, lancé par les rebondissements du tambourin, on l'entendait à la fois à tous les étages, passant les grilles et les soupiraux descellés, dominant les exclamations de la foule. Et la farandole montait, montait, arrivait aux galeries supérieures que le soleil bordait encore d'une lumière fauve. L'immense défile des danseurs bondissantes et graves découpait alors sur les hautes bules entrées du pourtour, dans la chaude vibration de cette fin d'après-midi de juillet, une suite de fines silhouettes, animait sur la pierre antique un de ces bas-reliefs comme il en court au fronton dégradé des temples.

#### JOWETT'S THUCYDIDES.\*

THERE is perhaps no point in which the difference between the educational methods of the two great Universities is so conspicuously displayed as in the matter of translations from Greek and Latin prose authors. We say "prose" because, owing to the diversity of ancient and modern metres, the closest poetical rendering of poetry must always be more or less of a paraphrase. But when it comes to the rendering into English of a philosopher or historian, it is obvious that, barring a few highly idiomatic phrases, every sentence may be turned word for word without loss at all events of intelligibility. It is, however, equally obvious that what may be a good style in Greek or Latin need not necessarily be so in English, and further, that it is possible to express the same meaning in various styles—such a process, under the name of "paraphrasing," forming, indeed, one of the earliest exercises undergone by pupil teachers and other young people who are learning the use of their native tongue. Thus, too, when the revisers of the New Testament give us, in place of "the shipmen deemed," "the sailors surmised," though we may wonder at their taste, we cannot say that they have modified the meaning of the words. But whether Buffon or any one else did or did not say "Le style c'est l'homme," there can be no question that a man's style gives an indication of the way in which his mind works, such as may often be of the highest importance as a help to the right appreciation of his meaning, especially where there is also a question between various readings. Recent Cambridge translators, regarding a translation as being merely an aid to persons wishing to read the author in his own language—something to be used, in the words of Pericles, *ἔργον μᾶλλον κατὰ ἡ λόγον κόμψω*—have gone perhaps as far as is desirable in the direction of literal rendering. In one case, indeed, the translator's anxiety not to misrepresent his author has led him to retain many of the original words, Greek and English being thus mingled with a somewhat comical effect. Effacement of oneself and loyalty to one's author reach their limit here. It would be an interesting question (upon which, however, we do not propose to enter now) how far this is a mark of the extent to which devotion to the exact sciences has moulded Cambridge thought in reference to other branches of study. The tendency of Oxford scholars is no less marked in the opposite direction. There is a rather malicious legend extant to the effect that when Professor Jowett's translation of Plato appeared, an Oxford admirer—hoping, no doubt, to elicit a complimentary reply—inquired of a Cambridge friend, competent to judge of the work alike under either aspect, what opinion was taken of it in his University. "Well," was the pitiless response, "we doubt if he understands the philosophy; and as a crib we think it valueless." It is only with the latter

\* *Thucydides*. Translated into English by B. Jowett, M.A. Oxford: Clarendon Press. 1881.

part of this judgment, of course, that we are now concerned; and, without endorsing it unreservedly, we cannot deny that it is in a great measure applicable to the work before us. The Professor may of course reply that he does not mean his work for a "crib"; and, judging from some things which we have heard about the way in which Oxford men nowadays read the Classics, we can quite imagine that a term implying any study whatsoever of the original Greek might be out of place. But, if so, why translate Thucydides at all? In the case of philosophy it is, no doubt, useful for the student to have access to the thoughts of each thinker without the necessity of puzzling them out of his language; but no one who wants merely to learn the history of the Peloponnesian war would go to Thucydides, even in the original, rather than to Grote; so what would he do with a translation? It is, then, after all, upon its merits as an aid to reading the original Greek which Thucydides wrote that we must estimate Professor Jowett's version; and, judged by this measure, we cannot consider it as a work worthy of one of the Royal teachers of the Greek language.

In the first place, without requiring a close copy of Thucydides's fearful and wonderful *anacolutha*, which are feebly represented by the famous "An awkward beast to drive is pigs; one man many of them very," and which arise mainly, no doubt, from the struggles of an acute intellect to express itself accurately in a language not yet completely developed as regards its grammar; and fully recognizing the duty of an English translator to obey the ordinary rules of English syntax, we must demur to a style which renders a *καί*, a *τε*, a *γάρ*, or a *ὥστε*, to say nothing of even more important particles, alike by full stops and semicolons, and expands (as in iv. 26) *αἴτιον* into "the secret of this protracted resistance." Nor, again, do we understand why (as in iv. 40) a simple phrase like *παρὲ ὕπερον* should be left altogether unrepresented. In the previous chapter the Professor seems to have gone out of his way to emphasize the dislike of Thucydides to Olen. *Καίτερον μάλιστα οὐρα ἢ ὑπόσχεσις* does not mean "the mad promise," nor should we envy the fate of the schoolboy who happened to render either phrase by the other.

But it may be better to "instance in" a longer passage, in order to give an idea of the Professor's style, which, if it is at times a little too ornamented, often flows smooth and limpid; and also to show by a typical example the way in which he appears to us to fall short of the mark as a translator of Thucydides. We will take Book v. Chap. 89, wherein the Athenians, opening their controversy with the Melians, anticipate a form of political reasoning not unfamiliar—in the mouths of foreigners—at the present day. We assume the possession by our readers of what Mr. Colclough called "all the works of Thucydides." They will thus be able to compare the original with Professor Jowett's rendering, which runs as follows:—

Well, then, we Athenians will use no fine words; we will not go out of our way to prove at length that we have a right to rule, because we overthrew the Persians; or that we attack you now because we are suffering any injury at your hands. We should not convince you if we did; nor must you expect to convince us by arguing that, although a colony of the Lacedæmonians, you have taken no part in their expeditions, or that you have never done us any wrong. But you and we should say what we really think, and aim only at what is possible, for we both alike know that into the discussion of human affairs the question of justice only enters where the pressure of necessity is equal, and that the powerful exact what they can, and the weak grant what they must.

Now it appears to us, if we may without presumption differ from the Professor, and indeed from other authorities, that the opposition between *δυνατὰ* and *δίκαια*, "might" and "right," is missed in this version. Venturing on a rough summary, we should put it somehow thus:—"We are not going to offer a long argument about the *right* of our case, nor do we recommend you to expect to persuade us by doing the same, but rather to settle the question of *might* according to the thoughts that we both of us really have in our minds, for we and you both know quite well that the question of *right* only comes on for decision in human affairs when the force [or stress] is equal on both sides, but that when it is a question of *might*, the stronger exact and the weaker give in." Throughout this "Melian controversy," which, as being perhaps the most notorious *crux* in the whole of Thucydides, demanded specially careful handling, there appears far too great a tendency to shirk difficulties by means of paraphrase. Once or twice we find cases in which a better rendering of even a few words might have been given—e.g. in chap. 105, *μακαρίστους ὑμῶν τὸ ἀπειρόκακον* is rather "congratulating you on your innocence of evil" than "admiring the simplicity of your idea." One is as easy to write as the other, but one gives, as the other does not, the fundamental meaning of the Greek words.

This tendency to give a general rather than the particular interpretation is always appearing. Take, for instance, Pericles's defence, in Book ii. 60 *egg*. The second sentence of this runs somewhat in this way:—"For I hold that when a State is prosperous as a whole, it does more good to its private members than when it is doing well as regards each individual citizen, but is coming to harm in its collective capacity." This is merely a rough rendering; but Professor Jowett ought surely to be able, without loss of elegance, to come nearer to it than "In my judgment it would be better for individuals themselves that the citizens should suffer and the State flourish, than that the citizens should flourish and the State suffer." In the next chapter a point seems to be missed. *Ἐν τῷ ὑπερίπε δόξαντι τῶν νόμων* is not "because your characters are weak," but "at a moment when your judgment is unsound (*lit. sick*)."

This verbal criticism may appear earping. It may be said that if the author's general drift is fairly retained, a strict adherence to his style and language is mere pedantry. We have already given our reasons for holding that in the case of an historian a mere adherence to the narrative is not of much practical use, since few ordinary students of history are likely to want to examine the materials of which their teachers have availed themselves. Those who read Thucydides will, after all, do so mainly with a view to studying the language in which he wrote—not, of course, as a mere organism the structure of which may be dissected, and the evolution of its parts traced out, though this is in itself a study not unfruitful in useful results; but as a vehicle used by an acute thinker for expressing his ideas, with all their sequences and associations. "The difficulty of literature," says a recent essayist, who has himself succeeded very well in surmounting it, "is not to write, but to write what you mean; not to afflict your reader, but to affect him precisely as you wish." Now no language probably, since the world began, has been so fine an instrument for this purpose as the Greek; and it is in proportion as the modern student can see how the ancient author wished to affect his readers that he is entitled to the name of a scholar; so that a Greek scholar means, among other things, a person who has acquired no small insight into the working of some of the shrewdest minds which the world has ever produced. This is a point which would appear to have been overlooked by those who depreciate the study of Greek as an educational exercise; nor can we imagine anything much better adapted to strengthen their view of the matter than to see a Greek Professor translating the chief of Greek political thinkers, a writer embarrassed at times by the fullness of his thought, as though he were a mere chronicler of passing events capable now and then of making a smart remark. It would be strange, indeed, if Greek learning in this country were to receive its heaviest blow from the hand of one whose special function it is to foster it.

We have left ourselves little space to speak of the notes. These are copious and useful. One of their best features is the frequent illustration from the contemporary Aristophanes. Nothing affords a better notion of the most remarkable points in the Greek character than to realize how the Athenian people were able to witness, apparently with perfect enjoyment, the burlesques in which the great comedian extracted fun out of every stage of their life-and-death struggle. The chief point in which we should be inclined to find fault with the notes is, as in the text, the want of appreciation which they occasionally show of the finer points of scholarship; but enough has been said on this head. Students will be as grateful to Professor Jowett for his second volume as they will be ready to dispense with the aid of his first; and every one will be amused with the terms of the dedication to Viscount Sherbrooke.

#### THE PICTURES AT HAMPTON COURT.\*

ALTHOUGH the days are long gone, by since every portrait of Henry VIII. was called a Holbein, and every likeness of Elizabeth a Zuccherò, the old misleading titles are still attached to the frames in the Hampton Court Gallery, and as a natural result the good and genuine works are compromised. When you see "Titian" and "Raffaello" on pictures which evidently were never in Italy, you find it hard to appreciate justly even the real Titian or real Raffaele which may hang close by. Nowhere is this more apparent than at Hampton Court; while some people are perhaps of opinion that there is not a single painting of any value in the whole Palace. We cannot always agree with Mr. Law's conclusions, but his book is an honest attempt to bring order out of confusion, to expose false pretensions and distinguish real merit. It is, moreover, unlike many such books, extremely pleasant reading, being full of historical anecdotes, and also here and there betraying somewhat quaintly the prepossessions and prejudices of the author. It is interesting to see how many of the Hampton Court pictures belonged originally to the collection of Charles I. If Mr. Law's index had been worthy of the book we should have been able to give him more unqualified praise. It is obviously better that a book should have no index than a bad one. As an example, taken at haphazard, we may turn to the index to see if there is a portrait of, say, William, Duke of Gloucester. We find under "Gloucester, William, Duke of, son of Queen Anne, 41, 830." Under "William" we find one reference, "41." Turning, then, to No. 41, we find that the portrait by Kneller has been withdrawn. Turning to No. 830, we find the full description of another portrait by Kneller, and so conclude that at Hampton Court there were formerly two portraits of the Duke of Gloucester by Kneller, and that only one remains there now. But when we go through the catalogue in detail we find two other portraits, with Nos. 192 and 515, both of which Mr. Law identifies with the Prince. We have a few other faults to find, and may as well notice them here. Mr. Law, in his preface, tells us of a picture described in the inventory of the goods of Henry VIII. as a "Table of the Bishop of Rome, and the Four Evangelists casting Stones upon Him." "This," he says, "is doubtless No. 787, with which it exactly corresponds in description." But under No. 787 there is no mention of this circumstance, and a picture, going with Mr. Law's book in his hand, would mislead it, unless

\* *Historical Catalogue of the Pictures at Hampton Court Palace.* By Ernest Law. London: Bell. 1881.

he happened to know the preface very well. In speaking of the famous portrait of Lady Middleton, No. 53, he mentions "Alan Brodrick, created Viscount Middleton in 1710." But Alan Brodrick was created Viscount Middleton, a very different name. About another peer, too, he stumbles sadly. No. 336 represents, we are told, "Edward, eleventh Lord Zouch," who "died in 1625, in his seventieth year, and, leaving no issue, the title became extinct." But Edward, Lord Zouch, was the twelfth in succession, and left two daughters. From one of them descends the present holder of the title, which is not extinct by any means. Under an account of Mirevelt's portrait of Prince Rupert, Mr. Law falls into an old mistake. He says that "to his scientific spirit we owe mezzotint engraving." It has been abundantly proved that Prince Rupert was one of the first engravers in mezzotint, but also that he learnt the art from an older engraver.

If we find fault with Mr. Law's occasional inaccuracies, it is in no carping spirit. His book is so good that we should be glad to see it better, and it is for that reason that we point out its shortcomings. It is more congenial work to call attention to the many interesting facts Mr. Law has elicited in the course of his investigations. We wish, as he has been at the pains of describing carefully each room as we enter it, that he had added a few pages of description of the whole Palace, as his book would then have been a complete guide. As it is, the visitor will require a second book if he wishes to do the place thoroughly. Mr. Law's anecdotes are well selected, and will be new to many of his readers; while others will be amused at such expressions as those with regard to Queen Mary of Scotland. Under No. 560, erroneously indexed as 566, we are told that "the reader will doubtless prefer to turn to the sympathetic verse of the chivalrous Frenchman (Ronsard) than to listen to the detestable libels of her surly maligners." Again, under No. 631, we read of her voyage from France, in 1561, that "in four days she reached the land of fogs and cant and Calvinism." His opinion of the modern "Queen Anne style" is also incisively expressed. The visitor to Queen Anne's drawing-room can judge of the real taste of the day, "which was nothing better than a poor imitation of the bastard-classic of Louis XIV. as distinguished from the so-called Queen Anne style, which never had any existence at all, except an imaginary one in the brains of modern china-manics." Mr. Law has perhaps made this passage a little too strong. He tells a curious anecdote, by the way, in speaking of this apartment. "I wonder," observed the Duke of Sussex, when passing through it, "in which of these rooms it was that George II. struck my father. The blow so disgusted him with the place that he never afterwards could be induced to think of it as a residence." In describing West's picture of the "Apotheosis of the infant princes Octavius and Alfred," Mr. Law tells us that George III. said when the first of them died, "I am very sorry for Alfred, but had it been Octavius I should have died too." Yet Octavius followed his brother within the year. Among the painters of this time occurs the name of Dominic Serres, R.A., a native of Gascony, "who, after running away from home, becoming a sailor, and then master of a trading vessel, and being captured by an English frigate, settled in England and took to painting marine pieces to earn a living." His son was also a painter, and obtained an unpleasant notoriety as the husband of the celebrated "Princess Olive of Cumberland, who lost him his appointment, and brought him to misery, destitution, imprisonment, and madness."

The book is full of curious and interesting notes of this kind. With regard to Mr. Law's critical observations on the authenticity of the pictures, there is also much that is interesting. Of the so-called portrait of Raffaele by himself (No. 710), however, he is careful not to express his own opinion, if indeed he has formed one. Of the companion portraits, formerly hinged together, of Erasmus and Froben, Mr. Law thinks, with Wornum and others, that they have been "improved" by Steenwyck, who put in backgrounds of Gothic buildings to Holbein's "simple foil." Froben was the printer and publisher of the writings of Erasmus, who was in great distress at his death. He had lived in his house for some years on terms of close friendship. It is to be feared that few of the modern representatives of Froben's trade contrive to inspire their unfortunate clients with the feelings of Erasmus towards his publisher. In Chelsea Church there is a well-known monument commemorating a certain Mrs. Spragge, who fought beside her brother in a naval engagement for six hours, and eventually died in child-bed in 1692. One of the pictures at Hampton Court represents probably this very battle. "The Dutch are shown on the left, the combined fleet on the right. At the first onset the French sailed away, and left Sir E. Spragge to bear the brunt of the fight. Tromp came up, and singling out Spragge's ship, the *Royal Prince*, a severe contest took place which lasted three hours. At the end, the *Royal Prince* was so disabled that Spragge had to change his flag into another vessel, in doing which, however, he was drowned. The Dutch said of this battle that the French had hired the English to fight for them, and that they only looked on to see that they earned their wages." Sir Edward Spragge was buried in Westminster Abbey, leaving as his heir his cousin, John Spragge, eventually the husband of the combatant Miss Chamberlain, whose epitaph regrets that she did not live to bear a race of naval heroes. The most remarkable of the pictures at Hampton Court are, of course, the Mantegnas. The series, which comprises nine separate works representing the triumph of Cæsar, is now hung

in the "Communication Gallery," as Sir Christopher Wren named it, being the passage between the king's apartments and the queen's. The cartoons, as they are somewhat improperly termed, were not designs for hangings, but "were painted *in tempera* on twilled linen, with the object of being stretched on frames and affixed to the wall as a frieze." They were purchased by Nys, the agent of Charles I., at Mantua, in 1628, for about 10,500*l.*, some marbles being included. At the Commonwealth they were valued at 1,000*l.*, but were not sold, and they were later reserved to the Protector, who also, it will be remembered, had the good taste to rescue Raffaele's cartoons. They have remained at Hampton Court ever since, and though terribly "restored," in the worst modern sense of that word, are still what Waagen called them, "the most important example of that enthusiasm for the grandeur of the ancient Roman world, which prevailed in Italy in the fifteenth and sixteenth centuries." Mr. Law carefully describes each picture. There is but one painting on the Queen's Great Staircase; but Mr. Law takes the opportunity, before describing it, of introducing a ghost story. On the right as you go down the stair there is a side door. It leads to the "Haunted Gallery," now a lumber-room for old pictures. Here it was that Queen Katharine Howard, having escaped from her own chamber, where she was confined before her removal to the Tower, ran through the passage to obtain an interview with the King. He was at prayers in the adjoining chapel. "Just, however, as she reached the door the guards seized her and carried her back, and her ruthless husband, in spite of her piercing screams, which were heard almost all over the Palace, continued his devotions unmoved." In this gallery, then, a female form is seen, passing and repassing, with wild shrieks, between the entrance to the Royal pew and the door. Mr. Law gives no authority for this thrilling story, and it does not occur in Jesse. But we should be sorry if he had omitted anything so well calculated to deepen a visitor's interest in Hampton Court.

#### CONTRIBUTIONS TO MILITARY AND STATE MEDICINE.\*

THIS is the first volume of a new series which is to be devoted to topics connected with Military and State Medicine. No explanation is given, however, as to the precise objects and intentions of the founders of the series; neither is any information forthcoming as to the names of the founders, or the limitations, if any, to be imposed upon contributors either as regards their qualifications or as to the precise range over which their expositions may extend. Here is the first volume, but who have called it into being, how often we are to look for another, or by whom it is to be supplied—these are questions concerning which we are left absolutely in the dark. This volume consists of two distinct essays by the same writer, a military surgeon, for the first of which he was awarded a medal and prize by the Statistical Society, and for the second a similar distinction by the Army Medical Department. About one-fourth of the volume is occupied by the first of these essays, which treats of "The Effects of Health and Disease on Military and Naval Operations." This is a mere condensed sketch of a very wide subject. Altogether it savours not a little of the "prize essay" quality, and is to a considerable extent composed of quotations. Still the arrangement adopted by the author is good, and many of the topics referred to are of much interest and importance. The diseases which most frequently occur in armies on active service are considered according to their causes, in the first rough sense of that word. Thus they are referred to as effects of overcrowding, of climate, of privation, of fatigue, or of youth and age. The most important diseases of the first group are erysipelas, hospital gangrene, typhus, yellow fever, and cholera. The mortality from erysipelas and hospital gangrene should, the author says, be ascribed to wounds, of which accidents they are the only too frequent consequences. It is a well-known fact that deaths from wounds and these secondary diseases are, as Mr. Martin reminds us, "much more numerous than those from slaughter in the field." It seems possible, however, that much may be done in the future to diminish the frequency of these dreaded *sequela* by the more thorough, early, and complete adoption of such antiseptic methods of treatment as may be found available or possible on the battlefield, or in the often too crowded camp hospital. To check the occurrence of putrefaction in and about wounds is now universally recognized as of prime necessity for the achievement of such a result. And this unanimity in regard to one of the principal practical aims in the treatment of wounds is all the more fortunate since the recognition of its importance affords a meeting-point for those who on the side of theory are in complete opposition as to the actual order or series of the causal agents concerned in the production of such diseases as erysipelas, pyæmia, or septicæmia.

Of the other chief diseases in armies which result from or are attendant upon overcrowding (namely, typhus, yellow fever, and cholera) by far the most important is typhus. The history of the effects of this one disease on military operations affords some remarkable facts to which the author calls particular attention. It has always been the scourge of Continental armies. Yellow fever has not to anything like the same extent influenced

\* *Contributions to Military and State Medicine.* By John Martin, Surgeon, Army Medical Department. Vol. I. London: J. & A. Churchill. 1891.

the operations of actual warfare, and its ravages have, moreover been experienced by navies rather than by armies. Cholera, however, is of much more importance, especially within its endemic area, since it has many times greatly reduced the strength of our Indian army.

The second essay is one of considerable importance. It deals with the subject of "The Influence of Drinking Water in originating or in propagating Enteric Fever, Diarrhoea, Dysentery, and Cholera." These are problems of considerable difficulty and complexity, and though their solution is of great moment professional opinion in regard to them is, for the most part, still in a very unsettled condition. The author is fortunately a logical thinker, and he handles his subject in a very methodical manner. He is apparently well qualified to take a general survey of the evidence available in regard to the ætiology of these important diseases which so frequently appear in epidemic fashion. As the title of his essay implies, Mr. Martin shows himself fully alive to the possibility that communicable diseases are still being originated as well as propagated, and throughout his essay he strongly insists upon the necessity of looking at evidence as to the production of such diseases from this double point of view. Practically, too, this search for cases of *de novo* origin may be of considerable moment; for, as Mr. Martin says, "If such cases do not occur, then our efforts should be directed against the propagating causes; if they do occur, we should endeavour to counteract the originating cause; and if this object be attained, the propagating cause will cease to exist." His own view as to the existence of such cases is expressed in no hesitating terms. He says:—

I think most persons, after due consideration and a careful study of epidemics, will agree with me in believing not only that such original cases do now occur, but also that they are of frequent occurrence; and, moreover, that propagation holds a secondary place in epidemics. . . . An objector may reply by pointing to our improved sanitation, and the lessened mortality of epidemic disease, as cause and effect. But this is no valid objection unless he prove that sanitary improvements have operated solely against propagation, and have not influenced the origination of disease.

The author enunciates and defends the position that "specificity of a disease does not necessarily imply specificity of its cause." He thinks that non-specific phenomena may occasionally be instrumental in initiating a specific disease, although such specific disease may subsequently be propagated by specific agents (contagia). He points out, also, that a corollary of this doctrine—namely, that specificity of cause does not imply specificity of disease—is a principle worthy of more consideration than it has hitherto received, and he thinks that even now important evidence is not wanting to show that the same cause acting upon different organisms, either of the same or of different species, may lead in them to the evolution of what are usually considered to be totally distinct diseases. This corollary Mr. Martin only refers to here and there incidentally, but the main doctrine is fully considered in regard to each of the diseases concerning which he writes. It is in respect to diarrhoea, dysentery, and cholera that he has most of positive evidence to bring forward concerning their multiple and independent modes of origin. His discussion of the ætiology of the second of these diseases, so far as it is influenced by drinking water, is particularly able, and affords a good example of the complexity of the problems involved in such a question, and of the enlightened mode in which the author considers them. Though it is in these diseases that he finds so much evidence of origination as opposed to propagation, he is of course quite prepared to admit that cholera is not unfrequently propagated through the medium of drinking water.

The evidence in regard to the actual *de novo* origin of enteric or typhoid fever is not so positive or so generally admitted as that which relates to the other disease. Pathologists in this country have long ranged themselves into two opposite camps in regard to this question; and it is not here only that doubt exists:—

The Continental schools are divided in an exactly similar way as regards this postulate. Pottenkofer, Ranke, and Wolfsteiner range themselves with Murchison, believing that the disease sometimes arises from causes independent of a foregoing case, as well as sometimes by contagion; while Gietl and Friederich believe, with Budd, that a prior case is necessary, and refuse the postulate assumed by the others. It matters little, however, whether they refuse it or not, since it is granted by common sense and by experience. Murchison and his school believe in the origin and propagation of disease; while Budd and his school believe only in the propagation, and do not acknowledge any origin for specific disease.

It is clear from this passage to which school Mr. Martin belongs. He boldly protests against the general view supported by Sir Thomas Watson, that if this disease be once proved to be propagated by contagion, such a fact should of itself instil grave doubts as to its ever being originated *de novo*. He contends that this as a general principle is illogical. Fire may spread from object to object, so long as the objects attacked are inflammable and more or less contiguous; no one, however, supposes that fire may not be originated as well as propagated. On the same principle he contends, and we thoroughly agree with him, that it is unwise to assume that contagia which may be propagated may not also originate. Nay, further, some of those who hold the contrary view in regard to the contagia of typhoid fever, are by no means prepared to admit the same principle in regard to the commoner contagia of erysipelas. But it is on the ground of experience, so far as it goes or can go in the settling of such a question, that Mr. Martin in the main relies, and especially experiences of typhoid fever as it occurs in India. Here, he says, overwhelming evidence is to be found against the exclusively contagionist doctrines of

Budd and his followers. More instances of origination than of propagation of typhoid fever are, he believes, to be met with in India. To some extent, therefore, the same kind of thing obtains in regard to this disease as in regard to cholera; India is a sort of hot-bed favourable to its birth. It is not, however, so exclusively favourable as it would appear to be for cholera, which, according to the conclusion of the International Sanitary Conference at Vienna in 1874, "arises spontaneously only in India, and reaches other countries from without." Mr. Martin dwells upon evidence existing as to the diffuse and sporadic appearance of typhoid fever in India, especially at certain times and seasons, as may be gathered from the Indian Sanitary Reports, and he calls particular attention to the widespread outbreak of this disease in India during the last ten days of August 1872, when almost every military station, over several enormous areas, began to report cases of this fever. He adds, that it was not only typhoid fever which came forward at this period, "but purely climatic fevers of every variety, and while the exciting cause of all was the same, the type varied according to predisposition and special circumstances." This simultaneous outbreak of typhoid fever over wide areas in India is all the more important inasmuch as the distribution of the disease, according to our author, does not seem to be at all distinctly related to the course of rivers. This point he has ascertained by careful inquiries concerning many epidemics of typhoid fever in India. "The value of this observation," he adds, "can hardly be rightly estimated by persons who have not studied the phenomena of epidemics in tropical climates," where the water supply is not artificial, but in which "the population use streams largely for drinking purposes (as in the outer Himalaya)." The author himself holds certain opinions, necessarily crude and tentative, as to the mode in which typhoid fever is actually engendered in the human body; but, as he sees clearly enough, the truth or falsity of these opinions does not affect the more general question. On several points of detail we are not inclined to agree with Mr. Martin. We cannot, for instance, accept his view as to the foundation on which the germ theory of disease has been based; nor do we think that some of the limitations which he has imposed upon the scope of his inquiry are of such slight importance as he imagines. The explanation (p. 95) that, according to the "physico-chemical theory" of the origin of certain contagious diseases, "the minute organisms found in the tissues after death are the causes and not the results of pathological change," is probably the printer's, rather than the author's, view of the matter. The essay, however, is one which does credit to its author, and it will usefully serve as an antidote to the narrow and exclusive doctrines concerning contagious diseases which are now only too prevalent. The author's conclusions are drawn throughout with the greatest care and moderation; and it is evident that he is not only an accurate thinker, but also one who has had considerable experience bearing upon the ætiology of the important diseases to which he has directed his attention.

#### THE CAMERONIANS.\*

IN the first volume of this book we are introduced to Sir Piers Montgomerie, Bart., a retired general officer, who is also G.C.B. and G.O.S.I., Colonel of the 26th Regt. (The Cameronians), and Governor of Dumbarton Castle. He is at breakfast, the rest of the party consisting of his remote kinsman and heir, Hew Montgomerie—of the Indian Civil Service, home on a year's leave—his grandniece and orphan ward, Mary Montgomerie, her friend, Annabelle Erroll, and an old lady, Mrs. Garth, Mary's governess and friend. Sir Piers is a fine, fresh old gentleman nearing his seventieth year; is by nature generous, but peppery and proud. Hew Montgomerie is about thirty years of age, "a sharp hand at cards and with a brilliant cue, deeply in debt, and with the current reputation among his set of being a bad lot." The Baronet, taking up the *Ayr Observer*, learns that a detachment of the 26th Regiment has arrived at the Castle of Dumbarton, under the command of Lieutenants Cecil Falconer and Leslie Fotheringham. He instantly makes up his mind to invite the senior Lieutenant, Falconer, to his house for a few days' cover shooting. Hew does his best to dissuade the Baronet from carrying out this intention; but the latter persists, and after a short interval we find Mr. Cecil Falconer installed as an honoured guest at Eaglescraig, and already become a prime favourite with the General and the ladies. Hew and he, however, do not at all hit it off, and indeed a mutual dislike was discovered at their first meeting. Cecil and Mary Montgomerie contrive, without contriving, to see a good deal of each other, with the result that he falls very much in love. He then makes the unpleasant discovery that the object of his affections is bound by the terms of her father's will to marry her cousin Hew, or, in default, lose all her money. The cousin seems to have entered thoroughly into the spirit of the father's testament; but, even before the advent on the scene of Cecil Falconer, the young lady has shown plainly enough that she would sooner lose her money than accept the imposed husband. Mary is a lovely girl, frank and open-hearted in disposition, and she sings well. Annabelle sings well, too, and Falconer is also musically inclined, so the evenings are often spent at the piano. When the Baronet and the ladies retire for the night, Hew takes Falconer to his room, and they play *scotch*. The result is so one-sided that,

\* *The Cameronians*. By James Grant, Author of "The Romance of War," &c. 3 vols. London: Richard Bentley & Son. 1881.

after losing all his disposable cash, Falconer is constrained to apply to his friend and brother-officer Fotheringham for 180*l.*, in order to meet an I.O.U. given to his opponent; and the friend, better circumstanced than some lieutenants are, is able to forward the sum by return of post. Falconer pays Hew, and resolves to see a little more of his adversary's sciences. A pet dog belonging to Mary, unknown to the players, watches the play also, and comes to Falconer from under the table with a card in his mouth. Thereupon Falconer looks under the table, and sees several discarded cards. Hew denies having dropped them, but Falconer declines to play again. Afterwards Hew goes away on a visit, and on his return discovers Cecil and Mary in a grotto engaged in tender exchanges following on a proposal and avowal. This is too much for Hew, who, filled with rage and jealousy, determines to ruin Falconer in the estimation of his host. He tells him the guest is of no family, that his mother is an opera singer or dancer, and that he is in the habit of dropping his cards at *carté*. The Baronet waxes wrathful, but, as Falconer is to leave on the morrow, says nothing, and contents himself with extending to him a cold good-bye. The Baronet had a horror of misalliances. His only son had married a painter's daughter in Italy, and, aware of his father's infatuated pride of family, was afraid to bring her home, his father giving vent to the genial sentiment "May the moment that I forgive you and her be my last on earth." The son died, and the Baronet's watchfulness was transferred to his ward, and Falconer he now watches from a distance. "And he set a watch to watch them, and Sir Aylmer watched them all." Unhappily for his views, he takes his family to Edinburgh, hoping that change of scene may make his charge forget the Falconer incident; but the Cameronians happen to move into garrison at the northern capital about the same time, and love, which laughs at bolts and bars, finds ways of bringing the lovers often together.

Hew, whose own chances, he is now well aware, are gone, if they had ever existed, knows of these meetings, but bides his hour of revenge. A ball is given by the Cameronians; and, while Falconer and Mary Montgomerie are dividing their attentions between each other and supper, Hew manages, unperceived by either, to drop some powder into Falconer's glass. The latter finishes the contents of the glass at a draught, forthwith becomes deadly pale, then makes a wild clutch at the table, but falls with a crash on the floor. He is borne away, and the next morning the adjutant of the regiment informs him he is under arrest, having been drunk and incapable at a public entertainment. A court-martial follows, with the result that Lieutenant Cecil Falconer is "dismissed generally, not specifically," Her Majesty having no further occasion for his services. Kindly Mrs. Garth escorts Mary to see him before he leaves the regiment, and then he says no word to any one, but departs. When next we hear of him he is on the banks of the Morava. Servians and Russians are both loud in their praises of a gallant but nameless volunteer who has saved the life of General Tcherniaeff and his aide-de-camp Count Palenka. This is no other than our luckless hero, who is striving to forget his misery in the excitement of a campaign. Meanwhile Mary is disconsolate, of course, and so is her friend Annabelle, who has become engaged to Fotheringham and believes him to be trifling with her.

Soon after Falconer's dismissal the Baronet's lawyer informs Sir Piers that he has discovered, though young Piers and his wife are both dead, that they left a son who joined the Cameronians under the name of Cecil Falconer. The childless old man is overjoyed to learn the existence of a grandson, and becomes all anxiety to ascertain his whereabouts. Mary is gladdened to the extent of thinking it must be a dream that Cecil is her own cousin, the lawful heir of Eaglescraig, the man foreappointed to be her husband, and that Hew, the pretender, is scarcely even a cousin by Scottish reckoning. Falconer is informed of the extraordinary turn affairs have taken at home, but the intelligence does not reach him until after he has made his name of "British Volunteer" famous throughout the Russo-Servian army, and until he has several times almost succeeded in getting killed. Then he comes home, the proceedings of the court-martial are quashed, Eaglescraig *en fête*, Annabelle discovers that Fotheringham means all he says, and everybody, excepting Hew, lives happily ever afterwards.

The title of the book led us to expect that the story would be more or less connected with the 26th or Cameronian Regiment as a regiment; but we see no particular reason why, with a change in one or two names, the novel might not have been headed, with equal appropriateness, the "Sherwood Foresters" or the "Pompadors." The preface of the book led us to expect that the author, who "by a correspondence with Mr. Childers in March last was fortunate enough to secure the royal yellow of Scotland for all Scottish infantry not faced with blue," would introduce his own or somebody else's—perhaps his hero's—opinions upon the impending changes in regiments, and the effect these will have upon uniform, if not upon *esprit de corps*. However, the author winds up by saying, "Of the merits of the new regimental system it is difficult to speculate as yet; but it will too probably create an endless confusion, and be long a source of regret to the entire army." After this we anticipated finding the merits of the old system exposed, or, at any rate, some argument in the course of the narrative which would allow us to believe that the story bore an appropriate title. The court-martial which tries and condemns Captain Falconer is certainly not a model tribunal. The president, we are told, was a "cranky old colonel," and presidents are sometimes cranky; but we doubt if it is the ex-

perience of any officer that the crankiest of them allow members of the court to prescribe the order of the proceedings and usurp their functions. A certain Brevet-Major Raunner is distinctly irregular on several occasions. He orders the court to be cleared, and lays down the law dictatorially. Then another member shouts "Clear the court!" "What utter stuff this is," said Falconer to the Adjutant, as they smoked a cigar outside, while the fourteen members of the court, the president, and the deputy-judge advocate seemed to be all speaking and wrangling at once; and after some twenty minutes' deliberation the court was re-opened and all the audience trooped in again." What business Major Raunner and other individual members, especially when the prisoner was present, had to expound the law when the deputy-judge advocate was there authoritatively to interpret it, we are unable to say. It is certainly a novel way of managing matters; but then this court-martial is the tribunal of a novel. We may mention, in passing, that Captain Falconer owed much of his popularity amongst the men of his corps to the circumstance of his having, when commanding an advanced piquet before the enemy, despatched an omitted to report one of his sentries whom he found asleep on his post, which, moreover, was one of great importance. He contented himself with shouldering the man's piece, and doing the duty himself. In order to show up Falconer's magnanimity (by the by, that officer was neglecting his own proper work), the gravity of the occasion is further insisted upon, for on the enemy advancing, the duty of firing the first shot and alarming the piquet devolved on Falconer himself, *vice* his sentry sound asleep. Probably he thought he could not do better than follow Suwaroff's conduct on a like occasion, but he should have been tried by court-martial all the same. Those who would instruct the public on things military should first of all explore the ground thoroughly themselves.

On the whole, *The Cameronians* is a very readable novel. The ladies are interesting, the hero is a brave man and a good; the "ruffian of the piece" is an out and out scoundrel, but then he lost a beautiful wife, a large fortune, and a "desirable demesne." The story of his having drugged his rival's wine at supper in the middle of a crowded ball is so grossly improbable that we may charitably hope there was some mistake. For those who appreciate what are popularly designated as "sells" there is a brilliant specimen in the book before us. After Cecil Falconer had left his regiment, and when the Piers family lawyer had discovered the relationship existing between that gentleman and Sir Piers, it was suggested that advertisements should be inserted in the papers with a view of ascertaining Falconer's whereabouts; "but," we are told, "poor Cecil was now *where no advertisements would ever reach him*." Who would suppose that Cecil was elsewhere than in his grave, or at the least in the region of Timbuctoo? As a matter of fact he was engaged in the Servian war with Turkey, had acquired considerable reputation, and was in the company of other Englishmen who received both letters and newspapers in the ordinary course of post. As it happens, it is through the medium of an advertisement in the *Times* that he is discovered.

## NOTICE.

We beg leave to state that we decline to return rejected Communications; and to this rule we can make no exception.

	Contributions to Military and State Medicine.
	The Cameronians.

London: Published at 38 SOUTHAMPTON STREET, STRAND, W.C.

## ADVERTISEMENTS.

DORÉ'S GREAT WORKS, "CHRIST LEAVING the PRÆTORIUM," "CHRIST ENTERING JERUSALEM," and "MOSES BEFORE PHARAOH," each 32 by 24 feet; with "Dream of Pilate's Wife," "Christian Martyrs," &c. at the DORÉ GALLERY, 30 New Bond Street. Daily, Ten to Six. Is.

**UNIVERSITY COLLEGE, LIVERPOOL.**  
The Council of University College, Liverpool, are prepared to appoint a PROFESSOR to each of the following Chairs:  
1. Modern Literature and History.  
2. Natural History (including Zoology, Botany, and Geology).  
3. Logic, Mental and Moral Philosophy, and Political Economy.  
The work of each Chair will commence in January 1882. The stipend of each Chair will be £500 per annum, together with two-thirds of the fees, the total stipend being guaranteed to be not less than £400 per annum.  
Candidates are requested to send in their applications, and copies of their testimonials, to the Honorary Secretary, not later than November 1, 1881.

W. J. STEWART, Hon. Sec.  
25 Lord Street, Liverpool.

**UNIVERSITY COLLEGE, LIVERPOOL.**  
LECTURERS in FRENCH and GERMAN are REQUIRED, who will be expected to commence work not later than the middle of January next. The fixed salary will be £1,000 per annum, but the Lecturers will receive the whole of the fees paid by the Students attending their classes, and will be at liberty to undertake Private Tuition.  
Applications, with testimonials, to be sent in by November 15, to the HON. SECRETARY of University College, 25 Lord Street, Liverpool.

**THE Rev. J. H. CROSS, M.A.,** receives a small number of GENTLEMEN'S SONS to prepare for the Public Schools. High testimonials. Great advantages. Address, 31 Sussex Square, Brighton.

**MILITARY and CIVIL SERVICE EXAMINATIONS.**  
There is a Department in connexion with HILAIR LODGE SCHOOL, HOLMONT STATION, Strlingshire, for preparation for the above Examinations. Pupils gained during the past year. Three appointments to Woolwich Academy. Seventh Place for Indian Civil Service, &c. &c. Full particulars on application to the HEAD-MANTR.

**WOOLLEY GREEN, near HURSLEY, HANTS.**  
A. M. HEATHCOTE, B.A., Oriel Coll., Oxford, prepares YOUNG BOYS for Public Schools, &c. Number under Twenty. Two Resident Assistant-Masters. The house is quite in the country, and in a healthy position. Full particulars on application. Address, Woolley Green, near Hursley.

**TUITION at ST. LEONARDS-ON-SEA.** A Married CLERGYMAN (M.A. Oxon), without family, has vacancies for PUPILS to prepare for Public Schools or Universities. All former Pupils have passed successfully. Only Three received. Comfortable home a few minutes from the Sea. Highest references. Address, Rev. R. HOWARD, 7 Church Road, St. Leonards-on-Sea.

**PREPARATORY SCHOOL for SONS of GENTLEMEN, ST. LEONARDS-ON-SEA.** Situation most healthy; sanitary arrangements perfect. Special care of delicate or very young boys. References to Parents of Pupils. For Prospectus address, Rev. W. HARRIS, Falkland House, St. Leonards-on-Sea.

**FOKLESTONE.** Mr. W. J. JEAFFRESON, M.A. Oxon, assisted by a Cambridge M.A. and competent Teachers, prepares PUPILS for the Universities of Cambridge, Sandhurst, and all competitive Examinations. A few vacancies.

**AMESBURY HOUSE, PAGE HEATH, BICKLEY, Kent.**  
Rev. EDMUND FOWLE, Author of a very successful Series of Latin and Greek School Books, receives THIRTY-THREE BOYS, under the age of Fifteen, to prepare for the Public Schools.

**HIGH-CLASS TUITION, the UNIVERSITIES, ARMY, &c.**  
Mr. H. M. HEWITT, M.A., Double First in Honours (Cambr.), has accommodation for select RESIDENT PUPILS. Address, 31 The Cedars, Putney, S.W.

**THEOLOGICAL, UNIVERSITY, MILITARY, CIVIL SERVICE, and other EXAMINATIONS.** PUPILS rapidly and successfully prepared. Terms moderate. Highest references. Address, Rev. W. H. ROWLANDSON, Great Linnet, Witham.

**HYDE PARK COLLEGE for LADIES, 115 Gloucester Terrace, Hyde Park.**  
The SENIOR TERM begins November 1.  
The JUNIOR HALF-TERM, November 1.

Prospectuses, containing Terms, Names of Professors, &c., may be had on application to the LADY RESIDENT.

**EDUCATIONAL HOME for the DAUGHTERS of GENTLEMEN.** THE GRANGE, Enderinch, NONN-ON-THE-RHINE, Germany. Number of Pupils limited to Twelve. Refined English home. Resident North German and Parisian Governesses. High-class Masters for accomplishments. Unexceptionable references. Apply as above, to the Directress, Mrs. BARNHART.

**TO PARENTS and GUARDIANS.—DOMESTIC ECONOMY.**  
A Married LADY, of good position, and experienced in every detail of Household Management, takes YOUNG LADIES, after completing their scholastic education, who desire to learn practically the Arts of COOKERY, DRESSMAKING, and GENERAL HOUSEWIFERY. She offers a genuine Home, with every hygienic advantage. The Daughters of professional gentlemen preferred. Terms, 100 Guineas per annum. References given and required. Address, Rolandsbeck, Edgbaston, Warwickshire.

**HAMPSTEAD.—SOUTH HILL PARK GARDENS,** within five minutes of Hampstead Heath Station, N. London.—TO BE LET or SOLD, a Freehold Double-fronted HOUSE, containing fourteen rooms, also bath-room, with a constant supply of hot and cold water. Reception and bed rooms most conveniently arranged. Domestic offices on ground floor; good garden at the rear. The house is in thorough repair and most pleasantly situated. For particulars apply to Mr. DOLMAN, House Agent, 68 Haverstock Hill, and 60 Queen Victoria Street, E.C.

**HYERES.—TWO GOOD VILLAS** (Eleven and Six Bedrooms) TO LET. Best sanitary arrangements. Address, S. English Bank, Hyeres.

**CONSOLS versus GROUND RENTS.** Consols pay 3 per Cent. Freehold Ground Rents, equally safe, pay 4 to 4½, and constantly increase in value. Descriptive Paper gratis. Sixty Lots for Sale.—Messrs. BREWER, 36 London Wall, E.C.

**PENINSULAR and ORIENTAL STEAM NAVIGATION COMPANY.**

UNDER CONTRACT FOR HER MAJESTY'S MAILS TO INDIA, CHINA, and AUSTRALIA.

REDUCED RATES OF PASSAGE MONEY.—SPECIAL RETURN TICKETS.

Departures for—  
BOMBAY, CALCUTTA, MADRAS, CEYLON, Fortnightly } From Gravesend,  
CHINA, STRAITS, JAPAN, " } Wednesday, 11.30 P.M.  
ADELAIDE, MELBOURNE, SYDNEY, " } From Brindisi,  
GIBRALTAR, MALTA, EGYPT, ADEN, " } Monday.  
above departures, Weekly, by each of the  
LONDON OFFICES: 125 LEADENHALL STREET, E.C., and  
25 COCKSPUR STREET.

## HOTELS.

**BRIGHTON.—BEDFORD HOTEL.**—Facing Sea and Esplanade. Near the West Pier. Central and quiet. Long established. Suites of Rooms. Spacious Coffee-room for Ladies and Gentlemen. Sea-Water Service in the Hotel. BENJN. BULL, Manager.

**ILFRACOMBE HOTEL.**—On the verge of the Atlantic, in the own Grounds of Pils. Acres, with Tennis Lawn. Contains 200 Rooms, and is "a model of sanitary excellence." One of the largest Swimming Baths in England; also Private Sea-water Baths.—Every information of MANAGER.

**TOTLAND BAY, Isle of Wight, near Alum Bay.—TOTLAND BAY HOTEL.** Magnificent sea views. Comfort, with moderate charges. Billiard-room and tennis lawn. Bracing air. Excellent sands and promenade pier. Good anchorage for yachts. Special train and boat service, Friday, 3.10 P.M., returning Monday, 7 A.M. Apply to Miss FLEMING, Managers (late of the Langham Hotel).

**BEDFORD HOTEL, BRIGHTON.—FAMILIES or GENTLEMEN** intending to visit the Hotel are respectfully solicited to address their applications for rooms as early as possible, the Manager being very desirous of not disappointing his esteemed patrons.

THE "BIG J" PEN and THE "BIG WAVELET" PEN, 4d. and 1s. per box.  
Sold by all Stationers throughout the World.  
1,745 Newspapers recommend Macniven & Cameron's Pens.  
They come as a boon and a blessing to man.  
The Waverley, the Owl, and the Frodo Pen.  
Specimen Lists, all kinds by post 1d.  
PATENTERS: MACNIVEN & CAMERON, 25 to 28 Blair Street, Edinburgh.  
Penmakers to Her Majesty's Government Offices. (Bd. 1776).  
Beware of the party offering imitations of these Pens.

## HUNYADI JÁNOS.

*"The Best Natural Aperient Water."*  
LONDON MEDICAL RECORD.

*"Speedy, Sure, and Gentle."*

Professor ROBERTS, M.D., F.R.C.P.

Recommended by Professors VON LIEBIG, VIRCHOW, AITKEN, MACNAMARA, SILVER, &c. &c. &c.

The name of the "APOLLINARIS COMPANY, LIMITED," on the Label secures genuineness.

Of all Chemists and Mineral Water Dealers, at 1s. 6d. & 2s. per bottle.

THROAT  
IRRITATION  
AND  
COUGH.

**SORENESS and Dryness, Tickling and Irritation, including Cough, and affecting the Voice.** For these symptoms use Eppe's Glycerine Ju-Jubes. Glycerine, in three agreeable confections, being in proximity to the glands at the moment they are excited by the act of sucking, becomes suitably healing. Sold only in Boxes, 7½d. and 1s. 1½d., labelled "JAMES EPPE'S & CO., Homoeopathic Chemists."

Extract from a letter addressed to JAMES EPPE & CO.: "Gentlemen,—It may, perhaps, interest you to know that, after an extended trial, I have found your Glycerine Ju-Jubes of considerable benefit (with or without medical treatment) in almost all forms of throat disease. They soften and clear the voice. Yours faithfully, GORDON HOLMES, L.R.C.P.E., Senior Physician to the Municipal Throat and Ear Infirmary."

## IMPROVED SPECTACLES.

**MR. HENRY LAURANCE, F.S.S., Oculist Optician,** PERSONALLY adapts his Improved Spectacles at his residence, 3 Endeavour Gardens, Euston Square, London, daily from Ten till Four (Saturdays excepted). Testimonials from Sir Julius Benedict, Dr. Radcliffe, Physician, Westminster Hospital; Ven. Archdeacon Palmer, Clifton; Major Gen. Spurgin, C.B., Aldershot; the Rev. Mother Abbes, St. Mary's Abbey, London; and hundreds of others, in Mr. LAURANCE's pamphlet, "Spectacles: their Use and Abuse," post free.

**FURNISH YOUR HOUSE or APARTMENTS THROUGHOUT on MORDEN'S HIRE SYSTEM.** The original, best, and most liberal. Cash Prices; no Extra Charge for time given. Large, useful Stock to select from. Illustrated priced Catalogue, with Terms, post free.—248, 249, and 250 Tottenham Court Road, and 19, 20, and 21 Morwell Street, W. Established 1862.

## DECORATION.

**MORANT & CO.,** having for many years carefully studied the best periods of Decorative Art, and having had great experience in carrying out important orders, will advise upon the DECORATION and FURNISHING of TOWN and COUNTRY HOUSES, prepare Designs, and execute the necessary works at moderate cost. MORANT & CO. personally superintend all work entrusted to them.

91 NEW BOND STREET, W.

HINDLEY'S  
CHINTZES.

ORIGINAL DESIGNS, FAST COLOURS.  
From 3d. per yard.  
WALL PAPERS and CURTAIN STUFFS.  
C. HINDLEY & SONS,  
290 to 294 1/2 OXFORD STREET, W.

**INVALID FURNITURE.**—Wicker Bath Chairs, £2 2s.; Invalid Adjustable Couches and Beds, from £5 5s.; Excreting Chairs, with horse action, from £5 5s.; Carrying Chairs, £3 10s. 6d.; Reclining Board, £1 5s.; Trapped Commodes, £1 5s.; Perambulators, £1 5s.; Leg Rests, £1 10s.; Back Rests, 12s. 6d.; Merlin Chairs, £3 10s.; Bed Tables, from 12s.; &c. Descriptive Catalogues post free.  
J. CARTER, 6A New Cavendish Street, Great Portland Street, W.

**BREAKFAST in BED.—CARTER'S PATENT REVOLVING BED TABLE,** adjustable to any height or inclination for reading and writing. Price from £3 5s. Descriptive Catalogues post free.  
J. CARTER, 6A New Cavendish Street, Great Portland Street, W.

**FIRESIDE COMFORT.—CARTER'S LITERARY MACHINE.**—For holding a Book or Writing Desk, Lamp, Maps, &c., in any position, over an Easy Chair, Bed, or Sofa, obviating the fatigue and inconvenience of incessant stooping while reading or writing. Invaluable to Invalids and Students. Admirably adapted for India. A most useful gift. Prices from 5s. Descriptive Catalogues post free.  
J. CARTER, 6A New Cavendish Street, Great Portland Street, London, W.

WILLS'  
BEST BIRDSEYE.

By the Courtesy of the  
FRENCH GOVERNMENT  
Is now sold at the  
Bureau of Grand Hotel, Paris.  
W. D. & H. O. WILLS.

**CHRISTMAS PRESENTS.**—Nothing is so highly appreciated as a case of GRANT'S MORELLA CHERRY BRANDY, which can be ordered of any Wine Merchant. Queen's quality, as supplied to Her Majesty, 4s. per dozen. Sportsman's special quality, 5s. per dozen.—Manufacturers, T. GRANT, Distillers, Maldores.

**DINNEFORD'S MAGNESIA.**—This pure Solution is the best remedy for Acidity of the Stomach, Heartburn, Headache, Gout, and Indigestion.

SPEECHES OF THE WEEK.

**T**HERE has been a perfect deluge of speaking, and especially of Ministerial speaking, during the present week. Mr. GLADSTONE himself has again appeared on the scene, and Sir WILLIAM HARCOURT and Mr. CHAMBERLAIN have been delighting or astonishing gatherings of enthusiastic Liberals at Glasgow and Liverpool. These extra Parliamentary meetings are a godsend to many Parliamentary speakers. Not only are they brought into exceptional and exclusive prominence, but they have an opportunity of speaking as they can speak at their best. Sir WILLIAM HARCOURT is far more effective when addressing a sympathetic audience and allowed to treat any subject in any order and in any manner he pleases than when he has to confine himself to the topic under discussion in a House of Commons which he sometimes commands, but seldom if ever fascinates. At Glasgow he showed that, in circumstances that suit him, he is in his own style one of the most telling and pointed speakers of the day. He can be by turns cheerful, playful, solemn, and sublimely moral. His business was to defend the Government to which he belongs, and to cry down the party which he largely contributed to eject from power. He defended the Government by showing that it has been guided by an almost superhuman wisdom, and has invariably acted on the noblest principles; and he cried down his opponents by showing that they never did wise things and always said foolish things. Sir WILLIAM HARCOURT is the fighting leader of the Liberals, as Lord SALISBURY is the fighting leader of the Conservatives, and lookers-on may be content to recognize that each has fought very well for his side. Mr. CHAMBERLAIN went to Liverpool not so much to speak on political subjects as to reveal himself to Liverpool and to the world. He felt that it would be interesting to a large number of people to know what Mr. CHAMBERLAIN thought, what he was doing, and what he intended to do. As Mr. CHAMBERLAIN is a rising man in a rising party, it is undoubtedly a matter of some moment to know what he thinks and what he is aiming at. The first impression which his revelations produce is that office has done him good, and that as an official he is a man of many ideas and indefatigable energy. He confessed, with commendable candour, that he entered office with an entirely wrong set of ideas as to what the inside of official life really was. He expected to find the Board of Trade a nest of red tape, pedantry, and obstinacy, and he found that it was permanently governed by a set of zealous, unformal, and enlightened officials. He has also been taught by office that there are things in the world which reformers out of office assume that Government can do with perfect ease if the necessary powers are given it, and which reformers in office find a Government totally unable to accomplish. He announced the painful discovery that the efforts of the Board of Trade to work out the scheme created for it by Mr. PLIMSOLL had ended in a total collapse. It cannot stop unseaworthy vessels from going to sea, and it cannot procure the conviction of those who send unseaworthy vessels to sea. In despair he is moulting a plan for coaxing shippers into superintending themselves. Office, too, has carried Mr. CHAMBERLAIN so far into the theory of general politics as to make him realize that occasionally it may be the duty of a Liberal Government to support law and order; and it has forced him to bring home to his mind the inevitable consequences of the separation of

England and Ireland. It has also made him look the facts of current life in the face, and has taught him to describe with accuracy what has really taken place. With a frankness which other members of the Cabinet have not ventured to imitate, he pictured the Land League as an organization, not only innocent, but most salutary and even indispensable, while the Government was engaged in carrying the Land Bill, and as an organization pernicious and lawless when it tried to thwart the measure which the Government had carried. This really represents the way in which the Government has dealt with the Land League; and it is much more to the purpose to say this frankly than, like Mr. GLADSTONE, to dwell time after time on arguments which show that Mr. PARNELL differs from another Irish leader who agitated forty years ago, and whom Mr. PARNELL has never professed to imitate.

Among the secondary speeches of the week there have been two at least of great merit. Mr. PLUNKER has given the views on Ireland of a moderate, just, and very intelligent Conservative; and the Duke of SOMERSET has made a serious attempt to bring the vague theories which are beginning to group themselves round the question of Land Reform in Great Britain to the only satisfactory test—the test of facts. It was not only the truth of what Mr. PLUNKER said in answer to Mr. GLADSTONE's charge against the Irish landlords that they had not done their duty, but the calm, courteous, reasonable way in which he disposed of the charge, that commanded attention. With regard to the land question on this side the water no two speakers could have approached the subject in a manner more totally different than Mr. CHAMBERLAIN and the Duke of SOMERSET. The subject of English Land Reform has not yet come within Mr. CHAMBERLAIN's official range. He consequently looks at it in what may be termed his native way. He is a Radical leader, thinking how Land Reform may be fitted into the Radical programme. He disposes of it with a sweeping assertion, and looks to it for a political cry. He comes to be a Minister, and lapses into the Birmingham wirepuller. First of all, he announces that a sweeping measure of Land Reform is almost, if not quite, as necessary in Great Britain as in Ireland. He then considers how the sweeping measure is to be carried, and he has come to the conclusion that it can only be carried by a Parliament which the agricultural labourer has had a large share in returning. But, if the newly-enfranchised labourer is to vote straight, he must have something to gain. Something very big, comfortable, and attractive must be done for the agricultural labourer. The ostensible opinion entertained of the agricultural labourer is that he is so well educated, so honest, and so intelligent, that he fully deserves a vote. The real opinion entertained is that the labourer, with all his education, honesty, and intelligence, is almost certain to vote wrongly unless he is handsomely bribed. The grave social and constitutional dangers of treating the agricultural labourer in this way are too apparent to need any extended notice; but it may be observed that this appeal to the interests of the agricultural labourer is merely a form of Fair-trade or Protection. It is quite consistent with Free-trade to do anything the law can do to make agriculture a trade as thriving as it can be in the face of full competition, and to leave the labourer to make the best terms he can in a rising market. It is simply Protection to place the labourer in an advantageous position artificially created for him at the cost of the State or by

taking away the property of other people. And generally on the subject of Free-trade Mr. CHAMBERLAIN seemed to be not altogether coherent and not altogether fair to his opponents. Sir STAFFORD NORTHCOTE no doubt looked on Fair-trade too much from the point of view of a man who had to manage his party, and too little from the point of view of a man who had to guide and instruct his party. But Lord SALISBURY spoke out as distinctly in favour of Free-trade as is possible when a Free-trader is prepared to accept Treaties of Commerce. If a nation wishes for a Treaty of Commerce, and cannot get it by negotiation, whether the best way to get it is by waiting patiently until negotiating can be resumed, or by putting high duties on luxuries imported from the country with which the treaty is to be made, is a question of expediency, not of principle.

Mr. CHAMBERLAIN passed into his official vein when he spoke of the Treaty of Commerce with France, which he hoped would soon be concluded. He was delighted with the part the Board of Trade had taken in the preliminary discussion, with its activity, its zeal, its knowledge, and with the immense services it had rendered to the Foreign Office. Since he became its head the department, as he said with ingenuous pride, has deserved to be called a Ministry of Commerce rather than a mere Board of Trade. All these efforts seem now about to be crowned with success; and Mr. CHAMBERLAIN is pleased because he wishes to have a Treaty of Commerce with France, and he wishes to have this treaty because he thinks it will promote friendly relations between the two countries. This is the real justification for a treaty. It is politically expedient, not financially just. If English woollen goods are imported into France which would not otherwise be imported, and the drinkers of French wine get it cheaper because the duties are lowered, the payers of those taxes which must be increased to make up the loss to the revenue give a bonus to the exporters of woollen goods and the drinkers of French wine. In return, they get all the benefits they are capable of deriving from a state of cordiality between England and France. This is the whole and very simple story of a Treaty of Commerce. One set of Englishmen gives a bonus to another set of Englishmen, in order that all may live on good terms with a powerful neighbour. The main objection to Lord SALISBURY's proposal of increasing duties on French imports is not that it is a greater departure from Free-trade than a Treaty of Commerce is, but that it might embitter the relations of the two countries more than the Treaty of Commerce which it is supposed to lead to could sweeten them, and whether it is likely at a given moment to have this effect is a political, not a financial, question. As there now seems a fair chance of a treaty with France being made, the discussion of what it would be wise to do if no treaty could be concluded becomes of a purely speculative character. In spite of all the Bills, with all their clauses, that have been drawn regarding English-Scotch law, it may be doubted whether this is not really also the character of projects of English Land Reform. Special reforms may easily be accepted and proposed; but they are only of a very secondary kind, and could have no great practical effect. Conservative, as well as Liberal, speakers have shown themselves quite ready to give the owners of life estates greater facilities for improving their property, to assure the tenant fair compensation for any unexhausted improvements, and to limit the duration of the time in which the landlord can exercise his right of distress. But when we come to sweeping changes, we find, as the Duke of SOMERSET pointed out, that the friends of the tenant, when they keep clear of mere robbery, ask either for something the tenants do not want, or for something they can get any day they please to take it. They do not want to become rooted in the soil by having long leases; or, if they choose to ask for long leases, with covenants amply protecting them, landlords would be only too glad to comply with their wishes. There may be changes in the law which evidence that could be rigorously tested would show to be likely to improve the general condition of English agriculture. But no one proposes such a change and at the same time brings forward the evidence by which it is supported, and until this is done Land Reform remains outside the region of practical politics. It lies where Mr. CHAMBERLAIN puts it—in the dismal region of a possible cry to catch a non-existent voter.

#### THE PANAMA CANAL.

No rule of international law requires that Governments should make their diplomatic despatches pleasant to those whom they may address. A collection of the communications made by the United States to the English Government would be an encyclopedia, of reproaches, and of veiled or overt threats. The general tone of American correspondence is partially explained by the double purpose which it is almost always designed to serve; the Secretary of State for the time being is not unwilling to annoy a foreign Government, but he is still more anxious to display to his countrymen his own patriotic zeal. Twenty years ago Mr. SEWARD, in surrendering, after long hesitation, the Confederate Envoys who had been lawlessly seized on board an English packet, thought proper to end a long exposition of his reasons for performing a simple act of justice with a gratuitous declaration that the American Government would have detained the prisoners if it had attached any value to the possession of their persons. Lord PALMERSTON and his colleagues wisely accepted the concession, without entering into any controversy as to Mr. SEWARD's hypothetical action in a contingency which had not occurred. The publication of Mr. BLAINE's despatch on the subject of the Panama Canal coincides with the formation of Mr. ARTHUR's new Cabinet. If, as is probable, Mr. BLAINE is about to retire, he apparently thinks it expedient to place on record his unqualified and vigorous assertion of American claims. A successor may be trusted to express sentiments equally patriotic; but he might perhaps forget to attribute a portion of the credit to Mr. BLAINE. The despatch is addressed to all European Powers; but it principally concerns England, and, to a certain extent, France. Other European Governments would be willing to acquiesce in any arrangement which might satisfy the chief commercial and maritime Powers.

The American Government now gives formal notice to the rest of the world that it will maintain the absolute political control of the proposed Canal. The same intention has been intimated on several previous occasions; but it is now for the first time communicated to the European Governments. The only partner in the protectorate or monopoly is the Columbian Government, which possesses the territory through which the passage is to be effected. The giant has no hesitation in allowing the dwarf a share of the privileges which he denies to his equals. With a kind of lofty generosity the SECRETARY of STATE proposes to concede to all nations the commercial use of the Canal; nor is he in any way troubled by the fact that the stock of the undertaking is principally held by French and foreign capitalists. The Panama Railway was constructed under similar circumstances by American undertakers; and many American railways are principally owned in Europe. There is perhaps a literary defect in Mr. BLAINE's combination of declaration and argument. He contends that the Canal will be principally used by American shipping passing between the Atlantic and the Pacific harbours of the Union. There is no doubt that, as he magniloquently says, the possessions of the United States on the Pacific slope are imperial in extent and extraordinary in growth; but it might be answered that the commercial relations of the two coasts require no political ascendancy to be exercised. It would certainly not occur to any other Power to attempt interference with American trade; and in time of peace a protectorate would be useless and inoperative. It is by no means certain that at Panama, as at Suez, English ships will exceed in number those of every other nation; yet the English Government would never dispute the sovereignty of the Columbian Federation. The imaginary scheme against which Mr. BLAINE protests is no other than the proposal of guarantee of freedom of transit on the part of all maritime Powers. It is difficult to understand how such an arrangement could be injurious to commerce. It would for that purpose be wholly unnecessary to consider the amount of shipping which might use the Canal under any separate flag. If the Canal were by common consent regarded as neutral, the competition might safely be entrusted to private enterprise.

The part of the despatch which relates to commerce is in fact superfluous. The real object of the communication is to extend the famous MONROE doctrine. The United States claim for themselves the same political supremacy in the Western hemisphere which is exercised by the six Great Powers in Europe and Asia. "The United States will

"insist on their right to take all needful precautions against the possibility of the Isthmus transit being used offensively against their interests by land or by sea." Mention is elsewhere made of possible war to which the United States or the Columbian Union might be parties. In such a case, the declaration of the American Government would be irrelevant and useless. The belligerents would open or close the Canal as their interest might require and their power might avail, without regard to the powers and rights which are reserved in time of peace. The gist of the despatch is contained in a reference to a treaty, concluded in 1846, between the United States and Columbia, and in a haughty announcement that "this guarantee does not require reinforcement in accession or assent from any other Power." In other words, Europe or England is prohibited from interfering with the American continent; yet it might be thought that Canada, if not England, had something to say to the connexion between the Atlantic and the Pacific. The BULWER-CLAYTON Treaty between England and the United States expressly recognized the right of joint guarantee, which is now formally denied. Nothing has since happened to affect the question, except that the population and wealth of the Union have enormously increased. It is true that England is, to a larger extent than at any former time, at the head of all nations in commercial marine. On the other hand, the American Government has conducted a great war to a successful issue; and it succeeded in placing a veto on the continuance of the French enterprise in Mexico. Mr. BLAINE may plausibly contend that his Government has as much right to the sovereignty of the Panama transit as to the decision whether there should be a Mexican Empire or Republic.

The Americans will in all probability be able to control the Canal, whether their right to exclusive interference is recognized or denied. In international as in private transactions it is perhaps courteous to disguise rather than to assert the possession of special advantages; but it would scarcely have suited Mr. BLAINE's purpose to leave the claims of his own country and of foreign Powers to settle themselves as occasion might serve. A pugnacious disputant has so far the advantage that he has released himself from the restraints of timidity or delicacy. It is assuredly not the wish of England or of any European Power to engage in a controversy with the United States which might easily become a quarrel. Mr. BLAINE is perfectly ready for the contest, and, if his challenge is not accepted, his successors will assume that his pretensions have been admitted. The truth is that the practical solution will be independent of present diplomacy. If in any future war a belligerent should be able and willing to impede the transit of ships, he will not be restrained by a declaration which has no ground in international law, except so far as that anomalous branch of jurisprudence really rests on a comparison of forces and opportunities. The despatch leaves in uncertainty the important question of equal or differential rates on trading vessels of different countries; but, at least in the first instance, the proprietors, like those of the Suez Canal, will probably charge equal rates. There is an ulterior danger that the Government of the United States might obtain more favourable rates for its shipping by negotiation or by purchase. Political control over the Canal and adjacent territory might afterwards be employed to confirm the possession of commercial advantages. As it is certain that the Government of the United States will not hereafter waive the claims which are now advanced, it remains for the European Powers to consider how Mr. BLAINE's imperious document ought to be received. The English Government will perhaps deem it expedient, in acknowledging the communication, to declare that no pretension of the kind can be strengthened by the use of menacing language. It may be well to reserve a right, which may perhaps never be exercised, of protesting against encroachment on the neutrality of the Canal. If a collision at any time occurs, the result will not depend on the arguments which might now be plausibly used. Precedent, down to the time of the French expedition to Mexico, and sound reason are opposed to the American claim; but it is highly probable that the territory on the banks of the Canal will become virtually subject to American sovereignty, and it would be difficult to displace occupants in possession. It is to be regretted that Mr. BLAINE's political position should have required the publication of the despatch.

## CONDITION OF IRELAND.

IRELAND still continues to occupy the foremost place on the political scene, and the advantages of the action of the Government, tardy as it has been, continue to be demonstrated. The higher Roman Catholic clergy, according to their habit, have apparently discerned the winning side, and have cast in their lot with it, though the vigorous action of Archbishop McCABE in reference to a priestly Land Leaguer in his own diocese may not be followed universally. It is too early yet to decide whether the cheerful declarations of some supporters of the Ministry, to the effect that the neck of the Land League—that League which so lately had their open or half-concealed sympathy—is broken, but it is certain that symptoms of paralysis are visible. The cases which the League was to present have, contrary to some expectations, made their appearance before the Commissioners; but that is a function to the exercise of which there can be no particular objection. Outrages, indeed, continue; and in one case—unfortunately, a fatal one—it would seem as if Mr. GLADSTONE's advice at Leeds to anti-Land Leaguers had been taken with that literalness which Irishmen usually show in interpreting the PRIME MINISTER's illustrations and arguments. But there has been no repetition of the Dublin and Limerick riots, and the Liberals, as distinguished from the Land Leaguers, of the Dublin Town Council have mustered up courage sufficient to enable them, with the assistance of their Conservative colleagues and the casting vote of the LORD MAYOR, to defeat the impudent proposal for conferring the freedom of the City on Mr. PARNELL. Nor can it be doubted that the remarkable and very unexpected success of the Government candidate at Berwick is to be taken almost wholly as a verdict of approval in reference to the change of their policy towards Ireland. In the intoxication of this triumph some Radical organs have ventured to hint that they could do without such Conservative support as that which Mr. STANHOPE and Mr. PLUNKET have offered, and which even the HOME SECRETARY acknowledges with gratitude. The leaders of the party, with the possible exception of Mr. GLADSTONE himself, are likely to put a wiser construction on Mr. JERNINGHAM's majority.

It is unfortunate, but inevitable, that in a system of polity such as prevails in England at present public attention should be continually distracted from the actual necessities of the moment by controversies as to the past. It was quite natural that speakers and writers who had been for months and almost for years deprecating the adoption of a certain line of policy should be volubly eager to prove that they had never deprecated it at all. It is equally natural that Opposition critics should indulge in sarcastic reminders; but neither proceeding can be regarded as particularly profitable. The HOME SECRETARY and the PRESIDENT of the BOARD of TRADE in their respective addresses at Birmingham and Liverpool seem to have arranged to divide the field, Mr. CHAMBERLAIN apologizing for the present, Sir WILLIAM HARCOURT courageously attempting to obliterate the past. The HOME SECRETARY has always been remarkable for moral courage, and he has never perhaps shown the quality more conspicuously than in his taunts to his adversaries because they did not themselves nip the Land League in the bud. Sir WILLIAM HARCOURT seems to possess the failing with which Mr. CHAMBERLAIN taunted Lord SALISBURY—a short memory. He would otherwise doubtless have remembered that when Lord BEACONSFIELD's famous manifesto appeared, its prophecy of coming dangers in Ireland was met by the opposite party with a unanimous shout of ridicule, as an attempt to conjure up ghosts in daylight, and an electioneering device. It was after the present Ministry succeeded to power that the Land League, which was previously not in bud, but only in seed, came to be in a state to be nipped; and all the world knows with what energy Sir WILLIAM HARCOURT and his colleagues have until the last few days used the nippers. But these controversies as to by-gones are, as has been said, not over profitable. It is in one sense too early, and in another too late, for them. There is more interest in the spectacle of the Liverpool Liberals, who not so long ago rapturously cheered Lord RAMSAY and Home Rule, rapturously cheering Mr. CHAMBERLAIN and Imperial integrity, and still more in the spectacle of the PRESIDENT of the BOARD of TRADE himself engaged in drawing up a kind of Harmony of the Gladstonian gospels. It is the wont of harmonizers to begin by laying down general principles, and Mr.

CHAMBERLAIN has laid down one which has had at least the merit of providing a subject of amusement for some days to all Tories and most Liberals—that is to say, to the whole people of England save a small fraction. The generous admission that “there may be times when it is “the highest duty of a Liberal Government to support “and assert the law” is not likely very soon to be forgotten. The sermon of which this was the text would have been more effective if it had not, like Sir WILLIAM HARCOURT’s, been vitiated by the presence of some singular readings of history. To say that conciliation towards Ireland is a policy so recent that it has not had time to produce results, and that force has always failed, is simply to reverse the facts. The three-quarters of a century of peace and quietness which, even when England was in sore straits, followed the capitulation of Limerick, contrasts curiously with the half-century of trouble and veiled or open rebellion which, with its continuous series of conciliations, has followed the emancipation of the Roman Catholics. Against romancing of this kind the plain matter-of-fact statements of the Dukes of ABERCORN and MARLBOROUGH—persons whose acquaintance with Ireland perhaps equals that of Mr. CHAMBERLAIN and Sir WILLIAM HARCOURT—may be set with considerable advantage; while Mr. PLUNKER’s speech (could telephonic communication have been established between Chelsea, Birmingham, and Liverpool) would have acted as a simultaneous refutation of the two Ministers. For historical accuracy and political moderation this speech deserves to rank among the very best that the whole question has produced. Mr. GLADSTONE’s remarks at Knowsley were, putting the position of the speaker aside, of less interest than those of his colleagues; but it is fair to make the allowance that he came after them with nothing new to talk about. It was probably impossible for him to be silent, yet silence would have saved him from two awkward utterances. If Mr. CHAMBERLAIN is to be believed when he says that but for the Land League the Land Act would not have been passed, how is Mr. GLADSTONE to be believed when he says that the Land League had nothing to do with his Bill or its success? If Mr. GLADSTONE is to be believed when he says that the League is or was an organized attempt to override the will of the Irish nation, how is it that he left it to work its will so long?

There is, however, one thing that is satisfactory about the apologies of the Government. Lame or not, they commit them and their supporters, as far as such things can do, to the maintenance of their later, as contradistinguished from their earlier, attitude in reference to the Irish question, and that is the principal matter. Supposing this attitude to be indeed maintained, the interest of the situation unquestionably centres upon the working of the Land Court itself. Hitherto the operations of that Court have been merely preliminary, and, whatever their importance, have not had the public attractiveness which will belong to the actual settlement of the first disputed rent in a genuine test case. It is complained, with perhaps not unnatural, but certainly with unwise, querulousness, that the Court has been somewhat ostentatious in inviting tenants to come and be relieved of their burdens. The complaint might come with weight from supporters of the measure, but scarcely from those who have from the beginning regarded it as intended to benefit the tenant at the expense of his landlord. Judge O’HAGAN and his colleagues could not with any decency or gravity invite landlords to come and be shorn; nor can much fault be found with their reply to Lord LONGFORD’s request for information. For it may be reasonably suspected that Lord LONGFORD would receive a very similar answer, perhaps not distinguished by the courtesy which he admits, if he addressed similar questions to any Court sitting, or to sit, between the Strand and Carey Street. It is idle to pretend that the Land Court is a mere *Conseil de Prud’hommes*, appointed to settle the amicable differences between landlords and tenants. Where the differences are amicable, there was and is no need of a Land Court at all; and where they are not amicable, the very fact of its constitution announces it as created to protect, not the landlord against the tenant, but the tenant against the landlord. The measure and extent of this protection remains of course to be proved. There is, however, one remark of Judge O’HAGAN’s which shows more clearly than ever the enormous responsibility which will rest upon the sub-Commissioners, and the great expense of the proceedings. A solicitor, on the part of a

landlord, applied for the exclusion of certain town parks under the Act; the Commission, however, refused to decide the case on this preliminary objection, on the ground that a sub-Commission only could determine the facts by visiting the spot. It would, indeed, almost seem that the Judge does not intend in any case to admit the question of fact, thus constantly involving a double process. These and other points will doubtless be made clear by actual decisions on the merits before long. But, in the meantime, it is not surprising that Irish landlords, whatever confidence they may have in the impartiality of the tribunal, are reluctant to anticipate its operations by voluntary reductions of rent. Such reductions would not save them from a subsequent appeal to the Court; and of the expense, the duration, and the probable results of such an appeal, they are, in the meantime, unable to form the slightest idea.

#### AUSTRIA AND ITALY.

EVERY possible effort is being made at Vienna to give not only a decorous, but a hearty welcome to the King of ITALY. He himself is accompanied by his QUEEN, and attended by his principal Ministers; and Italy is as anxious as Austria to mark its sense of the importance of the visit. The Crown Prince and Princess of AUSTRIA will be present to take their part in what is felt to be, not only a splendid ceremonial, but a considerable political event; and not only the Court, but the people, appear eager to testify their good will towards the head of a State which was until lately regarded as the undying enemy of Austria. That the King of ITALY should come as the cordial friend of the Emperor of AUSTRIA is regarded with peculiar gratification by the Austrians. They are perfectly ready to forget the past; or, if their memory must wander backwards, they may have a secret satisfaction in calling to mind that, amid all the reverses of recent years, they at least always beat the Italians when single-handed. But no doubt they think much more of the future than of the past, and regard the KING’s visit chiefly as a token that the modern policy of Austria is that which most commends itself to Italy as the basis of an intimate alliance. Italy shows that it considers the friendship of Austria as the friendship which suits it best, and Austria shows that it is much pleased that this should be the well-considered opinion of Italy. Such feelings, however, though genuine, are vague, and there could not be a better mode of expressing them than that to which a Royal visit gives a peculiar opening. The tendency of modern civilization is to confute, in the most unmistakable manner, the theory that one man is as good as another. The personal element in government comes continually into greater, and not into less, prominence. Prince BISMARCK is everything in Germany, M. GAMBETTA is very much in France, and Mr. GLADSTONE is at least much in England. Royalty must always be the embodiment of the personal element of government in some shape or other. Both the QUEEN and the PRINCE of WALES are always doing something which no one else could do, and which innumerable persons are extremely pleased to see them doing. It was in a large measure as a personal tribute to the QUEEN that the American Government ordered that the English flag should be saluted at Yorktown, and the sympathy shown by the QUEEN at the time of the late PRESIDENT’s illness and death has done more than anything else to set the tide of American opinion against the Fenians in the States. Towards the accepted and customary embodiments of the personal element in government kindly feelings can be expressed with a warmth and an absence of restraint which cannot always be displayed towards a whole nation, or a principle, or a cause. Those who display the feeling are not obliged to ask how far they may be committing themselves. It is easy and pleasant to give a very courteous and animated welcome to the King of ITALY when it might be difficult to see what is the exact kind of friendship with Italy that Austria desires, what aims it embraces, and what strains or tests it would endure.

No one can doubt that the primary object of the KING’s visit to Vienna is to give a reply on the part of Italy to the Tunis expedition. Not that there are any signs of immediate hostility between France and Italy. On the contrary, the Italian Treaty of Commerce, which the French Government had postponed with an appearance of lukewarmness greater even than it has manifested towards

the English treaty, seems now on the point of being really concluded. Both Governments, too, have a solid tie of friendship in the enmity with which the Papacy equally regards them. The Tunis expedition itself has had the wholesome effect of increasing the dislike of the French people for war, and Italy has at this moment every reason for desiring peace which a delicate financial situation can suggest. It is the future, and probably a not very near future, that Italy is considering. Travellers who have recently visited the mountain districts which divide France and Italy must have noticed the eagerness and rapidity with which military works of defence are being pushed forward on both sides of the Alps. Italy and France are not contemplating a war, but they are contemplating what might happen if a war ever broke out. They are at least guarding against those surprises the facility of executing which often leads to war. Probably the French and Italian Governments could say with equal truth and equal earnestness that what they are aiming at is not so much to make war difficult as to make war unlikely; just as we fortified Portsmouth some years ago, not so much to secure ourselves in case of a war that we foresaw, as to remove from the EMPEROR the temptation of thinking that he could begin a war by seizing on one of our great naval strongholds. The Royal visit to Vienna is very much like the erection of one of the new forts on the Italian side of the Alps. It is a strengthening of the defensive position of Italy. War with Italy would be one thing, and war with Italy backed by Austria, even if Germany kept aloof, would be another and a very different thing. It would be a war into which no French statesman, not even M. OLLIVIER or M. ST. HILAIRE, could enter with a light heart. The Austrian alliance, like a new fort, only in a much greater degree, makes a French war more difficult, and therefore more improbable.

It is not impossible that ecclesiastical matters may occupy some of the attention of the Imperial host and his Royal guest; for it would be by no means wonderful if the Pope decided to leave Rome; and if he chose Salzburg as the place of his exile, and was received there by Austria, it would be a point of great moment to Italy to know what attitude Austria, with the temporary centre of Catholicism in its midst, would hold towards Italy. But a speculative topic like this can only form a subsidiary part of such communications as the EMPEROR and KING may interchange. In all probability they will not interchange any communications of a very definite or practical character. The significance of the meeting is not in the consequences to which a friendship between Austria and Italy may lead at the present moment, but in the friendship itself and its ulterior consequences. In the first place, it is an alliance between the two minor Mediterranean Powers against one of the chief Mediterranean Powers. In the next place, it is an adhesion of no very formal kind, but still an adhesion sufficiently unmistakable, of Italy to the central Powers of Europe, as against France on the one side and Russia on the other. No one in Turkey or out of it believes that the present state of things in the East is likely to be of long duration. Every European statesman must consider how, when the change comes, it can be so shaped as to further the ends which he is in the interests of his own country, and in the interests of the permanent peace of the world, thinks the best. Before the day of great things comes the day of little things is always coming. There is always some minor point arising, such as the Tunis expedition, the action of France and England in Egypt, or the pressure of Russia on the Porte for the payment of its war indemnity, which keeps on the alert all the Powers interested in the ultimate solution. For all the Great Powers, except Germany, the Eastern question is really a Mediterranean question. France, Italy, and Austria are naturally Mediterranean Powers. Russia longs, above all things, to get an outlet from the Black Sea into the Mediterranean, and England regards it as indispensable to the existence of her Empire that she should keep the highway through the Mediterranean open. Italy, from a variety of causes, of which political gratitude was a powerful one, especially in the minds of the late KING and of those who took a leading part in the politics of 1859 and of the years immediately succeeding, was long of opinion that it would be her best policy as a Mediterranean Power to sail in the wake of France. Her exclusion by France from participation in the control of Egypt

and the Tunis expedition have altered the opinions of Italian statesmen. They see that France will always keep down Italy as a Mediterranean Power as much as possible, and that the traditional notion that the Mediterranean ought to be a French lake has still a strong and abiding hold on those who govern France. A coalition between the two minor Mediterranean Powers seems not unnaturally to Italians, under present circumstances, to be the best way of preventing the realization of the French dream. It must be perfectly obvious to every Italian of sense that Italy has nothing to gain in the way of territory that could be of the slightest use to her by the mere breaking up of the Turkish Empire, while Austria has, or may not unreasonably think she has, very much to gain in such an event. That Austria may possibly be some day aggrandized, while Italy is not, is a contingency that Italian statesmen cannot help taking into account. But when they have taken it into account, they may be wise in thinking that Italy, in alliance with an aggrandized Austria, would have a better chance of holding her own in the Mediterranean than Italy as an ally of France, subject to perpetual humiliations. But it is not only the breaking up of the Turkish Empire, which perhaps may not come for years—for it could not come without a prearranged partition or a great war—that is to be thought of. What is to come while the Turkish Empire still endures is the thought that must chiefly occupy the Italian mind. In this preliminary stage of things everything is a question of influence. What is to be the influence of Italy at the Porte? what in Egypt? what if Tripoli is threatened or Morocco is threatened? The influence of Italy at the Porte, or in Egypt, or with Europe, if Tripoli or Morocco is threatened, is likely to be far greater if she appears on the scene as the ally of Austria, and therefore of Germany, than if she remains in the weakness of isolation or in the character of an ally of France, always obliged to endure whatever her great and very imperious neighbour chooses to impose on her. In return, the influence of Austria will be considerably increased when she can come forward as representing not only her own very confined Mediterranean seaboard, but the long coasts of Italy. How each country is to exercise the influence it gains is a point which it may be left to circumstances to determine. It is the fact of the intended co-operation of Austria and Italy that gives significance to the Royal meeting, and as the meeting itself gives assurance of this intended co-operation, it would be an important political event even if the EMPEROR and the KING talked of nothing but the weather when they were together.

#### THE TRANSVAAL.

THE ratification by the Transvaal Volksraad of the Convention is the result of simple causes. The leaders invited the Volksraad to violate the pledges which they had themselves given, in the belief that the Imperial Government would be afraid to resort to force. Mr. GLADSTONE'S declaration at Leeds, and the movement of the troops under Sir EVELYN WOOD, have convinced them that there was a limit to the concessions which they could extort. The Convention is accordingly ratified by a unanimous vote; but it is accompanied by an unintelligible comment. The Boers profess to rely on an assurance of the English Government that the terms of the Convention shall be revised if it is found not to work well in practice. No such promise has been communicated to the press, or otherwise made known in England. It is possible that there may be some inaccuracy in the report. Before the latest news a long interval had occurred since the date of the last important communication from the Transvaal. The Boer leaders had time to become fully acquainted with the impression which was produced in England by the language of the negotiators in their address to the Volksraad, and by the subsequent Report of the Committee. They were also distinctly informed by the PRIME MINISTER, both in his speech at Leeds and probably in more diplomatic form, that they have no further serious concessions to expect from England. The result has proved the justice of the anticipation that, when they found it impossible to rely on the weakness which they must have attributed to the Government, they would induce the Volksraad to ratify the Convention to which the chosen representatives of the Boers are already pledged. The military operations

proved to be the most efficacious arguments. It would have been a great misfortune if regard for national honour had rendered necessary a fresh appeal to force.

Although the Volksraad has sanctioned the Convention, the Boers are not likely after the evacuation of their country to observe its terms with minute fidelity. The Report of their Committee was remarkably candid in the enumeration of articles to which objection was taken. It might, perhaps, be supposed that the English Government would make concessions as to the debt, especially as it may be found difficult to recover any sum which the Boers may promise to pay. It is more surprising that the Committee should express the objections which they really entertain to those parts of the Convention which excite the strongest popular feeling in England. The Committee urged the Volksraad to insist on the omission of three or four important articles, on the idle pretext that they were unnecessary and affronting. Among the provisions which, according to the Report, ought to be excluded from the Convention, are the guarantee for freedom of religious worship, the prohibition of slavery, and the protection of the European inhabitants who have remained faithful to the Crown. The sincerity of one at least of their protests is proved by the recent seizure of property belonging to one of their own community who had refused to join in the rebellion. The obstinate denial of religious freedom, though it is consistent with the old traditions of Calvinism, sounds in the present day like a strange anachronism. The stipulation against slavery was included in the original Sand River Treaty; and there is a kind of audacious honesty in the professed disinclination to renew obligations which have not been found practically binding.

There can be little doubt that the least acceptable part of the Convention is that which provides for the protection of the native population. It is true that the right of interference which was reserved to the English Resident is incompatible with entire independence; but the Dutch negotiators, in recognizing the suzerainty of the Queen, conceded in general terms a limitation of the absolute sovereignty of the Republican Government. It is not known that the representatives of the Boers made any strong objection to the control which the Imperial Government proposed to exercise over the foreign relations of the Transvaal. For English interests the provision is perhaps the most important part of the Convention, especially since the restriction could, unlike some of the internal arrangements, be practically enforced. The pretence that the Transvaal Republic requires facilities for negotiating as to freedom of commerce and transit with the neighbouring Portuguese settlements may be summarily dismissed. The English Government would certainly concur in any reasonable agreement for such purposes, and it would have a right to guard itself against any scheme of differential duties in favour of other nations. Circumstances might arise in which it would be just and necessary to guard against intervention, in the form of treaties with the Transvaal, which European Powers might wish to exercise in South African affairs. A community of forty thousand men, women, and children can scarcely require diplomatic communication with distant States. At the time when hostilities were interrupted, it was distinctly understood that the independence of the Boer Republic was to be limited to internal administration.

It may possibly be desirable to reconsider the terms of the English protectorate over the natives. During the short period of annexation, the native tribes, having technically become English subjects, may perhaps have established a certain claim on the Imperial Government. In practice the relations between the Dutch farmers and the natives had not been materially altered. The coloured population being remitted to its former condition, loses rather a prospect of improvement than any advantage actually enjoyed. No Government could have established equality of rights between the dominant minority and the inferior race. It is impossible to confer full constitutional privileges on half-civilized tribes which largely outnumber the residents of European descent. In the Cape Colony a liberal and judicious experiment has been tried by the institution of a high franchise, which enables a few natives of the highest capacity to exercise political rights. If too many of the natives complied with the conditions under which equality is attained, it would be necessary to readjust the suffrage, so as to secure to the white inhabitants

the control of public affairs. The Boers of the Transvaal will not be at present disposed to admit the natives within their borders to a share, however small, in the government of the country. Lord SALISBURY in his speech at Newcastle reminded his audience that the Boers were not the entire population of the Transvaal, nor even a majority. For his immediate purpose the argument was sound; but, when a civilized community is surrounded by barbarians, political rights cannot be apportioned by the process of counting heads. At this time some of the colonists of Natal are beginning to agitate for the concession of practical independence in the form of responsible government. Their aspirations are injudicious and premature, for their own population is insignificant, and the natives within their borders outnumber them by ten to one. It is for the interest of all parties to retain the control and protection of an impartial Government.

If the English Resident is entrusted, in reality as well as in form, with the protection of the natives, there is reason to fear that his interference may prove to be both irritating and ineffectual. He will have no armed force at his disposal, nor will he command the services of a single policeman. The duty and right of remonstrance will be at the same time ineffectual and undignified; yet, if he neglects to interpose in cases of oppression, his inaction will involve his office and the English Government in discredit. It is not desirable that factions Boers should think their honour concerned in exhibiting the impunity with which they will be able to violate the terms of the Convention. If no real protection is afforded, the natives will suffer by the nominal maintenance of an illusory safeguard. It must also be remembered that a right of protecting natives involves, to some extent, the responsibility of restraining their encroachments. The people of the Transvaal would have a right to complain of any violence or plunder which might be perpetrated by native chiefs who were under the protection or patronage of the English Government. If the stipulations of the Convention are in this respect relaxed, it would be neither necessary nor becoming to rescind the prohibition of kidnapping and slavery. If the engagement was broken by the Boers, the Imperial Government would, as in all similar cases, be entitled to choose its own time and methods for enforcing the performance of the treaty. Since the Convention has been ratified as a whole, it is not impossible that some arrangement with respect to the natives may be made by friendly negotiation. The English Government is bound to secure the rights and property of those who adhered to their allegiance during the recent troubles, and especially of the English residents. The Boers have nothing to gain by persecuting their political opponents, and their possible desire of revenge deserves no favourable consideration. In their contention as to the debt they are probably in the wrong; but in such cases the debtor who is unwilling to pay has a great advantage over a rightful claimant.

#### THE QUARTERLY REVIEW ON THE CONSERVATIVE PARTY.

SEVERAL years ago Mr. DISRAELI compared the two ancient party Reviews to hangers-on at rival coaching inns which had been left desolate by the transfer of traffic from roads to railways. The comparison has become even more accurate with the further lapse of time. Whether one of them painfully argues that Mr. GLADSTONE's Administration is actuated by sound Whig principles, or its rival denounces the Whig oligarchy which has long since become powerless, their relation to the political contests of the present day is as remote as the traditions of the "High-flyer" or the "Rocket." It would be well for the Conservatives if the Government adhered to old Whig principles; and they would profit still more largely by the re-establishment of the Whig oligarchy as it flourished down to the death of Lord PALMERSTON. An article on the Past and Future of the Conservative Party in the current number of the *Quarterly Review* is partly occupied with a vindication of PITT, by whose example, rather than by that of PEEL, modern leaders of the party are exhorted to regulate their conduct. The PITT and FOX controversy is introduced by a short discussion of Whig and Tory politics from the Revolution of 1688 to the end of the eighteenth century. A disquisition on the principles of the twenty-fifth Egyptian dynasty would for practical purposes be

equally instructive. The writer, who might be thought a zealous partisan, suddenly arrives at the conclusion that party government ought no longer to be maintained. As it is impossible to get rid of the system, and especially of the large Liberal majority which is its present result, it is hardly worth while to inquire whether division into parties is expedient or necessary. If there were no parties, there would be no need to discuss the Past and Future of the Conservative Party. It also seems slightly inconsistent for a writer who disapproves of party politics to direct against the Government a not undeserved attack. At the present moment it is true that party struggles ought to be, and indeed are, suspended in presence of a common danger. If Lord BEACONSFIELD or Lord SALISBURY had been called upon as Minister to suppress rebellion in Ireland, there is little doubt that some members of the present Government would be at the head of an agitation in favour of the Land League. Mr. CHAMBERLAIN, indeed, even while in office, avows his partial sympathy with an organization directed against proprietary rights. The conduct of the Conservatives has thus far been admirably loyal and patriotic.

The *Quarterly* Reviewer with reason declares that, if the Opposition hopes to resume power, it must, instead of contenting itself with exposure of the errors of the Government, form and support a policy of its own. The doctrines which the Conservatives are advised to profess and defend would, if the counsels of the *Quarterly* are followed, effectually perpetuate Liberal supremacy. To the approaching extension of the suffrage the Reviewer offers no objection. He is willing to concede household suffrage in counties, though he fears the results of redistribution of seats. It will perhaps be found impossible to resist one of the most mischievous changes which have yet been proposed by the subversive party; but a vast increase of the power of the poorest class is not to be regarded with complacency. The same majority which is about to enfranchise the agricultural labourers will regulate at its pleasure the reapportionment of seats; or, if redistribution is postponed, it will be more thoroughly effected in a future Parliament with the aid of the augmented constituencies. It is but an idle pretence to affect popular sympathies merely because submission to superior force may be unavoidable. The House of Lords, in dealing with the Land Bill, set an example of the tone and spirit in which statesmen may acquiesce in objectionable legislation which they cannot prevent. The principal speakers exposed with unanswerable force the errors of a measure which they nevertheless could not reject without causing greater evils. The Conservative party will not be strong enough to prevent a further degradation of the suffrage, but it is not bound to applaud a vicious policy. The Reviewer also favours the institution of County Boards which will be constructed in such a manner as to abolish the influence of the gentry.

The historical disquisitions of the *Quarterly* Reviewer, and his unwilling approval of household suffrage, have but a slight connexion with the main purpose of his essay. In his opinion the Conservatives are to rehabilitate themselves by a recurrence to the commercial policy which he attributes to CANNING and HUSKISSON, or, in other words, to a comparatively moderate system of Protection. Though his meaning is enveloped in some obscurity, he evidently thinks it desirable to impose duties on corn, and on foreign manufactures, if not on raw materials. By this short and simple method he hopes to win over, not only farmers and landlords, but artisans and traders. It is nothing to a professor of antediluvian politics and economy that the landowners know the restoration of the Corn-laws to be impossible, while most of them would deem it unjust. Neither manufacturers nor workmen fear the competition of foreign goods, though it is true that many among them resent the protectionist tariffs of foreign countries. The imaginary corn duty would, according to its proposer, not even benefit the English producer. Part of the Reviewer's scheme is the fantastic plan of uniting the colonies with the mother-country in a Customs Union, with the result of allowing Canadian corn to be imported free of duty, while American produce would be taxed. Manitoba is, as he truly says, not less well suited to the growth of wheat than the best parts of the Western States; and it would seem to follow that the English farmer would still be undersold, though he might, if he thought it worth while, console himself by the reflection that the profit went into the pocket of a colonist. As a supplement to his notable

project the Reviewer contends that colonial members ought to be admitted into the English Parliament. Perhaps Victoria would return Mr. BERRY, who is bent on excluding from the colony which he lately ruled, not only English goods, but English immigrants. The writer has not the smallest ground for believing that any of the great colonies would concur with the mother country in a common tariff. On the other hand, Englishmen are not prepared to be governed by a Parliament recruited from another hemisphere or from the antipodes.

It would be a waste of time to discuss the absurdities which purport, according to the Reviewer, to form the policy of the Conservative party. It would be a grave misfortune if the only nucleus of constitutional opposition were to be dissolved by the pursuit of impracticable chimeras. The writer in the *Quarterly* violates not only the rules of common sense but the simple principles of discipline. The party can do nothing if it mutinies against its leaders, who have already repudiated the newfangled Protectionism which has been revived under another name. Sir STAFFORD NORTHCOTE has on several occasions expressed his continued conviction of the truth of the principles which he has always maintained. Lord SALISBURY at Newcastle declared that raw materials and the food of the people were sacred; and there is no serious agitation for any impost except a duty upon corn. The attempt to snatch a few votes here and there by humouring temporary and local prejudices can only weaken a party whose influence is indispensable to the country. Those who tamper with schemes of "Fair Trade" risk the defeat or postponement of the coalition which may be anticipated at an earlier or later period between the two great sections of constitutional politicians. No Liberal of any shade will co-operate with advocates of Protection. Even retaliation must be limited to articles which are not produced at home. A duty on Lyons silks would for the time encourage the English manufacturer, with the result of his sudden ruin if the retaliatory policy produced its intended effect in the modification of the French tariff. Lord SALISBURY confined his illustration of retaliatory duties to French wines, which come into competition with no English products. The Conservative party will have enough to do in defending the Crown, the House of Lords, the Church, the institution of property, and the right of free contract, without wasting or annihilating its strength in foolish and impossible enterprises.

#### THE NEXT FRENCH CABINET.

THE month which is almost at an end has been an exciting, yet disheartening, time for the political gossips of Paris. They have found a new rumour awaiting them at every street corner; but they have been unable to retail it except under peril of hearing it contradicted by the fortunate possessor of some newer rumour still. Even the august Bureau which transmits the most authentic intelligence to the English public has had to own itself at fault. The certain truth of one day has been the exposed falsehood of the next. There is reason to think, however, that the two opinions between which M. GAMBETTA was for a time supposed to be halting really represented successive stages in his mental history. He may at one moment have wished M. FERRY to resign without waiting for a debate in the Chamber, and at another have wished him to resign after and in consequence of a debate in the Chamber. Each of these desires is in itself intelligible, because each aims at a different end, and proposes to attain it by different means. In the first instance, it is probable that M. GAMBETTA was genuinely anxious to get the transfer of power from M. FERRY to himself accomplished with as little noise as possible. In this way M. FERRY and the least incapable of his colleagues might have been included in the new Cabinet. It may be objected with much plausibility that a man whose only experience of office has been gained in the character of a dictator could hardly have cared to have for his lieutenant a man who had only just ceased to be *Primo Minister*. The influence which the latter might have been expected to exert in the early days of the new Cabinet's existence would have been inconveniently great. He would have had the threads of all that was going on too much in his own hands. M. GAMBETTA, unless rumour does him injustice, will mean to be master in his own Cabinet; and M. FERRY

is plainly a man who would have had the will, and occasionally perhaps the power, to thwart this intention. But then M. GAMBETTA may have felt that he was bound to think of the political situation, as well as of his personal tastes; and, from this point of view, there was much to be said in favour of a method of Ministerial reconstruction which would have allowed M. FERRY to take office under his successor. Had this method been adopted, the new Cabinet would at starting have been a GAMBETTA-FERRY Cabinet, not a GAMBETTA Cabinet pure and simple. In appearance, at all events, such a Cabinet would not have differed very much from the existing Cabinet. It would have been progressive, because no Republican Minister since M. DUBAUX has been bold enough to proclaim that the Republic would do well to stand still; but it would not have moved further or faster than it fancied itself obliged to move.

For some reason or other, however, M. GAMBETTA thought it wise to reject this unobtrusive way of taking office, and to insist upon hearing from the Deputies what it is that they wish him to do. Now, unless the Deputies are prepared to eat their own words with unusual promptitude and unusual affectation of appetite, the discussion with which the Session will open is almost certain to be of a violent kind. It is said, indeed, that many of the Deputies are less extreme in their views than they allowed the electors to believe. But this suspected moderation is not likely to be shown just yet. Those who secretly favour it will wish to see which way the wind is blowing before they commit themselves to their course. They will allow the speaking to be done by others, and as the issue raised relates only to the acts of a Ministry which is already condemned, they will vote as they are expected rather than as they themselves wish. The result will be, that the apparent strength of the extreme party in the Chamber will be greater after the debate than it was before it, and a Cabinet formed under these circumstances will naturally reflect the tone of the debate which has given birth to it. It will be likely to look for its chief support to that section of the Advanced Left which differs from the Extreme Left in little else than in its desire to see a Radical policy carried out by M. GAMBETTA rather than by M. CLÉMENTEAU. M. GAMBETTA's determination to give the majority in the new Chamber an opportunity of formulating its opinion before he sets to work to construct an Administration is consequently something more than a matter of purely personal moment. It may prove to have some degree of political significance. A large number of the deputies who have been re-elected have not been re-elected to vote quite as they have voted hitherto. They have come back under more stringent pledges to the electors. That they will ultimately try to evade those pledges is likely enough. The men themselves have not changed since 1877; the only difference is that they have had to make larger promises in order to retain their seats. But they will hardly make this attempt in the first debate of the first Session. They will not mount the tribune in October merely to declare that all that they said no longer ago than August was so much moonshine. So far as they speak at all, they will speak in the sense of their addresses to their constituents. They will talk of the necessity of sweeping reforms—reforms which shall for ever purge the Republic of the last taint of monarchical leaven, and make short work of the Church, the magistracy, and the Senate. M. GAMBETTA may know perfectly well that these seeming enthusiasts only mean a fraction of what they say. But he may not be able, when framing his programme or forming his Cabinet, to disregard what has been said and to think only of what has been meant. When the desire to learn the views of the majority from their own lips has been professed by the leader of the Left and deferred to by the President of the Republic, it will not be easy to act as though no such wish had been entertained or acted on.

For the moment, indeed, M. GAMBETTA appears to be once more leaning towards moderate counsels. His speech and his silence during his recent visit to Normandy have alike pointed in this direction. He has for the most part kept clear of politics, and, on the one occasion when he did allow himself to touch on them, it was merely to utter the reassuring commonplace that, as the Republic belongs to the nation and not to a party, it is wide enough to embrace every Frenchman. Generalities of this kind have seldom been found to hamper their authors when it has proved convenient to disregard them. A man must show himself a Frenchman before he can

establish the title to be enfolded in these maternal arms, and the possession of sound political opinions may easily be made a part of the Republican conception of nationality. The foes who belong to a man's own household may fairly claim the largest share of his hatred. That M. GAMBETTA has not lost sight of the advantages associated with the pursuit of a conciliatory policy may be fully admitted. But his realization of these advantages has not governed his action in the past, and there is not much ground to suppose that it will exert any more effectual influence upon his action in the future. In form, indeed, it may still be an open question whether he is going to ally himself with the Moderate or the Extreme section of the Republicans. But, in fact, it seems to be no longer of much importance what the party with which he happens to associate himself happens to be called. The faculty of offering an effectual resistance to the continually growing demands of the extreme Radicals is, to all appearance, denied to French Republican politicians. The utmost they can bring themselves to say is that the time has not yet come for doing this or that, and this dilatory plea naturally serves as an invitation to the Radicals to show that the time has come sooner than the Government expected. The only difference that is likely to be visible between a GAMBETTA Cabinet in which the Moderate Left has the predominance and a GAMBETTA Cabinet in which the Advanced Left has the predominance is that in the one case the Extreme party will dictate what the Cabinet is to do, while in the other case an Extreme Cabinet will do what it dictates to itself.

#### THE ENGLISH LAND QUESTION.

THE agitation for the transfer of ownership from landlords to tenants is so significant and characteristic that, at the risk of repetition, it may be expedient to recur to the subject. Sir GEORGE BOWYER has lately quoted Mr. GLADSTONE's former declaration that the principle of the Irish Land Bill is not applicable to England; yet the chief danger of the movement consists in the uncertainty which prevails as to Mr. GLADSTONE's present or future intentions. He has, with full knowledge of the predatory nature of the schemes which are proposed, vaguely promised to introduce a Land Bill. It is not known—perhaps he may not himself know—whether his designs refer to land-tenure or to the relations between agricultural lessors and lessees. There is some inconvenience in the existence of an omnipotent Minister who cannot be trusted to protect any existing institution or any kind of property. For the moment the land-theorists are comparatively silent, although they may be supposed to retain their objections to life estates, and their desire to create occupying freeholders. The Chairman or President of the Farmers' Alliance, who is the principal author of the project of legislative robbery, has for many years taken an active part in the less iniquitous agitation for changes in the tenure of land. He on some occasions resented, perhaps not without reason, the suggestion that he well knew how little entails or settlements for the most part interfered with profitable cultivation. There is no doubt that, although the great settled estates are better and more liberally managed than small properties, life-tenants are in many instances unable or unwilling to provide capital which might be advantageously applied to improvements. The greater or less extent of the evil was a legitimate subject of discussion. The law of devolution will probably be altered in a few years, if not by the present Parliament; and experience will show whether the abolition of restrictions will tend to the benefit of occupiers. Large farmers will be the principal sufferers if great estates are broken up; and it is perhaps for that reason that the agitation against the existing land laws has for the present subsided. If the difficulties of which their advocates have loudly complained had been urgent, Lord CAIRNS's Bill of last Session, which removed many impediments to the transfer of land, would have been gladly accepted. Perhaps some of the more sagacious tenant-farmers may regard with apprehension a possible result of changes in the law in the form of the multiplication of small freeholds. At the late meeting of the Farmers' Alliance, a simple-minded member who was not in the secrets of the governing body expressed some surprise at the omission in the Bill of any provision for the liberation of the land from the restric-

tions to which estates are now often subject. Mr. HOWARD replied that it was thought expedient for the present to confine the efforts of the Alliance to the adjustment of relations between landlord and tenant.

Since the time when the agitation for changes in the laws of land-tenure was prosecuted under the same auspices, nothing has happened which affects the right of free contract, except that the Irish Land Bill has supplied a precedent for arbitrary interference with the rights of landowners. Repeated and strenuous protestations that the circumstances of Ireland were wholly exceptional are now coolly disregarded. The main principle of the Alliance Bill is servilely copied from the legislation of last Session; and the machinery is more flagrantly unfair than that of the Irish Bill. The tenant-farmers of each Poor Law Union are to elect the arbitrators who will determine the share of the property of the landlords which is to be transferred to the tenant. One member of the Alliance, with a certain sense of delicacy, proposed that the constitution of the tribunal should not be settled before the creation of a new system of County Boards; but the authors of the Bill adhered to their original scheme, though the proposed modification would have made little difference. In the County Boards, as in the Boards of Guardians, the landlords who are to be plundered will be in a small minority. It must be assumed that Mr. HOWARD spoke with literal truth when he declared that few or none of the clauses of his Bill were taken from the Irish Land Act, which Mr. GLADSTONE declares that he will never apply to Great Britain. The promoters of the Farmers' Alliance evidently believe that they have taken accurate measure of Mr. GLADSTONE's character. With or without the use of the same phrases they propose, according to the interpretation of their own partisans, to create fixity of tenure and freedom of sale, and to regulate rents by the discretion of a Court of Arbitration instead of by bargain between the parties. With an abundance of precaution, they have also taken care to pack the tribunal. Perhaps they have some excuse for thinking Mr. GLADSTONE capable of expropriating English landlords in spite of his pledges, on the pretext that the text of the Irish Bill has not been literally copied.

The pretence that the main object of the Bill is to secure compensation for tenants' improvements is transparently fallacious. The supposed improvements are to be measured by the price which a purchaser will give for the tenancy at a rent determined by the tenant-farmers who will be assessors. The landlord may, if he chooses, pay the amount, with the consequence of either occupying the land himself for the future or of letting it to a farmer who will instantly acquire a second tenant-right, to be similarly sold. An applicant may safely bid high for an occupation which happens to suit him, with the knowledge that he may at a later period apply to the Court to reduce his rent. The enactment of the Bill would probably reduce at a stroke the saleable value of all the land in the kingdom by thirty, forty, or perhaps fifty per cent. It would also deprive the landowner of all the pleasures and advantages of his position, except as far as regards the land in his own occupation. If through absence, or during a widowhood or minority, the grazing of a demesne were let to a neighbouring farmer, the tenant would at once become the part owner, and the real proprietor would only be able to resume possession by a partial repurchase. The clauses which affect to provide for any kind of compensation to the landlords would be in practice nugatory. Mr. HOWARD, who, not content with despoiling his victims, seems to wish to practise on their credulity, remarks that the landlord will derive an advantage from the interest which the outgoing tenant will have in providing a solvent and capable successor. Another speaker more candidly observed that he thought that the meeting had better confine itself to the benefits to be conferred on the tenants, without troubling itself about the interests of the landlords. It is not an encouraging illustration of the tendency of democratic government that an intelligent and personally respectable body should publicly meet together to ask from Parliament a gratuitous donation to themselves of property belonging to a class which, as they think, commands fewer votes. Few of their number can really think that their demands are just or reasonable.

Owners of other kinds of property will be guilty of culpable imprudence if they countenance or tolerate an open attack on the rights of landowners. The bold and

paradoxical demand of the abolition of all freedom of contract between landlord and tenant will assuredly not be confined to one kind of wealth. Land has been acquired by its owner as honestly and as lawfully as any other kind of investment. The State has guaranteed his possession as fully as if he or his predecessors had bought Consols, or shares in mines, in railways, or in other industrial undertakings. One of the implied conditions has been that he should, subject to the law as it existed when he invested his money, be at liberty to make the most advantageous bargain with any persons who acquire under him any estate by hire or by purchase. The right of the Legislature to expropriate him for public objects has in most cases not been a matter of practical consideration; and, in any event, it was to involve full compensation. It is now proposed that any contract of letting which he may make shall be invalidated if the tenant, finding it disadvantageous, can satisfy a partial Court of the justice of his contention. The whole land of Great Britain is to be summarily excluded from the domain of free contract, founded on demand and supply. On the other hand, the tenant, if he deems his case too outrageous to be brought into the Land Court, can at any time practically throw up his occupation. The recent experience of landowners shows that the abandonment of farms is a common occurrence. If the Irish Land Act, in itself anomalous, is to form a precedent for an English Land Act, the Bill of the Farmers' Alliance will more fully justify future schemes for the confiscation of capital. On the Continent projects of legislative spoliation are more usually directed against personality than against property in land. The farmers themselves will do well to take warning by the threats of the Labourers' Union. Agrarian revolution will not end with the creation, without a shadow of right, of perpetuities in favour of those who at present happen to occupy large farms. With cynical selfishness, the agitators not only covet the property of landlords, but utterly disregard the interests of future applicants for farms and of small purchasers. The Alliance Bill, if it became law, would in a great degree prevent the acquisition of freeholds of moderate size, because no man could prudently buy a farm which he could not safely let. The labourers will, in virtue of the votes which they will soon acquire, be able to use the only argument on which the Alliance agitators now rely. If property is to be distributed by popular suffrage, it will not belong to large farmers.

#### THE WILBERFORCE CASE.

THAT the trial of MABEL WILBERFORCE could come to only one end was from the beginning as much a matter of certainty as anything can be which depends upon that very variable quantity, the intelligence of a jury. It would have been a grave misfortune if a flagrant example of one of the most mischievous of crimes had missed its due punishment; yet the trial cannot be said to have been altogether satisfactory in its result. No one, except very stern moralists, will complain of the comparative leniency of the sentence. MABEL WILBERFORCE, or AMY NORMANDY, or MRS. TRENEFID, or the Countess DE PENEFLIS, was a sufficiently audacious adventuress, and the evidence shows very clearly that, at least in her earlier life, she had not been too careful to keep untarnished that "crown of her womanhood" of which she spoke so pathetically in court. But of positive crime as distinguished from vice there is, putting her perjuries out of the question, not a very heavy record against her; indeed the record may be said to be confined to a failure to discharge the bills of carvers and gilders with due punctuality. She was certainly not the sort of person that an affectionate son would desire as a companion for a father in something like a condition of dotage; but that is about all that can be said. The extraordinary recklessness of her fictions, in which she utterly disregarded a certain wise criticism and "kept 'not time,'" has been much commented upon. But this is a not uncommon failing of her sex, and it may be accounted for partly by an old habit of making assertions which nobody took the trouble to examine or expose, and partly by the irritation which the Charity Organization Society has the special faculty of arousing in the guilty and the innocent alike. That association has many enemies; but a defender of it who should not blush at paradox might urge that this faculty is not without its

value from a public point of view. It cannot do much harm, though it causes much annoyance to the innocent, and induces the guilty to put themselves definitively within the grasp of the law. So Miss WILBERFORCE, in a familiar phrase, "put her head down," and went blindly into the fray, with the natural results. The prosecution could certainly afford to abandon point after point which she professed herself accidentally unable to meet. Enough remained to support half-a-dozen distinct charges of perjury; and it is only surprising that so artless a person should have succeeded in living on her wits until the tolerably ripe age of forty or forty-two, which, it would seem, must be substituted for twenty-seven in Miss WILBERFORCE's description. It is true that the history, as opposed to the fiction, of her life was not got up by the prosecution with the artistic completeness of a French *dossier*. Her own story was complete; but, unluckily, the parts would not hold together. Mr. POLAND's story was quite invulnerable as far as it went, but it leaves large portions of Miss WILBERFORCE's life unaccounted for. It is, indeed, possible that edification, as contrasted with amusement, has not lost much by the existence of the gaps.

In this, however, as in some other points connected with the trial, there is matter of more public importance than the mere detection and punishment of an interesting adventuress. It is perfectly clear, from what has actually been proved, that Miss WILBERFORCE was a person upon whom it would have been just as well that the police should have their eyes, and it does not appear that, until she drew down upon herself the suspicions of the Charity Organization Society, anybody had any kind of watchful eye upon her. This is, indeed, a minor point, because it is on the whole better, according to the English conception of personal and political freedom, that wolves should sometimes be able to masquerade in sheep's clothing, than that sheep should have their fleeces rudely pulled about and officially inspected. The actual conduct of the trial itself suggests other matters of more importance. There can be no doubt that, however badly MABEL WILBERFORCE played her game as a concocter of personal and family history, she did not play it at all badly as an advocate for her client. She succeeded in wasting a great deal of time; in actually parrying, not by acute cross-examination, but by well-acted helplessness, some of the charges brought against her; in attracting a considerable amount of sympathy out of doors, and in producing a most extraordinary effect on the jury. All this would have been prevented, while the ends of justice could not have been in any way defeated, by the appointment of a responsible counsel for her. It may seem at first sight brutal to deprive a woman of her recognized feminine arms; but a very little consideration will show that such conduct of a case as that which MABEL WILBERFORCE was allowed is an absurdity. She was alternately counsel and client—the former when she thought she could meet a charge, the latter when she knew she could not. No one was exactly to blame for this. In instances where a defendant is both able and willing to conduct his own case under the ordinary restrictions imposed on counsel, it is of course desirable that he should be allowed to do so. But in cases where those conditions are not fulfilled, it seems desirable that professional assistance should be as a matter of course assigned. This is already done in certain cases in England; in Scotland it is, if we mistake not, the rule; and there are advantages in it which are obvious enough, and which have been strikingly illustrated in this case.

The conduct of the jury, however, and the eccentric manner in which the actual verdict was arrived at, are, after all, the matters which most deserve comment. It must have been impossible for any reader of the report to repress a feeling of devout thankfulness that his own life, freedom, or property was not subject to the arbitration of the singular beings who hesitated, and for a long time refused, to find MABEL WILBERFORCE guilty of perjury. Nothing need be said of the recommendation to mercy; that was sensible enough, and would probably have been endorsed by a very considerable number of persons both in court and out of it. But how any reasonable man with the evidence before him could doubt that perjury had been actually committed is a mystery which is comprehensible only to those, and even to those but partially, who have had the misfortune to be on juries themselves, and have thus had an opportunity of analysing the reasoning processes of the average jurymen. The

*pulcheris exigui jactus* by which this unexpected disturbance was quelled was as characteristic as the trouble itself. The belief of the jurymen in Miss WILBERFORCE's innocence was proof against logic, but not against lunch—or rather the loss of it. Had Mr. Justice HAWKINS been more compassionate or less patient, an absurd miscarriage of justice, which would have been a great encouragement to the honourable fraternity of perjurers, must have occurred. As it was, the jurymen, driven to choose between Miss WILBERFORCE and their midday meal, decided for the latter—an additional proof of the wisdom of PERCIUS and RABELAIS in indicating the true Master of Arts, Logic, among the rest. It is not wonderful that the circumstance should have been made an occasion of renewing the cry for the substitution of decision by a majority for unanimous decision in such cases. Unluckily it is by no means invariably the case that the majority are on the right side, and so the one system has nearly as much chance of going wrong as the other. However, on this particular occasion no actual harm has been done, except the harm which may arise from such a display of the haphazard manner in which pains and penalties may or may not be incurred. It is to be hoped that when Miss WILBERFORCE, or Mrs. TRENEFIDE, comes out of prison, she will bestow in some better way the talents which, despite her inability to make up a connected story, she undoubtedly possesses. Judging from the conduct of the jury, she will not find it impossible to discover believers in her complete innocence even then. Indeed, the brightness of her at present rather dark prospects and the reputation of the jury for intelligence both gain from a supposition which is, after all, not improbable—that her defenders among the twelve voted as they did, not because they loved her much, but because they disliked the Charity Organization Society more.

#### PONTIFICATE OF LEO XIII.

THE current number of the *Edinburgh Review* contains an interesting article on Pope Leo XIII., chiefly occupied in recounting, from the writer's point of view, the past events of his pontificate. There is not much in the actual record that will be new to our readers, and many of the views expressed are in substantial accord with those which we have frequently put before them; but the reviewer makes some statements which are questionable or exaggerated, or at least require confirmation, and others which are unquestionably incorrect; and while his estimate of the aims and intentions of Leo XIII. is in the main a fair one, the final verdict pronounced on his career as a whole is certainly premature and probably unjust. On the details of the last Conclave it is needless to enlarge here, the more so as the subject was fully discussed in our columns at the time; but there are one or two points in the Reviewer's narrative which require supplement or correction. It was not only the successful discharge of his duties as nuncio at Brussels, but still more the express recommendation of King Leopold I., which made it practically impossible to ignore Pecci's claim to the purple, though the secret distrust of Pius IX. and the unconcealed jealousy of Cardinal Antonelli interposed an unprecedented and scarcely decent delay to his promotion, nor was he summoned to Rome till after the death of the latter. It is true that he was then raised to the high dignity of Camerlengo, but the Reviewer omits to explain that this act of the moribund Pontiff may not improbably have been designed to bar his way to the succession, as it is very unusual indeed for the Cardinal Camerlengo to be elected Pope. There were, by the way, if we are not mistaken, not two but four "creatures" of Gregory XVI. still surviving at the time of the last Conclave. It is a popular error no doubt to imagine that "the great Catholic Powers have or had a veto on a consummated election." No such right was ever claimed or admitted. But it is hardly accurate, on the other hand, to speak of the veto which is claimed by Austria, France, and Spain, and has frequently been exercised, as simply "a matter of courtesy," though it rests on no express written guarantee. No candidate whose name had been previously denounced by the Cardinal representing any of the three privileged States has for many centuries been elected, but this veto must precede the election, and can be exercised once only. There is one incident again connected with the election of Leo XIII. on which the Reviewer dwells at some length with more severity, to say the least, than our existing information justifies. It may reasonably be regretted that the new Pope yielded to the persuasions of those around him and gave his primary benediction *urbi et orbi* from the inner instead of the outer balcony of St. Peter's; but it was reported at the time on high authority that his hesitation was due to the refusal of the Italian Government, which had been privately communicated with, to ensure order at the traditional programme was observed; nor can it fairly be said that their subsequent conduct makes this explanation a less plausible one. That another and far graver procedure of the newly elected Pontiff was more well-intentioned and con-

scientific than discreet we have always ourselves maintained. To restore—or rather to give—at once to the College of Cardinals the full enjoyment of their constitutional rights as the standing Council of the supreme ruler of the Church was in itself a most praiseworthy act; but for Leo XIII. thus to seize the first moment for making into a reality what for centuries had been little more than a traditional fiction, while the Cardinals were, almost to a man, the chosen nominees of Pius IX., was to tie his own hands by anticipation with fetters the pressure of which he has never ceased to feel. We can readily believe, though we should have liked to hear the Reviewer's authority for so positive an assertion, that "he soon began and has never ceased bitterly to repent it." It is true that fifteen Cardinals have died since then whose places have been filled up by Leo himself, but this does not materially alter the situation, especially when we bear in mind how many collateral considerations of precedent, claims of foreign Powers, personal distinction and the like, quite apart from his own immediate wishes and aims, a Pope—and notably a constitutional Pope—is bound to recognize in his nominations to the Sacred College.

There are two points, distinct but closely connected with each other, as both arising out of his relations to the Italian Government, which from the time of his accession have been among the chief difficulties of Leo XIII. The one may be summed up in the well-known formula of the last reign—*Nè eletti nè elettori*—while the other concerns the Law of Guarantees and the income of three and a half million francs provided by it for the Holy See, which, however, has never been accepted. On the former point the Reviewer has not much to say that is new, but our readers may recollect that we called attention not long ago to a remarkable Italian pamphlet advocating a change of policy in this respect, which was believed to emanate from Papal inspiration, and a paper of Mr. Adolphus Trollope's, who professed to speak from personal knowledge, and proceeded to discuss the probable effects of such a change on the composition and policy of the Parliament. The opinions entertained on the matter for some years past by Father Curci are sufficiently notorious; but his position is in many ways so unique that the following account of his first appearance as a reformer may be worth extracting:—

One man there was, however, in no wise included in those [ruling] classes, who, having very strong convictions upon the subjects in question, cast prudence to the winds, and raised his voice in vehement protest; and the voice was one which could not fail forcibly to arrest the attention of those to whom it was addressed. Father Curci was a member of the Company of Jesus. The Jesuits were, speaking generally, the most violent and thoroughgoing of all the supporters of Pius IX. in his claims, his purposes, and his policy. Yet it was from the ranks of the venerable company that issued this solitary voice, arrainging the wisdom of the line of conduct marked out for the Church by its rulers. Father Curci was an eminent member of the Order, and one of whom it had good reason to be proud. He was known as a man deeply versed in theological learning, especially great in exegesis, and as a preacher of rare eloquence. He had given at Florence a series of exegetical lectures on the books of the New Testament, and received much praise for them. But on publishing these lectures in four large volumes, he inserted a preface (published also separately as a pamphlet), the effect of which within the ecclesiastical pale was as the sudden and clanging blast of a trumpet breaking a drowsy silence. This was towards the end of 1874.

This very remarkable pamphlet, consisting of fifty-six closely printed octavo pages, was sold for half a franc, and was therefore evidently intended for extensive circulation. It is in truth more than remarkable: indeed, considering the position of the author, a most extraordinary manifestation of opinion, highly curious in many respects: curious from the striking difference between the mode in which the author's mind evidently works and that to which the reading world is accustomed by modern thinkers; curious from the strictly ecclesiastical style of the writing, looked at merely as literary composition; and above all curious as the study of a very original, powerful, and conscientious mind, subjected to all the influences, all the pressure, all the education of a Jesuit priest. The fifty-six pages of the pamphlet would be well worth a close and detailed examination, not only for the above reasons, but on account of the sensation caused by the publication, and the results which ensued from it.

Of his last publication—*Nuova Italia ed i vecchi Zelanti*—we have before now had occasion to speak, and we shall have to refer presently to the reception it has met with from the Church authorities. The very different personal treatment of the author by the late and the present Pope was already well known; he was not only entertained by Cardinal Pecci, the Pope's brother, at the Vatican, but during his stay there had several private interviews with his Holiness. We were not, indeed, aware that Leo XIII. also purchased many copies of Curci's earlier works "which he gave as presents to a variety of ecclesiastical seminaries"—presumably in order to disseminate the opinions broached there among the rising generation of the priesthood; or that Curci himself had emphatically assured an English resident at Rome at the close of last year (the italics are not ours) that "*the Pope thinks on this subject [the recognition of the Italian Kingdom] as I do.*" But it is certain that the general line of conduct pursued by Leo XIII. since his accession, and his manifest anxiety to use every available means for healing the breach between the civil and ecclesiastical authorities in every part of Europe, entirely confirm this view. The notion vaguely started by one section of Ultramontanes during the later years of Pius IX. of appealing, like Hildebrand, from the Government to the masses, clearly does not find favour with his successor. In Germany, in Belgium, and in Russia, the changed attitude of the Holy See has not been unproductive of results favourable to the Church, and there can be little doubt that the Pope would be only too glad if he could also come to terms, or at least devise some tolerable *modus vivendi*, with Italy, where however the problem is confessedly surrounded on all sides with quite exceptional difficulties.

The fiction of "imprisonment," which it is the misfortune rather than the fault of Leo XIII. that he has found himself unable to break through may be absurd enough, but recent events in Rome have not been encouraging to the aspirations even of a liberal Pontiff, and there can be little doubt that the question of at least a temporary migration from Rome has been, and is, seriously entertained, manifold and various as are the grave objections to such a step which must inevitably occur to those concerned. There is, apart from all disputed questions of principle, more than one practical difficulty about accepting the Law of Guarantees and the income it offers, even if that income were, as it is not, sufficient for the purpose. There is, for one thing, as the Reviewer justly observes, "no security whatever for the permanence of such an income. It may be observed, on the other hand, that neither is there any security, especially under a liberal pontificate, for the permanence or adequate amount of the precarious income at present derived from Peter's Pence. There are strong grounds for believing that under Pius IX. the opportunities for embezzlement, now cut off, acted as a stimulus to the zeal of collectors of the *obolo*, and there can be no doubt at all that the Jesuits have been less active promoters—if not active hinderers—of the collection of supplies for a Pope who declines their guidance. Certain it is that the receipts have regularly varied according to the tone of the public utterances of the present Pope; that there was a conspicuous falling-off in the amount at the beginning of his reign, and that every indication of a resolve to maintain the claim to the temporal power has been at once followed by a marked increase in the amount collected. He is thus placed, as it were, between two fires, and must depend for the necessary supplies on the constancy of a Government he cannot trust, or on the caprice of Ultramontane wire-pullers who heartily distrust him. A Pope placed in so trying a position may well expect to have some allowance made for what might seem an over-cautious or vacillating policy. And the appearance of Curci's last book, little as he might find in the opinions advocated to disapprove, could not fail seriously to increase his perplexities. Among other things Curci sharply condemns the publication of the too famous Syllabus, though he insists that it contains no new doctrine or new ecclesiastical pretension—which is only true in a sense. The Syllabus contains doctrines and pretensions which have never before been summarized and propounded with the same emphasis and solemnity, and in a form maintained by many high authorities—though Cardinal Newman ridicules the idea—to be an "*ex cathedra*" decision. The Reviewer rather understates than overstates the case when he says it was like pointing a pistol at the head of the lay world with an intimation of "This or nothing." And Curci touched a still more burning question in the chapter headed "By whom and why, this [infallibilist dogma] was determined on; the liberty of the Council rendered doubtful by intruders." That the Vatican Council had no real liberty of action has all along been notorious, but we were not aware of the startling confirmation of the fact supplied by a letter of Bishop Strossmayer's which appeared originally only last July in the *Deutsche Merkur* and was reprinted in the *Kölnische Zeitung*. It is too long for extracting here, but the Bishop states his "firm and unshakable conviction, which I shall uphold before the judgment seat of God," that the Vatican Synod lacked the liberty necessary to make it a real Council binding on the consciences of the faithful, and he proceeds to dwell on the detailed evidence of this which will be familiar to readers of Friedrich's *Tagebuch* or the *Letters of Quirinus*. A book containing this and other suspicious matter from the pen of an ex-Jesuit could hardly be published with impunity, and the "*Vecchi Zelanti*" naturally urged the Pope to condemn it. He replied that it was the business of the Congregation of the Index to examine it. And here we must correct a strange blunder of the Reviewer's, who says that the sole business of this Congregation is to decide "whether a book is heretical." On the contrary, nine-tenths of the publications placed on the Index are censured on some minor count, as e.g. "proximate to heresy," "ill-sounding," "offensive to pious ears," inopportune, or the like; and the "laudable submission" of an author to the censure is not at all necessarily understood to imply any retraction of his opinions. The iniquitous condemnation of Rosmini's famous *Cinque Pighi* is a case in point, for after his death all his works were pronounced by the Roman authorities to be entirely free from error. We had certainly imagined that Curci's book was placed on the Index, and that he had "laudably submitted himself." The Reviewer says however that the Congregation, in spite of having their attention specially called to the passages we have referred to, declined to pronounce any decisive judgment, and that the book was therefore handed over to the Congregation of the Inquisition, who condemned it, not as heretical, but as "a libel on the Church and the Holy See," and whose sentence was sanctioned by the Pope. If this is an accurate version of what took place, it is difficult to defend the conduct of Leo XIII., who probably considered imprudence the worst fault chargeable on Father Curci's book; but neither would it be fair to blame too severely his conduct under very difficult circumstances. He may have taken care to exempt the work from the stigma of heresy, which it would certainly have incurred under Pius IX., and may have thought a modified censure, which need not mean very much, the only practicable method of averting worse complications. In any case it is much too soon to pronounce a sweeping condemnation on his "moral cowardice," and invoke against him the familiar sarcasm of the great Roman historian, *dignus imperii, nisi imperasset*. Many things have happened, and much has been

affected by him, in the three years he has already filled the pontifical throne, and, if only his health is preserved awhile longer, much more may still be accomplished before he yields his place to another.

#### THE SALE OF GIBRALTAR.

A CURIOUS side light on the views which are entertained abroad of the foreign policy of the present Government, and at the same time a prospect of much congenial occupation for the Prime Minister, is to be obtained from a paragraph which went the round of the papers at the beginning of this week. Spain, it seems, has so much money that she does not know what to do with it, and the moment seems so favourable for such an operation that a subscription is to be set on foot for the purchase of Gibraltar from England. Some Madrid bankers have offered to start the fund with five million of francs—a handsome basis certainly. In the improbable event of England declining the bargain, the money is to be spent on rival fortresses dotted about the Straits; but this is evidently “done as chapmen do,” to quote *Troilus and Cressida*. The inconveniences of muzzles at Ceuta and Algeiras are only intended to frighten the shopkeeping nation into an acceptance of the bargain. We do not know what the total price likely to be offered may be. Fortresses are not very often quoted in the market, and then there is the *pretium affectionis* to consider. The Heathfield picture, the perpetual copyright and all obtainable exemplars of Drinkwater’s History, the memories of Rooke and Rodney, and so forth, would have to be reckoned in. Just at present, however, all this may be classed under the head of “Vieux habits, vieux galons,” and is not likely to fetch much. The Spaniards have calculated their time well. However, judging from the proposed basis of the Madrid bankers, we should imagine that a nation of Castilian and other gentlemen could not do much less than cover this deposit several times over. A million sterling—if not two—ought to be bid at the very least. Then there is the important consideration of the relief on the garrison expenditure. This, again, is not very easy to calculate. But the normal garrison of Gibraltar is, we believe, five thousand men, and there is a rough and ready computation that every man on active service costs Britannia, all things considered, about a hundred a year. Call it half a million, then, and capitalize it at thirty years’ purchase—which, with Consols about par, is certainly not too much—this will give altogether a *benefice* of sixteen or seventeen millions for Mr. Gladstone to manipulate, with the prospect of at least as much more should Italy follow so excellent an example and buy Malta. For the present, however, we shall confine ourselves to the actual “deal” which is at his disposal, for the prospect of what might be done by a judicious realization of disposable assets of this kind in different parts of the world is altogether too dazzling. Let it be supposed, then, that Mr. Gladstone has a chance of only sixteen or seventeen millions (the loss of prestige and of the command of the Mediterranean may be treated as Mr. Perker treated “breach of honour and loss of the lady” in a famous instance), to be obtained by the simple process of handing over those keys which are believed to repose nightly under Lord Napier of Magdala’s pillow, and which, to judge from recently published statements, are, more prosaically speaking, frequently within the control of a sergeant of infantry.

It is impossible for any one to ignore the numerous attractions which such a plan would have for the present Prime Minister. To speak generally, three things may be said to be dear to Mr. Gladstone—the giving up, or destruction, of something or other belonging to his country; the elaboration of ingenious reasons for the defence of his conduct, no matter what it may be; and the opportunity of playing complicated games of a financial character. Mr. Gladstone doubtless read his Plato at an early age, and there can be no doubt that the sentiments of Cephalus, the father of Polemarchus, inspired him with a proper repulsion. That easy-going Athenian’s ambition was to hand on his patrimony, if possible, slightly increased, but certainly not diminished, to his successors. The more worthy ambition of Mr. Gladstone is to strip this little island, as he is pleased to call it, of a portion of its superfluous possessions, that so Mr. Chamberlain and his other heirs may find it easier to manage. He has already been wonderfully helped in this respect. But the expunging of Gibraltar from the roll of British possessions would be a far nobler distinction than that of mere windfalls and bad bargains like the Ionian Islands and the Transvaal. There is not a stone of Gibraltar which does not represent an English life gallantly lost, or not less gallantly, though bloodlessly, spent, in the service of England. There is not a square of bunting anywhere on the globe that flies encircled with prouder historical associations than that which surmounts the Rock. To get rid of all this must have some savour in it to a temperament like Mr. Gladstone’s. Then, too, there is the opening presented for financial exercises. It is but seldom that such a transaction brings money with it, and some of Mr. Gladstone’s experiments of the kind have been notoriously rather expensive, though highly satisfactory to the national conscience. Here the national conscience and the national pocket would be in an equally happy condition. It requires a steady head even to conjecture the feats which seventeen millions in hand would enable Mr. Gladstone, especially at his recent rate, to perform with English finance. There is, for instance, the abolition of

the Malt-tax which fills certain persons with such endless admiration and delight. We forget exactly how much Mr. Gladstone estimated it would cost him to take the duty off malt, and put it on (rather more heavily) on beer. But it was not much, and indeed the proceeding does seem capable of accomplishment at no heavy expense. With seventeen millions what might not be done? The tea duty might be abolished entirely—to be put on again in stamps on teapots—and so Mr. Bright’s ideal of legislation might at last be fully, or very nearly, achieved. Tobacco could be freed—and of course a corresponding licence duty put on smokers. We really do not see why the Income-tax should not be abolished with the help of these seventeen millions, though of course it would be in the highest degree unreasonable to prevent Mr. Gladstone from making up the loss to the revenue by a tax upon expenditure. The capacities of the Malt-tax operation are nearly infinite even in themselves; but when a man comes to the work with seventeen millions in his pocket for contingent expenses, he must be an uncommonly bad operator if he cannot do wonders.

The attractions of the subject for Mr. Gladstone and the probable interest to his admirers and observers—the two words are not invariably synonymous—have, however, not been yet exhausted. It is particularly pleasing to think of the series of speeches which would announce and justify the acceptance of the patriotic proposal of the Madrid bankers. “The tail is wonderful, but the reason is much more wonderful than the tail,” says an author with whose works Mr. Gladstone is no doubt acquainted, though perhaps only by name. There are, we fear, considerations which make it impossible that Lord Beaconsfield should have had Mr. Gladstone in his mind when he wrote that remarkable sentence, but nothing could be more accurately descriptive. Mr. Gladstone’s tails (in every sense and spelling of the word) are always wonderful, but his reasons are much more so. The modest student may indeed frankly profess that it is impossible to anticipate them exactly and in detail. No one except a reckless caricaturist could have anticipated the Doctrine of the Wicked Grandfather or the Principle of Centrifugal Representation. Few who speak honestly will say that they knew the distinction between the responsibility attaching to polemical and political utterances before Mr. Gladstone told them. The glow and triumph of such a stroke as the surrender of Gibraltar would almost certainly inspire him with some of those unimaginable flights of paradoxical casuistry by which he has assured himself a place in history. But the general lines of the *apologia* may probably be divined. We should certainly hear once more that righteousness exalteth a nation—a text the repetition of which, taken in connexion with that of a few others, seems to argue the existence of a dim idea on the part of Gladstonian controversialists that the final cause of the Scriptures was to supply them with suitable excuses for convenient acts. A glowing picture would certainly be drawn of the impregnable moral barrier which the modern Hercules had erected at the Straits. Mr. Gladstone is your only architect of moral barriers, and the sole objection which can be taken to them is that they don’t keep out immoral antagonists. “Oh, gentlemen,” Mr. Gladstone might say (this particular formula of address is reserved for great occasions when it is desirable to break up the Turkish Empire or unsettle the sons of those who dare to preside at gatherings held in the honour of Mr. Gladstone’s rivals), “Oh, gentlemen, let us continue virtuous, for the state of those who have ceased to be so makes me tremble.” The gratitude of the Spaniards for the sublime acceptance of their millions; the extreme convenience of possessing those millions; the financial wonders that would be produced by their due employment; and the contrast between the wicked Tories who spend and the virtuous Liberals who save, would all figure. Especial stress would be laid on the envy and wonder of the nations at the magnanimous conduct of Great Britain; and, while it was left in obscurity whether the envy was directed towards the millions or the political act, it would be hinted that the real satisfaction was to be found in the combination of a quiet conscience and a full purse. We have owed to a modest reluctance to attempt the finer strokes. Perhaps Mr. Gladstone would demonstrate that the history of Gibraltar since the unapologetic conduct of Tarik was such that no right-minded nation could comfortably retain it in its list of belongings. Perhaps he would insinuate that, as Sir George Rooke was a Tory—and there is no doubt that he was—the original acquisition of the place was tainted so irremediably that the least a decent Liberal Government could do was to get out of it as soon as possible. There is no knowing what eccentricities of history or logic would be uttered, and of course promptly cheered by Brother Hiley and Brother Bragge on the platform and in the press. But it is certain that the moral barrier theory and the quotation about righteousness, or some other to be found without much difficulty to the same effect in Cruden, would figure.

The only drawback to the prospect which must cheer Mr. Gladstone is to be found in the recent utterances of his friend, the President of the Board of Trade. It has often been noticed as a singular phenomenon that English democrats are almost alone in their class in seeking to destroy the greatness of their own country. Now, if Mr. Chamberlain is to be taken as speaking literally, and not polemically, he is a desperate Imperialist, while another Radical member of the Ministry, though not of the Cabinet, has sometimes been irreverently described as a Jingo in sheep’s clothing. It would be an awful thing for Mr. Gladstone’s grey hairs if he should discover that he has nursed a brood of serpents who fail to see the

beauty of renunciation, and are disposed to talk and think and act like Americans and Frenchmen on the subject. He has, indeed, been converted before now, and has always possessed a mind singularly open; but, after all, there are limits to openness. Fortunately for him, there are as yet but few signs that Radicals as a body have been inoculated with the poison which makes an American President speak of the possessions of the United States as "quite imperial." As for the general run of his supporters, their attitude towards the proposal might be an 1874 attitude, or it might be an 1880 one. The reflection is both consolatory and indisputable—not, however, in equal degrees.

#### THE MIDLAND RAILWAY ACCIDENT.

THE first impression probably which the account of the accident on the Midland Railway made on those who read it was, that here, at all events, was a case in which the Railway Company was blameless. At the place at which the express train ran into the mineral train the points are ordinarily worked on a system which makes the occurrence of such a disaster all but impossible. Given that the driver of the express train is looking out for the signal in front of him, and that, if this signal is at danger, he at once turns off steam, there is not the slightest fear of his running into a train standing where the mineral train stood. The passage into the siding is only open to him when the signal warns him that he must come no further. As soon as the signal allows him to advance, the points are mechanically closed and he cannot leave the main line. In this instance the machinery by which this mutual action of points and signals is usually secured was out of gear. Instead of the signal necessarily standing at danger so long as the points leading into the siding remained open, it would only stand at danger if the signalman had remembered to place it there before or after he had opened the points. The mechanical security was suspended, and in its stead there was only the security of a particular servant's memory and self-possession. Unfortunate, however, as the results of this substitution proved, the substitution itself was not the fault of the Railway Company. The machinery had been blown down by the late gale, and as the same thing had happened in many parts of the line, there had necessarily been some delay in replacing it. During this interval the signalman nodded. He opened the points to allow the mineral train to pass into the siding, and, having opened them, he forgot to close them again. They were consequently still open when the express train came up, and, this being so, the express necessarily ran at full speed into the same siding in which the mineral train was standing. The deaths and mutilations which followed are plainly due to the signalman's forgetfulness. If he had done his duty, the points would have been closed as soon as the mineral train had gone over them, and the express train would never have left the main line. Under such circumstances, no moral responsibility can attach to a Company.

If this were a complete as well as an exact statement of the facts, no fault could be found with the conclusion. The accident would take its place among the unavoidable calamities which are from time to time met with in railway travelling. Is it quite clear, however, that when the disaster has been traced home to the omission of the signalman to close the points, the distribution of blame is complete? Before this question can be answered satisfactorily three things have to be considered. In the first place, there is the unfortunate signalman's assertion that his box was not "kept private enough." Of course a statement of this kind, made in the first horror of discovering the destruction which his omission to close the points had wrought, must be taken with due reserve. A man who suddenly becomes aware that some act or omission of his has caused an express train to run into a goods train will instinctively try to make out that his fault is less than it appears to be. He can hardly believe that all this ruin has been brought about by himself alone, or that his carelessness has really been as inexcusable as it has been fatal. In this instance the signalman had, it seems, been talking to a fellow-servant just when he was busy in opening the points for the mineral train; and it is not wonderful that, after the accident had happened, this fact should assume in his memory a very different complexion from that which it would have worn if the express train had gone safely on its way. The conversation thoughtlessly begun might become an interruption thrust upon him against his will, and so go some considerable way towards relieving his conscience of the burden thrown upon it by the results. Still, though large allowance should be made for the strength of the temptation to make out some excuse for himself, the signalman's complaint ought not by any means to be lost sight of. It is at least conceivable that the rules of the Midland Company as regards the interruption of signalmen are either not sufficiently stringent or not properly enforced. The function belonging to the place is so important that every possible protection ought to be given to those who have to perform it. They should be defended alike against themselves and against their companions. They should know that, if they talk while they are on duty, they are guilty of an offence which, if detected, will at once be punished by dismissal, whether it is or is not followed by any disaster; and every other servant of the Company should be equally aware that the same measure will be meted out to any one who is a sharer in the transgression. It is

quite possible, of course, that the rules of the Midland Railway do effectually provide this safeguard; but the want of it alleged by the signalman will be a proper subject for investigation.

In the next place, if the omission of the signalman is accurately described, it seems to suggest that he had not been instructed to take sufficient precautions against the occurrence of this particular accident. He is blamed for neglecting to close the points after the mineral train had passed into the siding, and it is plain, of course, that, but for this neglect, the express train could never have got upon the line on which the mineral train was standing. But, if the signalman committed a sin of omission only, it would have been almost equally impossible for the express to leave the main line. How came the signal not to be standing at danger while the points leading from the main line to the siding still continued open? Had this simple precaution been observed, no harm beyond a little loss of time would have come to the express train. The signal, which must be assumed to have been standing at danger so long as the mineral train was itself on the main line, would have remained at danger until the signalman had come to an end of his conversation and bethought him that the driver of the express train might be waiting for the signal which should tell him that the points were closed and that he might come on without fear. The mistake, therefore, really lay in altering the signal from danger before the points leading into the siding had been closed. It may be that the misdescription, which makes it to lie in the omission to close the points after opening them, is merely a blunder of the reporter's. But it may also be that the directions given to the signalman were faulty, and that, in order not to delay the express train, he was permitted or ordered to take that as done which he meant to do, and to move the signal from danger while the danger to which it ought to have pointed had been guarded against only in intention.

In the third place, it may well be doubted whether the temporary absence of the mechanical security which the system of interlocking points usually provides ought not to have been treated in a much more serious way. The fact that a signalman is accustomed to a system which relieves him of all responsibility for the nature of the information conveyed by the signal is in itself calculated to unfit him for a system under which that responsibility suddenly revives. Perhaps this very man had for years known that, as soon as the points were opened, the signal marked danger, as a matter of course, and that so long as the points remained open the signal would go on giving the same warning. It is not very strange, therefore, that during the few days when he had to move the signal as well as the points he should once forget to do so. He was expected to break through a habit, and to remember, every time he opened or shut the points, that this action did not exert its customary mechanical effect on the position of the signal. The lives and limbs of railway passengers and railway servants ought not to be left dependent on the chance that this recollection would always be present to him. After the semaphore had been blown down the drivers of express trains should have been instructed to slacken speed when passing the places at which the mechanical warning usually given them was no longer to be had, so that, if the signal should turn out to be misleading, there would be time to bring the train to a standstill before any harm had been done. No doubt this precaution would have involved some temporary disturbance of the Company's arrangements. They would not have been able to run their trains quite so fast, and they might even have been prevented from running quite so many in the day. But an inconvenience of this kind would have been of no moment by the side of the disaster which followed upon the neglect of any such precaution. Speed and regularity are matters of real importance in railway management; but their importance is altogether misunderstood if they are regarded as substitutes for safety, instead of as means for ensuring it.

#### LE SAGE AND THE SPANIARDS.

THERE ought, properly speaking, to be no more entirely dead and forgotten literary question than the originality of Le Sage. It was natural that it should once have been doubted. A writer who avowedly took much from little known foreign sources laid himself open to charges of plagiarism where he was wholly innocent. He would have been accused of it even by indifferent critics, and Le Sage was too little scrupulous about offending his contemporaries not to have made his critics in many cases hostile. It was a pleasant revenge for Voltaire to accuse the writer who dubbed him with the ridiculous name of Triaquero—i.e. maker of Venice treacle or quack chemist—of having stolen *Gil Blas* bodily from *Marcos de Obregon*. The accusation was not the less easily made because Voltaire had obviously never even seen the work of Vicente Espinel, and does not so much as give its mere title with a decent approach to accuracy. As a matter of course, smaller men were content to echo Voltaire, and the Spaniards did so more loudly and more sincerely than others. The charge was kept alive by the obscurity of Le Sage's models even more than by the fame of *Gil Blas*. So little was known of the *novelas picarescas* that the defenders of Le Sage were cautious about making assertions concerning a class of books of which they had necessarily little knowledge. No critic who has as yet contrived to gain a hearing has been able to defend Le Sage in the proper way—by a comparison of his writings with the Spaniards, and a demonstration of their entire difference in spirit. We are not at this moment referring to *Gil Blas*. That

work nobody, even in Spain, possessed of the knowledge which entitles him to an answer, now believes to have been a translation. The other books, such as the *Estevanillo Gonzales* and the *Guzman d'Alfarache*, afford abundant proof of the originality of Le Sage.

Mr. Saintsbury, the author of the last contribution of importance to the large literature which has been collected round the author of *Gil Blas*, has, from the mere internal evidence, proved the originality of Le Sage's masterpiece as far as it now needs proof, though we think he rather over-estimates the amount of the other works which is taken from Spanish writers. Mr. Saintsbury is careful to declare that he does not speak with authority on the Spanish writers; but the perfect accuracy of what he does say about them shows that, had he not allowed himself to be unduly irritated by an assertion of Mr. Pattison's into laying more stress than is just on the mere style of Le Sage as an element in his popularity, he would have more fairly defined his relation to the authors of the *novelas picarescas*. The Rector of Lincoln's saying, that "mere style cannot confer immortality upon any book apart from its contents," illustrated by a judgment on the *Provinciales* and *Penées* of Pascal with which Mr. Saintsbury cannot agree, has provoked him into some assertions to the contrary with which we, for our part, cannot agree. Mr. Saintsbury, after pointing out the dangers of exaggerating the influence of style, goes on to lay it down that "the attitude of men's minds changes singularly from one time to another with regard to any 'contents'; it changes very little with regard to the expression of those contents." Mr. Saintsbury illustrates this opinion, which is at least as hazardous as Mr. Pattison's, by citing, first, the unique popularity of *Robinson Crusoe* among the works of Defoe, and then the especial popularity of *Gil Blas* and the *Diable Boiteux* among the works of Le Sage, and attributing it to their style alone. To our mind the difference between these eminent critics is purely imaginary. It is hard to see how there can be any merit of style apart from solidity of "contents," unless it is true that, in literature at least, the making of silk purses out of the material proverbially unfit for the purpose is a mere question of the proper use of the needle. But we are not concerned at present to argue the general question. Our business is with the illustrations cited by Mr. Saintsbury. He says:—"Between the merits of the contents of Defoe's different novels there is not very much to choose; yet no one who speaks with competence will question that the literary art of *Robinson Crusoe* is, on the whole, far superior to that of *Moll Flanders* and *Colonel Jack*." At the risk of being ranked with such as speak without competence, we venture to question the accuracy of this explanation of the popularity of *Robinson Crusoe*. This, as it seems to us, is quite sufficiently accounted for by the pathos of his lonely struggle on the island, which is a matter of "contents." We at least can find no superiority in other respects, either to *Colonel Jack* and *Moll Flanders*, or to the *Memoirs of a Cavalier* and *Captain Singleton*. The natural connexion there is to every Englishman between Defoe and Le Sage would excuse the space here devoted to the former. But Mr. Saintsbury's use of *Robinson Crusoe* as a parallel case to *Gil Blas* gives the question of the reason for the popularity of the former a direct bearing on the subject. After attributing the fame of *Gil Blas* and the *Diable Boiteux* entirely to their style, he enforces his judgment by saying that, as regards the contents, *Guzman d'Alfarache* "has perhaps a positive advantage over much" of *Gil Blas*. Now *Guzman d'Alfarache*, in incidents, is the least original of the stories of Le Sage, and what advantage it may have as a story over the others will therefore be due to what he took from Mateo Aleman. Perhaps that is a thing which every man must decide for himself. What a reader finds interesting must depend at least as much upon him as upon the book he is reading; but the judgment of the world scarcely bears out Mr. Saintsbury's. We can hardly accept his opinion that the style alone has given *Gil Blas* and the *Diable Boiteux* their popularity. By what possible test can it be shown that either of the two is better written than, for instance, the *Aventures de Beauchêne*? That book has all the "science prodigieuse du procédé" which is to be found in all Le Sage's writings. It fails to interest because of the "nullité presque absolue de l'inspiration" which makes it dull. And what inspiration failed to give Le Sage here was character and truth to life.

What constitutes the real originality of Le Sage is the way in which he took the stock figures of the *novelas picarescas* and made them so marvellously human and true. His superiority is shown, too, in the entire difference of his intention from that of the Spanish writers. Mr. Saintsbury has justly attributed much of the charm of Le Sage to the absence of any intention "to get into the pulpit and preach"; now the great, the avowed, object of every author of a *novela picaresca* is exactly to get into a pulpit and preach. The only exception, and he is but a doubtful one, is Quevedo. But the *Gran Tacuño* of Quevedo is a work of such ferocity of satire, and dwells with such obvious delight on the merely base side of human life, that we doubt whether any one would care to read it a second time. A writer who drew men as Swift drew them, with inferior genius and in the most jerky of styles, can only live as a literary curiosity. The didactic intention of the other is openly avowed. The very title-page of Mateo Aleman's *Guzman de Alfarache* explains why this work, which was in its day more popular than *Don Quixote*, has become unreadable, or readable only with the assistance of an editor. The author's intention was to call his book the "*Atalaya de la Vida*," the Beacon of Life, and to make it in fact a moral treatise. His way of effecting his object was to put into the mouth of Guzman long preachments to

follow each of his adventures. If any one who cannot read Spanish wishes to see for himself what it was that Le Sage did for the *novelas picarescas* he can do so by taking the volume of Ribadeneyra's collection of Spanish authors, which contains *Guzman de Alfarache*, and if he looks down its double columns a glance will show him that almost every alternate paragraph is headed by a *Q.* These are put in by the judicious editor to warn the reader off a long sermon worthy of a barefooted friar with a fluent command of classical commonplace. All this, or nearly all, Le Sage struck out, retaining only the few passages of solemn morality which stand out so curiously in his *risaccimento*. That he kept even so much was perhaps due to his respect for Mateo Aleman's singularly flowing and fine Castilian. This respect for his author is also perhaps the reason why Guzman retains, more than any of Le Sage's other heroes, the features of the Spanish *pícaro*. He has, almost unchanged, their cheerful spontaneous roguery, joined to a weakness for what Ford calls "the Castilian vice of twaddle." This truth to the original is very far from being to his advantage. If we compare Guzman to even Estevanillo Gonzales we see at once that the latter is a human being, the former a mere puppet. The Spaniards, whether in their stories or on their stage, were very indifferent to the human truth of their characters. With them the interest was wholly in the incident and in the moral lesson to be drawn from it. For the sake of the incidents they make their hero a scamp on one page and a hero on the next, with complete indifference to the inconsequence of so doing. As for the moral lessons, there is no literature in the world so overrun by "l'horéie de l'enseignement" as the Spanish of the seventeenth century.

Even where Le Sage is most closely following a Spanish writer, the incidents undergo in his hands a subtle change of spirit which gives them a complete originality. The frank manner in which he acknowledges his indebtedness should have been enough to defend him from the charge of mere plagiarism; but, if he must be otherwise defended, the best way is to take any of the incidents he has confessedly borrowed and compare them with the original. The story of the muleteer of Oacabelos is as good an example as any. This adventure is taken from the *Marcos de Obregon* almost word for word up to the point when the muleteer is brought before the judge. Here Vicente Espinel has nothing better to give us than a ponderous eulogy on the authorities of his time. There is nothing answering to the *malice* of Le Sage. "Le juge l'écoute, et, l'ayant attentivement considérée (l'Asturienne) jugea que l'accusé était indigne de pardon." It has been said that the preface of *Gil Blas* was taken from the *Marcos de Obregon*, and even so accurate a writer as Ford has made this mistake. What Le Sage has really done is to take the mere form and give it a life of his own. In the Spanish work two students find a tombstone, on which are carved twice the words "Conditor unio." One laughs at the inscription and goes on his way. The other opens the grave and finds there the skeletons of the lovers of Antequera, with a pearl of price round the neck of the woman, which he sacrilegiously appropriates. We all know what Le Sage substituted for this. He has also suppressed not a little moralizing. The two prologues, so like and so unlike, fairly illustrate the entire difference of spirit between the works of Le Sage and the works of the Spaniards. It is characteristic that Vicente Espinel should have opened his work by referring to a legend of his own country of the Ronda; but it would require a comment of some length to make a foreign reader understand all that the story of the lovers of Antequera means to an Andalusian. Who needs the aid of any annotator to understand the bag of doubloons wherein lay buried the soul of the licentiate Pedro Garcia? Vicente Espinel and all his countrymen think first of what makes a striking story, and the more entirely Spanish it is the better. If they are read and enjoyed beyond Spain, it must be as an acquired taste, seeing the intensely national character of their work. Le Sage speaks to all the world, not because he is less national than Vicente Espinel or Mateo Aleman, but because he is truer to human nature, and it is that which makes his work universal. There is a further test of the originality of Le Sage proposed by Ford, which is perhaps the most convincing of all. It is only within the reach of those who can read Spanish, and are therefore least likely to need it; but it is absolutely decisive for them. Let any one who can do so read the Padre Isla's translation of *Gil Blas*, and then ask himself whether or not it is the work of a Frenchman. We imagine there could be but one answer.

#### ENGLISH LANDSCAPE.

IT may perhaps be said, without being too fantastic, that England is the only country where nature paints her landscapes in water-colours. In those parts of Europe and America which are most eminent for picturesque beauty the eye is so much occupied by the grandeur of outline and by the colossal lines of the landscape that it scarcely notes the absence of those intimate points of detail that animate almost every rural scene in Sussex or Devonshire. Yet this lack is one which gradually makes itself felt, and is at the bottom of much of that indifference and even repugnance to sublime mountain scenery which the English traveller so often experiences towards the end of his autumn holiday. Long ago Mr. Ruskin advised the Alpine climber who felt himself fatigued with the vast outlines of the mountains to stop at once, and, withdrawing his eyes from the distance, to rivet them on a tuft of edelweiss or a cluster of

gentians. Yet these flowers form, on the whole, but a very unsatisfactory foreground; and in Norway, which is perhaps a type of the country which is purely picturesque and never pretty, the traveller who wishes to descend from the infinite to the particular has nothing better to look at than a heap of rubble or a hummock of coarse grass. It is this that has made the fast-fading beauty of the Cumberland lakes so enjoyable. Here, perhaps more than anywhere else in Europe, the sublimities of landscape were combined with a foreground full of minute and sequestered charm. Broad atmospheric effects, to use a painter's phrase, were dashed in in the background and middle distance, while the foreground was elaborately supplied with agreeable detail. But in counties less remarkable for natural beauty than Cumberland something of the same peculiar charm is found, as fresh and untouched as ever. The march of civilization has not yet introduced it to the notice of the London rough, and it is so unobtrusive and so indefinite that no swarms of tourists are ever likely to disturb it with their uncouth homage. When all Wordsworth's country is one huge hotel, when the Thames is entirely given up to steam-launches and the irrepressible Arny, when Stonehenge is restored, and all the rivers of Yorkshire destroyed with poisonous dyes—the sleepy dingles of Kent, the old thatched hamlet, and blossoming orchards, the mills in the angles of the streams, the rural corners of all those parts of England which are still obstinately blind to their powers of political obstruction, will retain their beauty for the few who care to enjoy it.

This special charm of English landscape has produced within the present century a whole class of artists who have been more or less faithfully its expositors. These men perceived that the quality of our native scenery was very delicate and volatile, and from the first they began to record it in the art of water-colour. The over-varying tone of a country landscape is perhaps better given in this way than in oils. Our most successful landscape painters in this latter medium have chosen to compose their landscapes with a conscious intellectual aim. Gainsborough and Crome have treated English scenery not without an evident thought of Gaspar Poussin and of Rubens. Of Turner, whose all-sidedness puts him out of court as a witness in either case, this at least can be said, that very early in his career he comprehended the necessity of composing his slightest sketches, and voluntarily abandoned a purely realistic rendering of odd bits of landscape. But the modern school of water-colour painters, as represented by that Society which will celebrate next year its eightieth anniversary, has been on the whole indifferent to selected composition, and has done justice in a humbler spirit to the fragmentary charm of English scenery. Nowhere has nature more of delicate and liquid colour than in the South of England. At this very moment, over how many districts dedicated to the sacred pheasant has not the genius of Autumn thrown a mist of variegated beauty! It is not merely that the woods have clothed themselves in russet and amber, that the viburnums are flushing into scarlet and purple along every hedge, or that the fern is withering in rich tones of yellow over common and copse. There is a "brownier horror" spreading across the oaks, and, as Clough puts it—

One great glory of broad gold pierces the aspen,  
And the jewels of gold that were hung in the hair of the birch-tree,  
Pendulous, here and there, her coronet, nocklace, and ear-rings,  
Cover her now, o'er and o'er; she is weary and scatters them from her.

But, besides this accidental blaze of colour, there are other tints that need but soft sunshine at any period of the year to wake them into life. The least group of houses glitters among the trees or above the meadows with the warmth of old brick or the brightness of fading whitewash. If the village is what the Scotch call a "kirktown," the church accentuates the landscape for miles around with its shining spire or substantial tower. Above the village we take a "journey into the blue distance," as mysterious as any that Tieck or Poe ever dreamed of. And everywhere we feel that; while in other countries all is sacrificed to the emphasis of sublimity of the great lines of the landscape, here it is the fusion of refined tones, the unobtrusive harmony of detail, that so much delight the eye and give to the scene its peculiarly English character.

We have been led to this course of reflection from having turned over the pages of a very beautiful collection of Mr. Birket Foster's *Pictures of English Landscape* (Routledge & Co.), which originally appeared twenty years ago, and have now been reproduced in an *édition de luxe*. They are thirty in number, and, as engraved by Messrs. Dalziel, they form a remarkable tribute to the most successful of that school of water-colour painters of which we just spoke. Perhaps these fine India proofs, carefully mounted on Whatman paper, give an almost more agreeable idea of Mr. Foster's art than the original paintings from which they are engraved. Even at his best days, it was to be desired that Mr. Birket Foster's colour should be a little more pearly than it was and his tones less crude. In the engravings themselves, certain faults in the artist's design may still be discovered. His peasant-figures are needlessly clumsy, and are grouped sometimes with an awkward affectation. He has learned to render the foliage of the elm with a pleasing trickiness, and can hardly persuade himself to give up this advantage by attempting an ash or a beech-tree. But when we have admitted these mannerisms much that is truly charming and valuable remains to be admired. The artist's subtle feeling for rustic architecture, his sympathy for the poor, his curious love of unsophisticated company in sequestered places, are combined with an extraordinary sureness of eye

and fineness of touch. The designs before us display Mr. Birket Foster at the height of his genius. His art had not begun to be paltry or mechanical. Excess of popularity had not tempted him to work hastily and feebly, and no one had yet invented the process of chromo-lithography under which his designs have been so miserably vulgarized. He was going through a crisis in his artistic career, and passing the very point where he resolved to dedicate the experience which more than thirty years of work for the wood engravers had given him to the finer art of painting. For years after this, his beautiful little pictures were less known to the public than his designs in black and white, and his name occurs but once in the catalogues of the Royal Academy before the removal of that body to Burlington House in 1868.

We are not among those who find in the unbounded popularity of Mr. Birket Foster a proof that his excellence in landscape has been unsurpassed. Without naming half a dozen artists of the present day whose treatment in our opinion considerably improves on his, we have but to mention Cotman and Cozens and Girtin to indicate landscape painters in the past whose peculiar skill and delicate touch left his somewhat obvious processes far behind. Yet, with all its shortcomings, Mr. Foster's art has extraordinary merits, and not the least of these is the genuine and undiluted English feeling which he gives to his scenes. Of the thirty designs in the vellum-bound volume before us, there is not one which could be mistaken for a piece of any nation but our own. Unlike many of his brothers of the brush, "in spite of all temptations to belong to foreign nations," Mr. Birket Foster remains an Englishman. He might, as many do, have studied at Düsseldorf and become a Prussian; he might, in these days of Continental training, have sought the fashionable atelier of M. Aivazovsky and become a Russian; the annals of landscape-painting in the North of Europe show only too clearly how easy it is to be Italian. When the progress of civilization shall have improved off the face of the earth all the old mills and weirs and ramshackle cottages that now give beauty to the face of our country, the man whose pencil has preserved those features will deserve well of posterity.

We note at the end of this volume an announcement on the part of the publishers that this selection from Mr. Birket Foster may possibly be followed by one from the pictures of Frederick Walker and G. J. Pinwell. While heartily hoping that nothing will intercept the performance of this admirable intention, we cannot but express surprise that so long a time has elapsed since the deaths of these artists without the execution of any such scheme. It is nearly seven years since the painter of "The Mothers" passed away in his Algerian exile; it is nearly as long since we lost the creator of "The Earl of Quarterdeck"; and as yet nothing has been done to enshrine their memories, except what was performed soon after their deaths by the zeal of friends. Life passes so quickly in these modern days that already a generation has arisen that does not realize what these men did in English art! We should welcome no publication more warmly than one in which adequate renderings were given of the principal designs of Walker and Pinwell.

#### THE DISASTERS AT SEA.

THE disasters at sea caused by the recent heavy gales are perhaps in one sense less shocking than is such an event as the foundering some time ago of the *Princess Alice* in the Thames. Exceptionally heavy weather generally brings with it a history of wreck more or less tragic, and in this instance some of the history is certainly tragic enough. As frequently happens, one particular misfortune has drawn more general attention than have various others, which may have involved in the aggregate more widespread misery, but which have not been accompanied by the special circumstances that attract the public eye and ear. The interest which might have attached to other losses has been to a great extent swallowed up in that attaching to the destruction of the steamer *Clan Macduff*. The reasons for this are, in some sense, the same as those which lent a novel horror to the Thames disaster just referred to, as the security expected and felt in both cases is the same in kind, if not the same in degree. A passenger steamer may fairly be thought capable of weathering a gale which fishing-smacks can hardly be expected to withstand; and while loss in the one case may unhappily be regarded as not unforeseen, in the other case the news of disaster cannot but bring with it surprise as well as sorrow. It would be rash as yet to pronounce any definite opinion as to the exact nature and cause of the loss of the *Clan Macduff*; but there seems too much reason to suppose that the disaster can hardly be classed with unavoidable misfortunes. The accounts given differ in some particulars which may turn out to be important, but have a general consonance, and one published by a contemporary, and given by Mr. Ward, a comedian, who had started in the *Clan Macduff* with a dramatic company of eleven persons to fulfil an engagement at Bombay, gives a vivid notion of the disaster as it impressed one of its victims.

The steamer, it seems from his account, was to have started three days before the actual date of departure from Liverpool, Tuesday, October 18th, the delay being the result of the heavy weather. At six o'clock on Tuesday evening Mr. Ward heard the Captain say, "There is a heavy wind against us. I think we had better not sail to-night." They did sail, however, and at three o'clock on Wednesday morning the narrator was alarmed by the engines stopping, and by

the water rushing through the porthole in his cabin, and was reassured by the Captain's telling him that the engines had stopped to set down the pilot. Later on, the engines stopped again, and on this occasion one of the stewards admitted that there was something wrong. The owners, it may here be mentioned, have contradicted the statement of supposition that anything was wrong with the engines and steering gear, saying "that both were in thorough working order during the whole time the pilot was on board the unfortunate vessel, and this they are in a position to assert on the authority of the pilot, who reported that everything went well and satisfactorily until he left the ship. The idea that the steering-gear and engines were out of order might have arisen from the fact that the latter were slowed for nearly four hours to allow of the boat coming up to take off the pilot." It is perhaps conceivable that the dictum of a pilot as to the condition of a steamer's engines might be contested; but this is one of the matters on which, in the absence of further information, it is impossible to form a decided opinion. Nor, as we have said, is it easy even to guess what was the real cause of the vessel's loss. From Mr. Ward's account we learn that at a time when the chief engineer expressed, rightly enough perhaps, a hope that "she would be all right," the water "was six feet deep in the fire-hole, and there were forty men below trying to baffle out with buckets." Later on the men, who "had been baling up to their necks," gave in, and the Captain told the passengers to prepare for the boats. Meanwhile a flag of distress had been hoisted, and it would seem from the context, found and hoisted. "A full-rigged vessel passed us at this time a couple of miles away, but took no notice. Whether she saw us or not I do not know." The life-boat, and apparently three other boats, were broken to pieces in the attempt to lower them. Mr. Ward was in one of the boats, Number 5, which were safely lowered, and he bears a high testimony to the behaviour of the crew. "Excellent discipline was preserved by the crew, who all stood back and allowed the passengers to take to the boats." From another account we learn that the Captain, when he had seen the passengers out of the vessel, jumped himself with a life-buoy for one of the boats, into which he was hauled, and which "was lost sight of in the blinding spray." The chief officer then took command of the *Clan Macduff*, and had lights burnt and the fog-horn sounded during the night. "The vessel lay completely at the mercy of the storm. Her decks were washed from stem to stern, and she gradually dropped by the head." As the morning (of Friday) broke she "began to settle down aft, the water pouring in from between decks through the saloon." About two hours after upon on Friday the nineteen men remaining on the *Clan Macduff* were picked up by the Cork Liner *Upupa*, Captain J. M. Brown, which stood by the *Clan Macduff* until she suddenly disappeared, and then bore up for Plymouth, where she arrived safely on Sunday 23rd, "after weathering the fearful gale on Saturday night, during which two hundred head of cattle were washed overboard." Meanwhile the occupants of boat No. 5 had an extraordinary escape from destruction. A seaman named Ingram took command of the boat (which was 21 feet long by 6 broad), and seems to have steered it through the heavy seas with admirable judgment and courage. "We had only one oar, the other having been broken in keeping the boat off the side of the steamer." At daybreak, after a night in which the rain had fallen heavily, the broken oar and a blanket were rigged up by way of a sail, and at last Ingram sighted a steamer and managed to alter the boat's course. Finally those in the boat were picked up by the steamer the *Palestine* and brought back into the Mersey. One of the ladies in the boat had "felt so certain that they would all be lost that she drew all the heavy wraps she could obtain about her, in order that they might weigh her down and cause her to drown quickly." Of the twenty-five people who started in Number 3 life-boat, and amongst whom was the Captain, three only seem to have survived. Amongst the reports published as to the disaster is one purporting to come from the chief engineer, to the effect that he reported to the Captain the unsatisfactory state of the vessel in time for her to have made an anchorage, and that if "she had thus got into an anchorage it would have been found that her principal requirement was to clear the bilges." But thus far all the suggestions and accounts as to the cause of the loss of the *Clan Macduff* are more or less conflicting, and for the present we can only regret the loss and rejoice in the escapes effected. It is, perhaps, only fair to the owners to add that they state that "the steamer was well manned, thoroughly efficient, and equipped in every respect. She passed the Board of Trade survey for hull, machinery, and equipment prior to sailing."

It is pleasant to turn from the disasters of the *Clan Macduff* and of other vessels to the consideration of the cases in which prompt and daring help has been given to vessels in distress. Prominent amongst these is the saving of a Swedish brig off Hartlepool, by the Life Brigade, under the command of Mr. Wraite. The brig had driven on to rocks, and a rocket was fired carrying a line over the vessel, the crew of which had been forced to take refuge in the rigging. The gear, unhappily, got entangled and out of order, and then, in circumstances of much difficulty and danger, the Coastguard, "assisted by Captain Meldrum, of the steamship *George Cowland*, and Tom Reed, coxswain of the National life-boat," managed to make "a hawser communication with the vessel, along which the captain and crew of seven all climbed safely to the pier." This is, of course, one of many instances of the bravery and devotion in the saving of life at sea

which are shown whenever ships in distress are discerned off the coast, and which, recorded generally to some extent, find a special history in the pages of the Lifeboat Journal, the quarterly issue of which lies before us. This, besides various brief, but interesting, records of life-boat doings, and other more technical matter, contains a special fly-sheet drawing attention to the Wreck Register and Chart for 1879-80.

That the life-boat service is admirable and indeed invaluable cannot of course be doubted, and would not be doubted even if there were no special journal devoted to its interests. The heroism of life-boat crews is indeed a matter of universal knowledge, and is in welcome contrast to the stories, which are too often told, of ships which pass by on the other side of the way, to save their time rather than stop to help a comrade ship in distress. This selfish conduct has, it may be noted in passing, been most unhappily encouraged by a recent decision in the Admiralty Court, according to which every technical difficulty is thrown in the way of one ship rendering aid to another in distress. But, as has been said, the life-boat service and its doings scarcely need any praise. Since 1854 no less than 18,736 lives have been saved by the exertions of life-boat crews—a total, as the fly-sheet referred to points out, more than equal to the number of men who man the British fleet. But it is perhaps to be regretted that the statistics given or quoted in the fly-sheet have not been more carefully arranged. We are given the number of wrecks and the number of lives saved; but we find that the 2,519 wrecks registered really represent the damage done to 3,138 vessels, as all cases of collision between two or more vessels "are of course involved in one casualty." The fallacy of this is obvious enough, but will not of course detract from the very great credit due to the National Life-boat Institution and to all those who work under its authority. The fact remains that they have done, and continue to do, work which it is not too much to describe as heroic. Had the *Clan Macduff* been within reach of a life-boat of the National Institution, instead of having to trust to her own resources in mid-ocean, there might, no doubt, have been a different tale to tell of the fate of her crew. In the circumstances there is room for rejoicing in the fact that so many of the crew were saved; but there is also, unluckily, room for surprise and regret that a steamer, well manned and equipped, as the owners have stated, should have foundered in a gale which was successfully weathered by some ships of much lower register at Lloyd's.

#### CONVEYANCING REFORM.

ON the 22nd of August last the Royal Assent was given to an Act which, originating in the Upper House, slipped through the Lower almost unnoticed amid the turmoil and excitement of the Irish Land Bill. Possibly its uninviting title and technical wording helped to facilitate its passing by encouraging the idea that it was a purely formal enactment of no general interest. This, however, is not the case, and though the Conveyancing and Law of Property Act, 1881, will on its coming into force on the 1st of January next make itself most felt by conveyancers and solicitors, it offers such advantages to all who have to avail themselves of the services of these gentlemen that it seems desirable that the public should be made cognizant of the impending change, especially as the absence of discussion precluded the world at large from acquiring familiarity with the details of the measure.

Very briefly stated, the main objects of the Act are—first, to abolish or modify the intolerable volume, prolixity, verbiage, vain repetition, and consequent expense which have for ages characterized legal instruments relating to landed property, which have encumbered and impeded anything like freedom of transfer, and afforded matter for wonder, scorn, and derision to all non-professional persons; and, secondly, to supplement this reform by the introduction of certain salutary, if not very fundamental, changes in the law touching land and the various interests therein. Incidentally, the Act involves an unambitious effort at codification, inasmuch as it repeals portions of divers Acts bearing on the same subject-matter and embodies their main provisions in itself, incorporating, moreover, a good deal which has come to have the force of law by reason of successive judicial decisions. The Act commences with the usual preface of a very long and very sweeping interpretation clause—so sweeping, in fact, as to raise serious doubts as to whether the subsequent provisions of the Act can well be made applicable to all the subjects to which by this interpretation clause their operation would be extended. Thus at the very outset property is defined to include real and personal property, whereas Section 3, to which we shall presently refer, is obviously only framed with relation to real property, although in terms it refers to property generally. The object of Section 3 is to render unnecessary the introduction of a number of common forms into contracts for sale. Enumerating seriatim a variety of conditions and stipulations usually imported into contracts for the purchase of land, it provides that in all such contracts these provisions shall be deemed to be incorporated, unless a contrary intention clearly appears on the face of the instrument. The condensation of these conditions is cleverly carried out, and is well calculated to facilitate the reduction of this particular class of documents within reasonable limits; but, as we have hinted before, an agreement for the sale of a horse is a contract for the sale of property within this section, and it is difficult to see the precise bearing of stipulations as to abstracts of title, fines,

discoveries, court rolls, and so on, with regard to such a transaction. This, however, is possibly a hypercritical objection easily dismissed by a well-regulated mind, and, at any rate, no harm is done. Sections 4 and 5 introduce two very salutary provisions with regard to contracts for the sale of land. Section 4 solves the difficulty which arises when a man enters into a contract for the sale of land, and dies before completion. In equity, of course, such a contract is held to change the ownership of the land from the date of its execution, and specific performance would be enforced against the heir or other person claiming under the original vendor. On the other hand, the executors of the deceased are the persons primarily liable to an action for non-completion of the conveyance, although it may be absolutely out of their power to carry out the sale. In order to remedy this, the section in question gives the personal representatives power, under such circumstances, to convey the property as fully as the deceased might have done—a course which has the additional advantage of tending to concentrate all matters connected with property, on the death of its owner, in the hands of persons selected by that owner. The other section referred to—Sec. 5—affords to the purchaser of land on which there are mortgages or other incumbrances the means of at once clearing the property of all such charges by the expedient of paying into Court a sufficient sum of money to meet or discharge them, the due application of which the Court undertakes to carry out.

The occasions on which such a power may be exercised with advantage are innumerable. Probably the most characteristic example would be that of a rich man of business who is anxious to become the owner of the family estate of an impoverished peer, which estate, by successive mortgages and charges for jointures and portions for younger children, has become the subject of a large number of interests, so that to get it clear in hand would entail infinite dealings with a whole tribe of vendors. All this the Act obviates, making the question purely one of money, and ensuring, by the supervision of the Court, that the purchaser is not driven into giving fancy prices in order to attain his object. But the section is not solely for the benefit of purchasers; vendors also may avail themselves of the machinery it provides, and, by doing so, may secure a way out of their difficulties.

After this deviation the Act returns to its primary business of simplifying and rationalizing our present system of conveyancing. Following the plan pursued with reference to contracts of sale, a series of well-drawn and comprehensive sections and subsections set out, in accepted phraseology, the usual enumeration of the appurtenances to lands, houses, or manors, and provide that the conveyance of any of these respective classes of property shall be deemed to carry with it all the specified appurtenances referable thereto. Then follow pages of similar matter, applying the same process to the ordinary and well-nigh invariable covenants, reservations, conditions, powers, and provisions, now inserted at full length in every settlement, conveyance, and mortgage, and at the same time ingeniously modifying their form, so as to render them practically applicable to almost any conceivable case. The infinite variety of such stipulations, and the saving of time and money which will be effected by their tacit incorporation into instruments whose bulk they would otherwise go to swell, can only be fully appreciated by those conversant with the practice of conveyancing; but a fair idea of the economy rendered possible by the Act may be gained by comparing the curt and simple forms of a Mortgage, a Conveyance, and a Marriage Settlement given in the fourth Schedule to the Act with the enormous pile of parchment which now testifies to any one of such transactions, and bearing in mind that the shorter document is to the full as efficacious as the longer, it being merely a question whether certain terms are expressed or understood. No doubt the examples given in the schedule are exceptionally favourable ones, inasmuch as they adopt the statutory provisions *en masse*, whereas probably in most cases some slight modification of some one or more of such provisions might be found necessary or advisable. Still he would be an extraordinarily fastidious settlor or vendor who could not derive from the provisions supplied by this Act a very solid substratum for the instrument embodying his dispositions.

Well devised and well carried out unquestionably this part of the Act is; the only question is, what measure of acceptance is it likely to find with the profession and the public? For the Act is in this respect absolutely optional; its operation may be totally or partially excluded or varied in any particular by the express terms of the deed, and it is specially provided that "nothing in this Act shall be taken to imply that the insertion in any such instrument, or the adoption in connexion with or the application to any contract or transaction of any further or other powers, covenants, provisions, stipulations, or words is improper." The only inducement held out by the Act itself to attract people to adopt it is a most legitimate one, consisting of a reasonable amount of protection extended to solicitors, trustees, and others who discard the usual formularies in favour of those instituted by the Act. It may be said that it is more satisfactory for persons who may be dealing with property to be clearly informed, by perusal of the document evidencing such dealing, as to the obligations they are really assuming and the full nature and effect of the transaction, and that this object is better attained by the present system of including every possible contingency within the four corners of a deed than by affecting the parties with certain statutory liabilities and rights in virtue of an Act of Parliament of whose very existence they may be blissfully ignorant. But the nature of the legal instruments in question defeats their object. The more carefully a layman were to study an ordinary conveyance, the more blankly

would his mind be confused by the legal jargon, the involved and ungrammatical construction, and the absence of stops to be found there. As a matter of fact, people seldom, if ever, attempt to master the contents of such documents; they rely solely on the authority of their solicitor in such matters, and the simple abstract of the provisions of the deed with which he furnishes them. It is difficult to see what other reasons could be alleged on behalf of the public at large against the general adoption of the Act; which is specially designed to save them money and risk. Solicitors and conveyancers, indeed, may fairly enough regard the measure with unfavouring, or at least distrustful, eyes. The late Mr. Joshua Williams, in his great text-book on Real Property, has some remarks on professional remuneration which may give a clue to the ground of this antipathy. He says, "The payment to a solicitor for drawing a deed is fixed at one shilling for every seventy-two words, denominated a folio; and the fees of counsel, though paid in guineas, average about the same. The consequence of this false economy on the part of the public has been that certain well-known and long-established lengthy forms, full of synonyms and expletives, are current among lawyers as 'common forms,' and by the aid of these ideas are diluted to the proper remunerating strength." To do away with common forms is, of course, the very object of the Act. As a sop to the solicitor, however, the Government passed an Act on the very same day as the Conveyancing Act, by which a Committee consisting of the Lord Chancellor, the Lord Chief Justice of England, the Master of the Rolls, and the Presidents of the Incorporated Law Society and of one of the Provincial Law Societies, may make general orders regulating and prescribing the remuneration of solicitors for conveyancing business; and if such general orders are judiciously framed, the result ought ultimately to be more satisfactory to both solicitor and client than paying and being paid by the yard. The conveyancers seem to be the only people left out in the cold; but we imagine that, as a body, they are perfectly capable of looking after their own interests. So that, on the whole, we may reasonably anticipate a general adoption, or at least a fair trial, of this portion of the Act, with probably distinctly beneficial results.

Beyond this, it is only necessary to notice some of the more important amendments of the law of landed property incorporated in the Act. Sections 10 and 11 deal very rationally with the technical difficulties apt to arise where the reversion expectant on a lease gets subdivided, by providing that all the rights and liabilities under the covenants in such lease shall attach to the person immediately entitled on its termination. Section 14 is a rather strong step in the favourite direction of the present Government, as fettering the freedom of contract, and advancing the interest of the tenant at the expense of the landlord. The section, which is retrospective in action so as to include existing leases, debars the landlord from enforcing his remedy by forfeiture of the lease and re-entry for the breach of any covenant other than one against assigning or for payment of rent, unless and until the tenant has omitted, on due notice from the landlord, to remedy the breach, if remediable, and make reasonable compensation for the same. The section further gives the tenant a general recourse to the Chancery Division in case he considers himself hardly treated in this respect by the landlord, and provides that no stipulation to the contrary shall be effectual to contract the tenant out of the rights so conferred upon him. This certainly seems carrying paternal legislation a little too far; the existing Equity rules have always been supposed sufficiently to protect the tenant from undue eagerness or severity on the part of his landlord, and the possibility of the latter occasionally reaping some benefit from the negligence or obstinacy of the former was regarded as a fair chance in his favour, analogous to the odds in favour of the bank at a gambling-table, or the gain made by a Railway Company where a passenger does not use the second half of a return ticket. The innovation is the more startling as the Act extends to Ireland—a country in which one might fairly think that enough had been done for the tenant just at present. Section 39, the last that we shall notice, gives the Court the power, when it shall see fit, to remove from married women the disability of dealing with their own property imposed by what is known as a restraint on anticipation. The doctrine of protecting property intended for the separate use of a married woman from her own extravagance or her husband's influence, by rendering it inalienable, is undoubtedly a wholesome one; but conditions may arise in which it is clearly for the lady's interest as well as that of her husband or family that a lump sum should be available; and it is these cases which the section is designed to meet, while the necessary intervention of the Court will afford sufficient guarantee that the original intention of the settlor is not disregarded save for good and substantial reasons.

The length of the Act—78 sections, every one of which contains subsections more or less numerous—procludes the possibility of dealing with it more in detail. It will well repay minute study as representing a comprehensive and praiseworthy effort to reform a branch of legal practice much needing reformation—an effort which, but for the danger of its having to encounter unreasoning prejudice and obstinacy, bids fair to attain its object.

## THE BANKING RESERVE OF THE COUNTRY.

THE revival of activity in speculation and trade has revived interest in the question of maintaining a larger banking reserve than has hitherto been maintained. Under our present system the Bank of England keeps the ultimate banking reserve of the whole country, and this reserve is so small that on several occasions already the Bank Charter Act of 1844 has had to be suspended, or the Bank would have been obliged to close its doors; yet it has not been taught by experience, and still keeps a very inadequate reserve. A fortnight ago it was under 10 millions. Last week it somewhat exceeded that amount; and this week it is again somewhat larger, but is still under 11 millions, and, roughly speaking, it is only a little over one-third of the liabilities of the Bank. This would be ample, perhaps, if the Bank of England were only one of a number of banks each of which kept a reserve for itself; but, when the reserve of the Bank of England is also the reserve of all the banks of the kingdom, it is entirely inadequate. In the United States every national bank is required by law to keep a reserve in cash equal to 25 per cent. of its net deposits, and the Bank of France keeps a much larger reserve still. With ourselves, however, the law is silent on the point, and the other banks are content with a state of things which is profitable for themselves. They undertake to pay interest on the deposits they receive from their customers, and they are naturally anxious to leave idle as little as possible of the money so obtained. Accordingly, they keep by them in actual cash only the amount of till-money which experience tells them is absolutely indispensable to meet their ordinary requirements from day to day. As, however, they are always liable to sudden and exceptionally large demands on the part of customers who keep very large accounts with them, they provide against this by lending out further sums at interest to the bill-brokers. The money is lent "on call," as the phrase is—that is to say, is repayable on demand—or for very short periods, as a day, five days, or a week; and whenever the lending bank has reason to expect an unusually large demand upon it, it calls in from the bill-brokers some of the money so lent out. The bill-brokers, being men of capital and credit, have no difficulty in repaying this money in quiet times, because, if one banker calls in, other banks are ready to lend. But the bill-brokers themselves keep no reserve. They pay interest for every deposit they receive, and as the competition for bills is intense, and the rates they are able to obtain are therefore only small, they cannot afford to keep a reserve of unused money; in other words, they employ the whole of the amount they borrow, and, accordingly, when a bank requires from them any of the money lent at call, they have no alternative but to borrow from some other bank. In times of crisis, however, it becomes impossible for the bill-brokers so to borrow, except from the Bank of England. Every bank is then calling in its money from the brokers, so as to provide itself against any contingencies that may arise; and unless the bill-brokers could borrow from the Bank of England, they would find themselves unable to meet the demand upon them, and would be obliged to close their establishments. Clearly, therefore, the money lent out to the bill-brokers at call and on short notice is not a reserve for the banks. The only other reserve which they keep consists of their balances at the Bank of England; but in strictness neither do these balances constitute a reserve. The principal banks in London are all members of the Clearing House, and the great mass of payments which they have to make are made by exchanging cheques through the Clearing House, which are settled by the Bank of England, the Clearing House bank. To enable this clearing system to be carried through, it is evident that the various banks forming the association must keep sufficient balances at the Bank of England; and therefore in strictness the balances so kept are but till-money. Some banks, indeed, are understood to keep balances larger than are required for Clearing House purposes, and the surplus so kept is, of course, a reserve in the strict sense of the word. But the banks which keep only the amount they deem necessary to meet their Clearing House engagements do not keep what constitutes a reserve. Thus the only banking reserve really kept in the country is kept by the Bank of England, and whatever payments the country has to make must be drawn from this reserve. If, for example, the Italian Government, having floated its loan for the resumption of specie payments, chooses to draw any of the proceeds from London, it is from the Bank of England that the gold would be taken, and this would reduce the reserve kept by the Bank. It is quite evident, then, that a reserve of less than 11 millions is entirely inadequate for the business of the country at present, and it is specially inadequate just now, when demands of various kinds may arise to reduce the reserve still further. Thus, should the difficulties of the Paris Bourse become intensified, there might be withdrawals of gold that would reduce very seriously the Bank reserve; or, were the drain of gold to New York to set in again for any reason, the reserve might still further be depleted.

It seems at first sight unreasonable to expect the Bank of England to keep a reserve for all the other banks and money-dealers of the country, who are, in their degree, every one of them competitors of the Bank. By keeping locked up idle in its vaults large sums of money it deprives itself of large profits that it might make. Accordingly the Bank has never officially recognized the duty resting upon it of keeping an adequate reserve for the whole country. It has always argued that the other banks should provide for their own liabilities; and, even while acting as the keeper

of the ultimate reserve of the country, it has in terms denied its obligation to do so. But, as a matter of fact, all things stand at present, it does keep the ultimate reserve of the country, and it has no option but to continue to do so. If it were to refuse, and in case of a panic were to allow other banks to become bankrupt, the panic would undoubtedly grow to such an extent that it would itself be placed in peril, if not actually compelled to close its doors. By the necessity of the case it is thus forced to act as the keeper of the ultimate reserve. Besides, as the bank of the other bankers, the keeper of their balances, it is constituted the keeper of their reserves. It cannot escape, then, from the obligation to keep an adequate reserve. And, on their part, the other banks contend that in fact the Bank of England does not keep the reserve at its own cost, but is provided by them with the funds which it holds against contingencies. As we have already stated, the other banks keep balances at the Bank of England, and they assert that these balances constitute at all times three-quarters, and sometimes the whole, of the reserve held by the Bank. There is some truth in this contention. In 1844, when the Bank Charter Act was passed, the London bankers' balances at the Bank of England were under a million sterling. They have steadily increased ever since, and in 1877 exceeded 9½ millions. Since 1877, unfortunately, the Bank has ceased to publish the amount of the balances. There is no law requiring it to give the information, but until 1877 it had always done so in compliance with an application from Parliament. Since 1877, however, it has ceased to publish the figures, and we are unable to say, therefore, how much the bankers' balances are at present; but it is believed that they are not less than they were in 1877, and that, in fact, they are just now little, if at all, less than the reserve kept by the Bank. During the time that the information with regard to these balances continued to be published, the balances occasionally exceeded the amount of the reserve; in other words, if the other banks had withdrawn their balances from the Bank of England, the Bank would not only have been left without a reserve, but would have been unable to repay the whole of the balances. This, however, was only occasionally. Usually the Bank held somewhat more than the bankers' balances; but the surplus was never very large. It is curious, in fact, that since 1844 the reserve held by the Bank has diminished instead of increasing, as one would have expected. As we have already said, in 1844 the bankers' balances averaged less than a million, and in the same year the average reserve was 8½ millions; in other words, deducting the bankers' balances, the average reserve was about 7½ millions. But in 1877 the bankers' balances averaged somewhat more than 9½ millions, while the reserve did not quite average 12½ millions—that is to say, the reserve, deducting the bankers' balances, was not quite 3 millions. It would seem, therefore, that since 1844, the reserve kept by the Bank, independently of the bankers' balances, has very greatly diminished. No doubt, it is to be borne in mind that the bankers' balances constitute a fund which is very rarely touched upon. As we have already explained, the object of keeping these balances is to facilitate the working of the Clearing House, and when payments are made through the Clearing House the real operation is very little more than a transfer of book debts. A payment made, for example, by the London and Westminster Bank to the Union Bank of London is merely a transfer of a credit on the books of the Bank of England from the former bank to the latter. The actual money remains in the Bank of England all the time. Therefore the Bank of England is fairly entitled to use the bankers' balances in lending and discounting, as Mr. Hicks Gibbs justly contends in a correspondence which passed some time ago between him and Professor Bonamy Price. There are occasions, however, in which the bankers' balances may be seriously touched upon, as was pointed out by Mr. Bagehot. For example, if the Italian Government has a credit with any of the London banks, it may at any moment withdraw a large amount of gold from the Bank of England, and yet the Bank of England cannot know what credit the Italian Government has with the bank in question, or to what extent it may be inclined to draw upon the balance standing to its credit. Up to a certain point, then, it is quite true that the Bank of England is justified in using the bankers' balances as a fund available for lending and discounting; but beyond that point it ought not to go, and it ought always to keep intact a margin for such contingencies as we have just referred to.

Various plans have been suggested for maintaining a larger reserve, but as yet without avail. The Bank of England, as we have already said, denies its obligation to keep the reserve for the whole country, and insists that the other banks are bound to provide for their own liabilities. On the other hand, the other banks contend that the Bank of England does not keep the reserve; that such reserve as it keeps is really made up of the balances which they maintain with the Bank of England, and that it is they, therefore, which keep the reserve. Without now entering into this dispute, it is sufficient from a public point of view to remark that, whoever keeps the reserve, that reserve is manifestly inadequate. The deposits of all the banks are measured by hundreds of millions, and the whole of the reserve kept against them is only at present under 11 millions, and seldom exceeds 15 millions. At this present time there are various liabilities which may reduce the reserve to a very serious extent at any moment; and a serious reduction in the reserve would create apprehension and anxiety in the City, and would give rise to a state of feeling which is always dangerous. Any accident occurring while such a state

of feeling existed might give rise to a panic leading to the most disastrous results. The Bank of England, then, ought to insist upon the other banks keeping a permanent reserve over and above the balances necessary for Clearing House purposes. The balances necessary for Clearing House purposes do not, we repeat, constitute a reserve. They are, in the strictest sense of the word, only till-money; the other banks ought clearly to keep, over and above this till-money, a reserve proper, and if the Bank of England were firm it would be able to compel them to keep such reserve. On the other hand, the other banks ought to insist upon the Bank of England maintaining the reserve which they supply separate from the amount necessary for Clearing House purposes. In order to this it would be necessary to distinguish in the weekly return published by the Bank of England the bankers' balances from the "other deposits." The effect both upon the Bank of England and upon the other banks could not fail to be beneficial; for the public would be enabled to see what the reserve really kept by the Bank of England was, and how much the other banks contributed to it. The Bank of England would then very soon find itself under the obligation of keeping a better reserve, and the other banks would also recognize their duty in the matter. As things now stand, each party disputes its own obligations, and in the meantime the essential interest of the country is neglected. It has also been suggested that the other banks should keep a reserve for themselves distinct altogether from the balances maintained by them at the Bank of England. This would be the best system undoubtedly if it could be introduced; but the difficulty is to induce the banks to make the sacrifice. At present they are unwilling to keep funds idle which they can employ profitably; and it is hardly to be hoped that they will voluntarily give up gains they have enjoyed so long without any apparently urgent need. To get over this difficulty it has been suggested that the reserve should be kept in Government securities. But Government securities in case of a panic would not be available for payments. Some institution would still be required to keep the means of lending upon them, and therefore the present obligation resting upon the Bank of England to maintain the ultimate reserve of the country would remain. It would, however, be much easier for the Bank of England if the other banks kept a reserve even in Consols in some reasonable proportion to their liabilities.

#### THE CAMBRIDGESHIRE.

ALTHOUGH the Cambridgeshire is supposed to rank on equal terms with the Cesarewitch, it is in our opinion a less interesting race. We care less to know which is the quickest horse over a mile than to learn what horse can distinguish himself best over a long wearying course of two miles and a quarter. Then, in a race only a mile in length, a bad start more seriously damages a horse's chance of victory than in one that is double that distance. In a large field of horses there are more possibilities of a horse getting shut in, or otherwise interfered with, than in one of moderate size. The fields for the Cambridgeshire are generally immense, and for the last half-dozen years their average has been about thirty-five. A glance at the results of the Cambridgeshire during the last few years will sufficiently illustrate its extreme uncertainty. Last year Fernandez, a heavily-weighted three-year-old, was the first favourite; but the race was won by the four-year-old Lucetta, who was carrying a stone less than the favourite. Fourteen to one was laid against Lucetta at the start, and her previous performances had certainly not appeared to entitle her to any higher position among the favourites. In the previous year the Cambridgeshire was won by a 30 to 1 outsider. This was La Merveille, a four-year-old, handicapped at 8 st. Three horses were within a head of each other at the winning-post, and they were all of them outsiders. In 1878, as much as 40 to 1 was laid against the winner at the start, and neither of the three leading favourites was placed. The winner afterwards proved himself to be one of the best horses of modern times; for, whether the distance was long or short, economy always seemed suited to his course. But little shorter odds were laid against Jongleur when he won the Cambridgeshire in 1877, and neither of the five leading favourites gained places in the race. In 1876 the first favourite won, but a 40 to 1 outsider ran within a neck of him. We have written enough to show that the public is not, generally speaking, very successful in foretelling the winner of the Cambridgeshire.

A handicap is a piece of work which is submitted to criticism like an opera, a novel, or a picture. Betting men, more especially backers, are its critics. When they make an exceptionally strong favourite, and that particular horse wins, their criticism is proved to have been a fair one, and the weak point of the work has been justly exposed; but when the public favourite is hopelessly beaten, and even more when none of the leading favourites are placed, the artist has the laugh at his critics. Although the length of the Cambridgeshire course is comparatively short, the pace is usually terrific; consequently the race is a tiring one, and high capabilities of a certain kind are essential in horses that are to compete for it with any hope of success. Moreover, at a critical point of the race, rising ground has to be ascended at very high speed, and considerable power is necessary for this purpose; so that, although the Cambridgeshire is not a great test of endurance, it tries a horse's speed and power at the same time. The distance—240 yards over a mile—is quite enough to render it something more than child's play. We would undertake to

say that most horsemen, such as ordinary hunting-men who are unaccustomed to race-riding, would feel considerably blown if they were to ride the Cambridgeshire course at Cambridgeshire speed, especially if they had to endeavour to get the most they could out of their horses at the end of it, although many people, who talk grandly about the deterioration of "our noble breed of horses," are fond of sneering at the Cambridgeshire as a short race. When criticizing the Cambridgeshire, people are apt to get puzzled about the relative weights for age over such a course at such a time of year. Weight for age, however, in the Cambridgeshire may be very briefly summarized, and easily remembered, in these few words—three-year-olds receive 8 lbs. There is really nothing more to be said. Over one mile in October, four-year-olds, five-year-olds, six-year-olds, and aged horses, all carry the same weight—namely, 9 st., and three-year-olds carry 8 st. 6 lbs. As two-year-olds do not run for the Cambridgeshire, it is needless to inquire what their relative weight would be over the distance. Although, at weight for age, there would only be 8 lbs. between any of the horses entered, the handicapper made a difference of 4 st. 7 lbs. between the highest and the lowest weight in the late race; 10 st. was a serious burden for Peter; but, on his best form, he deserved the weight. The probability, however, was so great that he would be left kicking at the post, that he was rarely noticed by backers. Even under 9 st. 8 lbs. Bend Or was greatly fancied. It was true that the Cambridgeshire had never been won under such a weight; but Bend Or was such a popular idol that he was backed for an immense amount of money. In the Champion Stakes he had had to do his best, or within a trifle of his best, to beat Scobell; and in the Cambridgeshire he was to meet Scobell on 10 lbs. worse terms than those under which he had defeated him with some apparent difficulty in the Champion Stakes. Then, at Newmarket Second October Meeting, one of his forelegs had looked most suspicious, and very serious doubts were entertained as to his capabilities of running sound to the Cambridgeshire winning-post. As regarded incendiary, the stable-companion of Bend Or, the preference, or supposed preference, of his trainer was considered sufficient evidence in his favour; but it was also remembered that in the Chesterfield Cup at Goodwood, over a mile and a quarter, he had run within a length of Victor Emmanuel, when he was handicapped on 17 lbs. worse terms with that horse than those relatively apportioned to the pair in the Cambridgeshire; moreover, he had beaten Prestonpans in the Chesterfield Cup by several lengths, at much the same relative weights as those allotted to them in the Cambridgeshire. As a four-year-old he was certainly not overburdened at 7 st. 1 lb. Prestonpans was a remarkably good-looking horse, but qualified critics were much divided in opinion as to his capability of winning under 8 st. 10 lbs. Lucy Glitters had been third for the St. Leger, but she has run in a very in and out fashion; yet on her best form she was quite the best handicapped horse in the race at 6 st. 7 lbs. Another uncertain horse was Tristan, but he seemed handicapped within two or three pounds of his very best form at 7 st. 9 lbs. It was true that he had run Foxhall to a head in the Grand Prix de Paris, but subsequent running tended to show that Foxhall was many pounds his superior. Under the crushing weight of 9 st. it seemed impossible to make Foxhall first favourite; nevertheless many good judges thought that he had considerable chances of success. His great power rendered him peculiarly suited for the Cambridgeshire hill, even under 9 st. He was handicapped exactly at weight for age with Bend Or, so that the race between the pair promised to be singularly interesting as a match between one of the best four-year-olds and one of the best three-year-olds of the season. Lord Falmouth's filly Muriel had won a Produce Stakes at the First October Meeting, beating Edelweiss and Zealot at weight for sex, and it was thought that she might perhaps have a chance under 7 st. 4 lbs., although it did not seem to be a very bright one. Elizabeth was a good deal backed at times, but she had not shown by her public running this season that she was likely to win a race like the Cambridgeshire, even under the moderate weight, for a four-year-old, of 7 st. 2 lbs. Then there was the broken-kneed Corrie Roy, who, as the Corrie filly, had been such a strong favourite at one time for the Cesarewitch. Distrusted as she was, some of her old admirers still clung to the hope that, under the nominal weight of 6 st. 2 lbs., she might outrun her betters when their heavy burdens began to tell upon them on the Cambridgeshire hill.

Peter delayed the start for a quarter of an hour, as is his wont whenever he appears on a racecourse; but when once the thirty-two runners had got away, they ran on very even terms for a few strides. After that Lucy Glitters made most of the running almost to the distance, where she swerved, thereby interfering with Tristan's chance as well as her own. This allowed Foxhall to come up, and although both Lucy Glitters and Tristan made a great effort to re-pass him, they did not quite succeed in doing so, and he just had his head in front as the trio passed the winning-post, Tristan being only a neck behind Lucy Glitters. Great credit is due to Watts for the judgment and resolution with which he rode the winner. We do not say that the race was won by riding; but we do say that worse jockeyship would have lost it, and the jockeyship of Watts on this occasion was as near perfection as possible. This was not the first time that both the Cambridgeshire and the Cesarewitch had been won by the same horse; but the Cambridgeshire had never previously been won under 9 st. That it was an extraordinary performance there can be no doubt; but it would be rash to infer from it that Foxhall is the best horse that

has ever trodden on a racecourse. At present he is in fine form, and Bend Or has a weak leg. When Bend Or was all right in the spring he beat Foxhall in the City and Suburban, when giving him a liberal allowance of weight. But there is an inference from the victories of Foxhall, Jongleur, and Robert the Devil, under extreme weights, in the Cambridgeshire and Cesarewitch, which appears to us perfectly reasonable; and it is this—that in these days there are horses which are so good that they cannot be handicapped out of a race with any fair weight, which ought to be a matter for congratulation to all those who take an interest in thoroughbred horses. No one ought to grudge the Americans their brilliant victories of this season on the British Turf, although it is reported that one American gentleman alone has won over 70,000*l.* from the English bookmakers during the year. We are not in the least afraid of the Americans bringing such horses as Foxhall and Iroquois to this country; what we do fear is that they may take them away again. It would be a matter for serious regret if Iroquois and Foxhall should leave England when the time comes for their establishment at stud farms.

Now that the two great autumn handicaps are over, we may conclude our notices of them by making a few remarks upon the question of their utility. We think there can be no dispute as to their being great incentives to gambling. It is all very well to argue that if they were abolished people would gamble on something else. Without doubt they would; but if there were no Cesarewitch and Cambridge, many thousands of pounds which are lost and won over those races every year would not be betted at all. Yet, as races, putting the question of betting on one side, these two great handicaps appear to us to be quite justifiable. When horses have raced at weight for age during the season, and have been honourably beaten, it seems very reasonable that their owners should be given an opportunity of gaining a prize by having them so leniently weighted that they may fairly hope to beat their former victors. Moreover, to the non-horse-owning public—to use an expression common among trainers—these great handicaps are intensely interesting. It has often been said that there is no interest whatever in a handicap apart from gambling. We think otherwise, and can only say that an experience of many years has practically convinced us that what Admiral Rous used to call “the game of weights” can be thoroughly enjoyed over the Cesarewitch and the Cambridgeshire, without wagering a sixpence, or even without the possession of a betting-book.

## REVIEWS.

### THE HAIGS OF BEMERSYDE.\*

SHORTLY before Sir Walter Scott left his cherished Abbotsford for Italy, whence he was to return home only to die, he was visited, as his biographer narrates, by “the great artist Turner, whose errand to Scotland was connected with the collective edition of Scott’s poems.” Among several little excursions made by host and guest during this visit was one (in which they were accompanied by Lockhart, Skene, and the publisher Cadell) to Smailholm Crag, the scene of one of the most popular of Scott’s ballads, and to Dryburgh Abbey. “We have nothing left of Dryburgh,” he had written a quarter of a century before in the autobiographical fragment prefixed to Lockhart’s *Life*, after recounting the sale by his maternal grand-uncle of that part of the estate which comprehended the Abbey ruins, and which had actually been settled on Sir Walter’s father, “but the right of stretching our bones, where mine may perhaps be laid ere any eye but my own glances over these pages.” A more potent presentiment than this was upon him in 1831, after the serious warning he had received early in that year; and on reaching Dryburgh, says his biographer, “he excused himself from attending Mr. Turner into the inclosure. Skene and I perceived that it would be better for us to leave him alone, and we both accompanied Turner.” But a more cheerful episode was to follow. “Lastly,” continues the narrative, “the painter must not omit Bemersyde. The good laird and lady were of course flattered, and after walking about a little while among the huge old trees that surround their tower, we ascended to, I think, the third tier of its vaulted apartments, and had luncheon in a stately hall, arched also in stone, but with well-sized windows (as being out of harm’s way) duly blazoned with shields and crests, and the time-honoured motto, *BETIDE, BETIDE*—being the first words of a prophetic couplet ascribed to Thomas the Rhymer:—

Betide, betide, whate’er betide,  
There shall be Haigs in Bemersyde.”

And a little later—only a little later—in his biography, Lockhart relates how, when Scott was carried to his last resting-place in Dryburgh Abbey, some accident “caused the hearse to halt for several minutes on the summit of the hill of Bemersyde—exactly where a prospect of remarkable richness opens, and where Sir Walter had always been accustomed to rein up his horse.”

An engraving of the sketch taken by Turner on this occasion, which represents Bemersyde House as it was between 1796 and 1859, and the figures in which include those of Sir Walter Scott and his biographer, serves as a charming frontispiece to the

volume now before us. In it Mr. John Russell has narrated, with a judicious combination of brevity and fulness, the fortunes of a family which has many claims upon the interest of Southern as well as of Scottish readers, besides its near, though not always amicable, relations to the ancestors of the great Romancier of the Border. “Of the hundreds of forts and castles which once existed” in that district, writes Mr. Russell, “Bemersyde is the only one that is still inhabited as a manorial residence, and inhabited, too, by the family that were its original founders.” The family papers of the Haigs of Bemersyde range back from the present time to the year 1162 (those in the family charter-chest dating from 1425 onwards), while tradition carries back the continuity of the line three centuries more. There is no main stage in the legendary or historical life of the Borderland in which this family has not taken either a conspicuous, or at least an active, part; and yet it has never become possessed either of wealth or of honours such as to make it no longer typical of the social class to which it belonged. Thus what Mr. Russell has in this volume accomplished, with not less care than zeal, is a record which in some respects it would be difficult, and in some impossible, to parallel. Only the other day M. Gustav Freytag completed—not without some natural signs of weariness at the last—an ambitious, and on the whole successful, endeavour to mirror the principal phases in the political and social history of a great nation in the fictitious narrative of the fortunes of a single family; and no less exacting a critic than M. Julian Schmidt tendered to his friend the thanks of every German patriot for his national work. Mr. Russell’s account, well authenticated in every particular, of the experiences of a long line of Borderland lairds, even more faithfully, though quite unpretentiously, reflects the course of their native country’s history during more than seven centuries, and is thus almost as full of fascination for the general student of Scottish history as it can be for the most eager and critical successor of the late Robert Mylne.

The present school of Scottish antiquarian research, of which Mr. Russell appears to be a thoroughly representative member, makes short work of the genealogical assumptions or conjectures of the seventeenth and eighteenth centuries. Mylne, who is occasionally found tripping, even when out of the twilight of prehistoric times, states in his MS. account of the Haig family, bearing the date of 1710, that it is acknowledged “by all our historians and writers” to be of “Pictish extract.” Without binding himself to an acceptance of his own conclusions, he professes to have based upon the statements of “our own histories and foreign writers” a genealogy showing the descent, in the seventh generation, from “Druskine, the last king of the Picts,” of “Petrus de Ilago,” who, being wrecked off Eyemouth, resolved “never to put to sea again, but to try his fortune in Scotland.” A Petrus del Hage appears as a witness to a charter probably dating between the years 1162 and 1166; and Mr. Russell, while unceremoniously throwing over King Druskine and his warlike progeny, inclines to the opinion that the founder of the family, as the suffix to the preposition before his name in the first charter containing it would seem to imply, came from the locality of Cape de la Hague in Normandy. In this case he was very probably one of those Norman knights whom David I. provided with lands in this very district in the days before the Battle of the Standard; and Bemersyde Tower may in some measure form an exception to the remark of the late Mr. John Hill Burton, that no remnant exists of a Norman castle in Scotland. Curiously enough, the name Haig, though it probably came to Scotland from Normandy, is, as Dr. J. A. H. Murray shows in an appendix to this volume, in all likelihood of Old Low German origin, since the word *haga* (an enclosure) occurs in this as well as in the Old High German and Old English branches of the language, and since numerous Saxon settlements are well known to have been formed at an early period along the French seaboard of the Channel.

The name of the first Petrus del Hage, Petrus de la Hage, or Petrus de Ilago, occurs with these and other minor varieties of spelling in divers other charters of the twelfth century; but it is not till the time of his son and namesake that, in a deed dated by Mr. Russell as belonging probably to the period from 1215 to 1220, Bemersyde appears in the possession of the family. Curiously enough, the owner of Bemersyde is found on this very occasion bestowing a gift of land upon Dryburgh Abbey; and there seems no reason to doubt the statement of Sir Robert Douglas, that it was in the time of this second Peter that the right of burial in Dryburgh Abbey was bestowed upon his family. Of the three divisions of this illustrious burying-place, that which belonged to the Haliburtons (now extinct) contains the grave of their representative in the female line, Sir Walter Scott; but the only one of the three of which the ownership has remained unchanged during seven centuries is that appropriated to “the most ancient family of Haig of Bemersyde.”

The friendship of the Church was of high value in the days of her prosperity, which coincided with what has been called the golden age of Scottish history; and the third Petrus de Haga (the fourth known representative of the line) is found substantially increasing the gift of land made to Dryburgh Abbey by his grandfather. His dealings with King David’s other foundation, the Abbey of Melrose, and with the chapel of the old convent which it had virtually superseded, we must leave to the learning and ingenuity of Mr. Russell to interpret; but the deed in which the lord of Bemersyde, with the consent of the Abbot and Convent, commutes the ruinous annual payment of ten salmon into that of half a stone of good and valuable wax, has an importance in-

\* *The Haigs of Bemersyde: a Family History.* By John Russell. Edinburgh and London: William Blackwood & Sons. 1881.

pendent of its contents. One of the witnesses to it is "Thomas Rymor of Ercildoune"; and as this is, according to Mr. Russell, the only instance of the mention of Thomas's name in a document of unquestionable authenticity (it occurs, however, also in his son's charter quoted by Dr. Murray), it might almost be said that he owes his survival as an historical personage to the family whose actual survival, according to popular belief, his prophetic utterance ensured. Mr. Russell, who points out this circumstance, takes some trouble to establish as the correct version of the Rhymer's prediction the following:—

Tyde what may betyde,  
Haig shall be Haig of Bemersyde.

Considering that in 1745 the Jacobites took comfort from certain of his prophecies very much obscure than this, it is not to be wondered at that in the prophet's own native district (for tradition places the site of the "Rhymer's Tower" only a few miles from Bemersyde) implicit reliance should have been placed upon his words. The house itself afterwards adopted them, or part of them, as its motto; and in 1680 Anthony Haig, while leaving it an open question whether his family was "left of the Pikes" or "planted by a familie" of the Scots, uttered a fervent prayer that "Thomas Rymores prophecies might hold treue of it." He had, to speak humanly, reason for his hope; for he was himself *the thirteenth child and only son* of his parents. When at last, in 1854, his great-grandson died without leaving a male heir, and the unentailed property passed into the hands of his unmarried sister (from whom it was again to pass to an unmarried sister), it was thought in the neighbourhood that something awful must needs happen. Nor was this apprehension destined to be altogether disappointed. When Mr. James Haig's funeral procession had reached the ruins of Dryburgh Abbey, "the very moment the feet of the bearers touched the consecrated ground, and the voice of the officiating clergyman" (from whose own statement this relation is taken) "was heard to utter the first words of the solemn service, a blinding flash of lightning leaped forth from the black line of cloud immediately above, followed instantaneously by a crashing peal of thunder; nor did the storm," the occurrence of which was quite unusual at the time of year, "abate till after the completion of the ceremony." As our readers are doubtless aware, "True Thomas" is True Thomas still; for on the death of Miss Sophia Haig at Rome in 1878, she was, according to a joint disposition made by herself and her two sisters, succeeded by a direct descendant of the Clackmannanshire branch of the family, the distinguished officer who is now Laird of Bemersyde.

A rapid and necessarily very far from complete attempt to indicate the most noteworthy points in the history of the Haigs of Bemersyde, from the close of the thirteenth to the close of the eighteenth century, may perhaps most fitly conclude this notice of a most interesting volume, and justify the confidence with which we commend it to all friends of good reading. There was, as we have said, no period in the history of the Borderland, and of the kingdom to which it belonged, that failed to leave its impress on the family annals. John, the son of the second Peter, had enriched the Abbey of Melrose by more important gifts than that promised by his father; but times had changed in the evil century that followed, and in 1422 we find his namesake, the fourth John, formally excommunicated by the Abbot of the same convent, as a Gentile pursuing the errors of his Gentilehood, on account of a piece of ground disputed between them. The quarrel was finally settled, through the mediation of the Earl of Douglas, by a jury of laymen, so that the excommunication had virtually only been one step forward in a process of litigation. The troubles in which the turbid politics of this and the following century involved the Haigs were of a graver nature. They seem at no season in this period of their history to have been missing from the thick of the fray. John de Haga, who, together with other Border chiefs and prelates, had sworn fealty to Edward I. at Berwick in 1296, had in the following year fought under Wallace at Stirling:—

When Wallace came to Gladwood Cross,  
Haig of Bemersyde met him with many good horse.

His son and successor is said to have been present at Bannockburn as a mere boy, and to have fallen at Halidon Hill while still in his prime. Another John, according to repute, fell at Otterbourne; and yet another (the excommunicated one) at Piperdean, in 1436, when helping a Douglas against a Percy, like his grandfather. Then came the troubled times of James III., and of the rising of his nobles against him in the name of his son, whom they proclaimed as James IV. The Laird of Bemersyde took arms for the King, and his eldest son for the Prince, and both bore part in the battle of Sauchieburn, in flying out of which like a craven James III. was killed by an assassin. James Haig was fortunate enough to be allowed to make over his estates by a deed of resignation to his son William, who in his turn fell on the fatal field of Flodden by the side of the beloved King to whom he had so faithfully clung. His successor, Robert Haig, was accounted a lawless man in an age of lawlessness; but he distinguished himself at Ancrum Moor in 1545, when he had to avenge the destruction of his own house by the English invaders, and when he is even said, in the private memoirs of the Haigs, to have made Lord Evers prisoner with his own hand. The English lord, this account continues, died at Bemersyde, whence he was taken to Melrose Abbey for burial. Lord Evers is, however, as Mr. Russell notes, usually supposed to have fallen on the field; and it would certainly have been strange had the desecrator of the tombs at Melrose himself been laid to rest among them. In any case, Robert Haig's loyalty, like that

of many another Border laird, was not proof against the temptations of the times, and he "took assurance" of the Protector Somerset (i.e. was certified a friend of England) only two years after the battle. Why he also gave up his estates to his eldest son, reserving for himself only a life-rent, it must be left to conjecture to explain.

All these dangers and difficulties, however they might have impaired the possessions and darkened the prospects of the family, had still left it standing erect among the ruins of many houses great and small around it. Its worst days—because days in which dishonour transiently blotted its scutcheon—fell in the reign of King James VI. (I.), to the scandalous private history of which the biography of James Haig contributes a fitting page. After a few years of reckless living he had resigned his estates to his brother William, already a lawyer of some eminence; but he soon repented the sacrifice he had made for the sake of the family, and began to plot his brother's ruin. Going straight to the fountain-head, he contrived to let the King know that William Haig had criticized and insulted a sovereign whom James himself esteemed "sibber than all the brothers and sisters he had in the world": and with these charges—quite in the spirit of the times and of the man he addressed—he combined some mischievous information about William Haig's dealings with a French astrologer who had predicted the death of Prince Henry and declared that the King's own "glass was almost run." Like so many scandals of the reign this was mixed up with the central scandalous mystery of the Overbury murder; for William Haig had recently committed the grave indiscretion of writing, out of pure "Scots kindness," a paper in favour of the fallen Earl of Somerset (himself the scion of a Border family). His arrest can, therefore, hardly have surprised him; but very soon his accuser was apprehended likewise, and both were sent down to Edinburgh, to await in the Tolbooth a judicial inquiry into their case. The picture of the two brothers preparing their depositions against one another, and each complaining that the other was better treated than himself, is one which a dramatist of the age might have turned to profitable account. In the end, after James Haig, who had to be maintained at the public expense, had characteristically demanded—like another Francis I.—that the matter should be put to the issue of *trial by combat*, it was brought to some sort of conclusion by the judges. What this conclusion was remains unknown; but William's character must have been completely cleared, as he afterwards held the office of Crown Solicitor; as for James, his father's curse had come home to roost. It was said that he died abroad; but authentic history knows of him no more. William Haig, on the contrary—though his life, too, was to end on foreign soil—was destined to leave a memorable name in the history of his country as well as of his family. It was he who in the year 1633 drew up the "Supplication of the Nobility and other Commissioners in the late Parliament," which was intended to warn King Charles I. against the policy of violence and illegality so disastrously commenced by him on his coronation journey into Scotland, and which was thus, in its way, a forerunner of the Covenant. The Supplication was never actually presented, but its contents came to light, and its author had to fly for his life.

William Haig died in Holland a proclaimed rebel, but owing to a fortunate arrangement it was possible for his estates—he was unmarried—which had previously been held for some years by his nephew Andrew, to be secured to a younger nephew, David. The second nephew, Robert, and several other brothers were passed over; but a descendant of Robert is at the present day in possession. Thus the inheritance after all remained in the line of the elder brother James; but his descendants were fortunately unlike him. David Haig seems to have made caution the rule of his conduct. His long residence in the Netherlands and his marriage with a Dutch lady, whose mother Mr. Russell oddly describes as "daughter of Maximilian, Earl of Hohenzollern"—we have failed, by the way, to identify him after a conscientious search—introduced a new element into the family history; nor did he permanently settle in Scotland till 1646, when he took up his residence in an old fortalice on the estate called the Thrid, Bemersyde House remaining (under an agreement delaying the Rhymer's prophecy) in the occupation of the Haliburtons. But its occupation was recovered for the family in the next generation by David's successor, Anthony. Thanks to his own extant MS. book of business memoranda, and to a few personal papers of a more elaborate kind, this Anthony Haig stands forth in Mr. Russell's pages with more vividness than any of his ancestors or descendants. Scott or Thackeray—each in his own way—could alone have filled up the outlines of the picture. Anthony had begun his years of manhood as "ane excommunicat Quaker," and his young wife had sat solitary at home while her husband was inditing ecstatic exhortations to her from the Tolbooth, where he was confined for not less than five years. But these were his wild oats; for the rest of his life, which lasted till 1712, he devoted himself, with a zeal which to Mr. Russell justly seems pathetic, to the improvement of his estate, and in the earlier years more especially to his project of repurchasing the house of Bemersyde, which in 1780 he actually accomplished. On a blank page of his family Bible—happily preserved in the fragment which remains of it—he records, for the benefit of his successors, how he "bought back the place of Bemersyde, our head house, which for many years had been out of the hands of our family, which I advise you never to part with as long as God will bless you with the Injoyment of a furrow [furrow] of land: It is your mother-house, and head of your

estat and family." His improvements do not appear to have beautified the ancient tower; but the estate owed much to his care, though his energy, according to the custom of the Border, could not avoid finding vent in a succession of lawsuits.

His nephew Obadiah, to whose hand is due the earliest document which attempts an account of the Haig family in genealogical sequence, would have been a son after old Anthony's own heart. His actual heir, whom in the days of his Quakerdom he had named Zerubabel, was of a less docile disposition; but the account of his contention with his father, and of his ultimate emancipation from the *patria potestas*, must be read in Mr. Russell's pages. Zerubabel Haig, notwithstanding his name, was afterwards, partly no doubt in consequence of his connexion by marriage with the Gordon family, a good Jacobite, like most of the Border lairds (his sword is still preserved, with "God bless King James the 8" on one side of the blade, and on the other, "Prosperity to Scotland, and no Union"); yet he contrived to keep out of the rebellion of 1715, as his son and successor James, more by good luck than by good intentions, was kept out of the 1745, till the news came that the Prince was on his way back from Derby. James Haig cherished his opinions, however, with the usual family tenacity, and was extremely wroth with his son and heir for seeking a commission in the Border Yeomanry which rallied round the throne of King George III. in the invasion panic of 1778. Once more the determination of youth prevailed over that of old age; and in 1780 James Zerubabel Haig, the last but one of the lairds of Bemersyde of his branch, exchanged from the Yeomanry into a regiment of the line. He left behind him a journal of a tour in France and other countries, from which Mr. Russell makes some extracts, and a diary, full of touching reminiscences, of his home life on the estate to which he succeeded in 1790. But his days (he died in 1840) were already in part in too close a proximity to our own to make it necessary to prolong our outline, which has unavoidably failed to do justice to the variety of information and entertainment contained in Mr. Russell's valuable and delightful volume.

#### MYTHS OF THE ODYSSEY IN ART AND LITERATURE.\*

THIS book is, as far as we know, the very welcome first fruits of the classical training of Newnham. Miss Harrison has attempted to produce a kind of novelty in English literature; a volume which combines mythology—the literary treatment of myths—and "mythography," a criticism of the same myths as illustrated by the artists of the ancient world. The materials for "mythography" are necessarily scanty. It was not the province of sculpture to tell a story in detail. The pictures of the old world have perished, and it is only from the descriptions of Pausanias and other travellers and critics that we can learn, and that dimly, how Polygnotus illustrated the Homeric Hades on the walls of the Lesche, or gossiping club, of the Onidians. In the absence of pictures we have vases, the paintings within sepulchres, funeral urns, and the mural decorations of Pompeii, Herculaneum, and the houses on the Palatine and Esquiline. Miss Harrison has studied these and similar documents with a great deal of attention, and her book contains much information that will be new to all but professed archaeologists. As M. Bitaudé said, in the preface to his French prose version of the *Iliad*, written exactly one hundred years ago, there is now a fresh and lively interest in Homer, and in everything that elucidates his meaning and the manners of his age. But, lest readers should be disappointed by Miss Harrison's book, we must mention the limits of her effort—limits of which she herself is perfectly conscious.

In the first place, Miss Harrison's work throws no new light on the myths of the *Odyssey* as they were accepted by the contemporaries of Homer. We possess, it is true, a number of works of Phœnician, Assyrian, and Egyptian art, of the sort with which Homer was probably familiar. The silver bowls of the Sidonians and fragments of ancient pottery, the wall pictures of Egypt and the carvings of Assyria, all illustrate the art that Homer knew. But these of course tell us nothing about the art of Greece herself in Homer's time, or about the contemporary Greek myths. The graves of Kertch have recently given up fragments of Greek raiment, beautiful and curious enough. But we can hardly expect even Dr. Schliemann to discover a portion of the web on which Helen embroidered the event of the siege of Ilios, as Matilda and her maidens wrought the tapestry of Bayeux. To recover some remnants of Greek art coeval with Homer (placing Homer, as Miss Harrison does, not later than the eighth century) is not, perhaps, beyond the reach of hope. But meanwhile our author has to be content with vases of which the earliest is at least three centuries later, with Etruscan illustrations, and with Roman pictures. Once more the comparative mythologist will find scarcely anything that helps his studies in Miss Harrison's book. "The express object of my work forbade my treating of the several myths in their purely literary form," she says; and adds, "I believe the materials for such treatment to be at present incomplete." We do not agree with Miss Harrison here, but she shows at least that she knows how Indian and Finnish fancy has dealt with the data which Homer weaves into the story of the Cyclops and Circe, and the Descent into Hades. The topic is one which we have occasionally touched upon, and, as Miss Harrison leaves the distribution of Homeric myths almost un-

noticed, we may possibly recur to it on some other opportunity. Lastly, Miss Harrison's discussion of the myths in the *Odyssey* is strictly limited. She does not deal with the central myths, at all, with the myths of the return and revenge of Odysseus, though she does show in a note that she is aware of the existence of a parallel story in the North American romance of "The Red Swan." The adventures in Phœnicia, too, she leaves on one side, and has no chapter on Calypso. She confines herself to the Cyclops, the Læstrygonians, Circe, the Descent into Hades, the Sirens, and Scylla and Charybdis.

It is not Miss Harrison's plan to describe the ancient illustrations of Homeric myths in chronological order. She observes with truth that in later Greek and in Roman art real illustrations of the poet's text were attempted, while the earlier vase-painters, like the dramatists, either treated the text more freely, or were inspired by some traditional version of the story. The process by which our *Iliad* and *Odyssey* became canonical, so to speak, while the other old epics dwindled into the place of the Apocrypha, was a long and slow one. Miss Harrison's first plate is from a bas-relief at Volterra; it is late, and represents Odysseus, with his sailor's cap, offering the wine to the Cyclops. Here, as is usually the case before Roman times, there is nothing to show that the Cyclops is one-eyed. In a bronze in the British Museum he has two blind eyes, and a small rudimentary one in the centre of his forehead. In an early cylix found at Nola (plate 4), the Cyclops is sitting with two human legs in his hands; his left eye is visible, and the companions of Odysseus are apparently thrusting the beam into his right eye. Here we must make an opportunity to complain of Miss Harrison's illustrations. They are too often the very weakest caricatures of ancient art. No inexperienced reader can look at them without inferring that if these things resemble Greek vases, the Greek vase-painters must have been on a level with the artists of the pavement in London. "Where we can look at the originals, no copy must suffice us," says Miss Harrison. But the copies should not be quite so tame as the first illustration, in plate 10, a weak sketch of a capital vase, or so absurd as plate 38. Here the most prominent siren is made to resemble a bald man in trousers, a long dress-coat, and a white waistcoat. In many other plates the drawing is simply execrable, and we almost think it would have been better to give no illustrations at all than to induce readers to suppose that the Greeks could not draw. Vases can be reproduced with some success, as in Dr. Birch's book on pottery, in the illustrations of the *Gazette Archéologique*, and in those of the *Journal of the Hellenic Society*. The process is expensive, but some firmer and more accurate outlines might have been produced than those which are offered us in Miss Harrison's volume. To return to the Cyclops, the earlier vases are tolerably rich in pictures of Odysseus and the Ram. From the Homeric Cyclops, Miss Harrison turns to the amorous Cyclops of Theocritus, as illustrated by Pompeian wall paintings, derived, as Helbig shows, from the Alexandrian school. Here we are a long way from the few twisted boughs that in the vases indicate a thicket. Landscape is now studied with some care. The high rocks, often stooping forward like those in Claude's pictures, the grottoes, the laurels, the houses on distant heights, are anticipations of the Italian landscape. Beneath a high rock crowned with laurels stands a Cyclops who, unlike Polyphemus in Theocritus, possesses both his eyes. His goats and his dog stray round him. He watches wistfully a sea-nymph who rides a dolphin, and a little Cupid flutters past carrying a long parasol. To this courtly condition the over-refinement of Alexandria reduced the Cyclops. In another picture (plate 15) the love-lorn giant receives from a Cupid, mounted on a dolphin, the letter of Galatea. A mural painting in the house of Livia, on the Palatine, shows the Cyclops in a more fortunate moment. A Cupid has harnessed him, as Brer Fox harnessed Brer Rabbit, and driven him into the watery floor of Galatea's cave. In Miss Harrison's illustration (plate 16) the Cyclops looks a foolish, amorous yokel. Galatea contemplates him from the back of a sea-horse. The whole story of the Cyclops' fortunes in classical art is briefly condensed in a passage which we quote from Miss Harrison:—

These paintings have also a special interest, because their relation with contemporary literature is close beyond that of any former age. Sculptors and vase-painters no doubt drew their subjects and something of their inspiration from epic poets and tragedians, with what freedom we have seen; rarely, if ever, does a dramatist seek in return inspiration from a work of art. In the Alexandrian days not only were art and literature contemporary in approximate stages of development—a thing unknown before; but art paid back its long-standing debt to literature, and became in turn a source of inspiration. Poets begin to deal in detailed description; they paint minutiae instead of boldly sketching the old clear outlines. They begin consciously to seek after highly coloured effects and elaborate decoration, such as they saw daily around. So art and literature, mythology and mythography, act and react upon each other in ever-recurring waves of graceful decadence. How far this tide had ebbed we may best see by placing side by side the cylix in Plate 4 and the painting in Plate 15. The mere juxtaposition is enough; and we thank the Cyclops for living on from age to age to tell us in person a story so strange.

The myth of the Læstrygonians, the cannibals who devoured the men and destroyed the ships of Odysseus, has no great interest in itself. But a series of wall-paintings, attributed to the Augustan age, and discovered on the Esquiline Hill in 1848, give Miss Harrison materials for an interesting chapter. Here, as she says, are "the loathly monsters, depicted in no harsh outlines, but, as if Fate were ironical, with all the soft surroundings of rich

\* *Myths of the Odyssey in Art and Literature*. By J. E. Harrison. London: Rivingtons. 1882.

colouring and dim distance." Fate was not ironical, but classical art inherited romantic data, grotesque and terrible, from old traditions, and never could face the proper ugliness and horror of Scylla and the Cyclops, of Medusa and the Læstrygonians. Scylla's face, as Miss Harrison says, "becomes quiet and peaceful," or has "a wild sensational sort of beauty." And, as we chiefly know ancient art through comparatively late copies, while the taste for beautifying even horrible mythological figures increased as decadence advanced, we can hardly tell how Greek art of the best period would have dealt with the old mythical monsters. Archaic Greek art simply made them foolishly grotesque, like the good-humoured grinning Medusa of the Selinus marbles. To return to the Læstrygonians; the first of the Esquiline pictures (Auto-type i.) shows us conventional cliffs beside the sea. In the background are the galleys of Odysseus; a man in a boat represents the shore, and the fair and tall daughter of the ogre king (why have ogres always pretty daughters?) greets the comrades of Odysseus. In the second picture the ogres are picking up rocks to throw at the ships, and one of them carries off two sailors for dinner. In the background are graceful figures, inscribed NOMAI, pastures personified. The third picture shows, with abundant spirit and very little perspective, the scene in the haven when the Læstrygonians break the ships with rocks, "each of them a man's burden, and anon there rose from the ship an evil din of men dying and ships shattered." The fourth picture is a pretty landscape; the ship of Odysseus is escaping, and, far away, one sees him climbing up the hill in the enchanted isle of Circe.

The other myths are treated with fulness and learning; and there is much interest in the half-human figures metamorphosed by the enchantress of the sweet song and the powerful wand. The figures in plate 21 are particularly interesting. Here the companions of Odysseus are not turned into swine merely, but one wears an ox's head, one is half a horse, one has the head and neck of a swan. The picture is from an early vase, now in Berlin. Landscapes in the house on the Esquiline illustrate the Descent into Hades. A vase (plate 31) shows us the strange shape in which, according to one legend, death came on Odysseus from the sea.

Miss Harrison's work, as we have said, is copious and learned; and, as a rule, she sticks to the matter in hand, and does not wander into digressions. But her contempt for the idea of an all-seeing God need not have been expressed, as it seems to be, in this passage. "Semitic mythology," says Miss Harrison, "through the medium of mediæval tradition, still haunts the dreams of children with visions of a being whose

Piercing eye  
Strikes through the shades of night."

Does Miss Harrison really think that this is the Semitic form of the myths of the Cyclops, or does she suppose that only one eye is attributed to the Deity? In some places Miss Harrison's style is slightly archaic—a result, perhaps, of her very copious use of a recent version of the *Odyssey*. With better illustrations her book would have been a very valuable addition to the literature of ancient art. But probably the author is only responsible for the careful and sensible matter of her own essays. Here is a book that every student of the *Odyssey* will find interesting, and we can scarcely blame her for not giving, what she does not profess to give, some account of the origin and distribution of the myths.

#### WHEELER'S TALES FROM INDIAN HISTORY.\*

WE do not doubt Mr. Wheeler's ability to produce a good book on India; but it is a question if he has done wisely in challenging a comparison with Scott's *Tales of a Grandfather*. We discern nothing in this small volume which recalls to us Scott's careless but animated style, telling us so much about the Border clans and the incorrigible Stuarts. Moreover, too much is attempted in two hundred and seventy pages. An analysis of the *Maha Bharata* and the *Ramayana*; the reigns of three or four great Mohammedan Emperors, with sketches of Mahmud of Ghazni and Mohammed Toghlik; the rise of the Mahrattas; the history of early British settlers, and the policy of Hastings, Cornwallis, and Wellesley—all this cannot be adequately treated on the plan of Lamb's *Tales from Shakespeare*. Then we have political disquisitions about native life and character, the restraints of caste, the prevalence or decay of superstition, the want of public spirit amongst Hindoos, and divers other topics. The subjects are not new; and, while we concur with Mr. Wheeler in thinking that many of the facts adverted to by him are spread over bulky and voluminous publications, we are somewhat at a loss to discover what there is in his book which has "not been published at all."

The style is not wanting in animation, but these chapters must have been dashed off "in the intervals of business." That the outlines of Indian history should be correctly traced without any errors in spelling or misconceptions of phrases, titles, and dignities, is of course what we had a right to expect and what we found. But we also find strange omissions which argue hurry and want of dili-

gence. It is a fallacy to imagine that Indian history can be brought home to the intelligence of Englishmen by light treatment of unfamiliar subjects and by the occasional use of English synonyms. Occasionally there is recourse to padding, and surmises take the place of statements. Here are some examples. In the opening chapter we are told of "a blind Raja" who became the monarch of Hastinapura, some sixty miles from the modern Delhi. All Hindus and many Anglo-Indians know that the name of this unfortunate prince was Dhritarashtra. In like manner, when, by no means for the first time, we are told the story of Sevaji and his celebrated weapon the *waghnaik* or "tiger's claws," the name of the "Mohammedan general" whom the Mahratta robber treacherously assassinated is not given. He was known as Afzul Khan. When an historian writes of the assassination of a statesman he generally tells us whether his name is Cornelius de Witt, or Spencer Perceval, or Abraham Lincoln. Then the private character of the Emperor Akbar is discussed, and we are reminded, correctly enough, that this noblest of Oriental sovereigns was fond of religious discussion, tolerated Christian missionaries, and took to himself, amongst other partners, a Roman Catholic Miriam Bibi, to wife. But here Mr. Wheeler, like the diner-out who wanted to tell a good story, had something to say about Goa, its big ships, huge cannon, convents and churches, and the tomb of St. Xavier. So we are transported at a leap from Agra, Futtahpore, and the Emperor's tomb at Secundra, to the west coast of India, and are asked to imagine that "possibly Miriam was a Portuguese maiden educated at Goa"; and that "possibly she may have been an instrument in the hands of the Christian fathers from Goa and a fellow-labourer in the work of conversion." True history is not written on a vague hypothesis of this kind, which might have supplied the late Meadows Taylor with suitable material for his clever *Oriental Tales*. Olive died at the early age of forty-nine, as Macaulay's readers know; but why does Mr. Wheeler omit the fact that he died by his own hand? At page 143 the full effect of the defeat of the Mahrattas by the Afghans in the battle of Paniput in 1761 is hardly given. Mr. Wheeler says that Ahmed Shah's success paralyzed the Mahratta rulers, and that nothing was heard but weeping and wailing throughout the Mahratta country. What the victory of Paniput did was to check the rise of the great houses of Gwalior, Nagpore, and Indore for more than thirty years, till the British Government, under one Wellesley in the Council and another in the field, was able to cope with them and with Tipoo Sultan. At page 101, a most tremendous subject—that of the Oriental right to real or immovable property—is disposed of by the curt remark that "all the lands of the Empire belonged to the Padishah," that is, to the Emperor of Delhi. We have not space for an outline of the opposite view, and can only assert that it can be argued from Hindu and Mohammedan records as well as our own that the land was the property of the man who cleared and cultivated it, and belonged neither to Raja nor to Tulookdar. It was, no doubt, always burdened with rent and revenue. Indeed, Mr. Wheeler himself further on recognizes this, and admits that Ryots are often "hereditary proprietors or joint proprietors of the village lands, subject only to the payment of rent." "As far back as 1833 the trade monopoly," so we are informed, "of the East India Company was abolished." We must go back just twenty years further, or to 1813. In this year the East Indian trade was thrown open. The exclusive trade with China remained, and was only abolished in 1833, at which date those extremely snug and comfortable appointments known as "China Writerships" ceased to be bestowed on the sons and nephews of Directors of the old Company. The following sentence may perplex a good many civilians, missionaries, and other Englishmen who have mixed as much as was possible in native society. "The Hindus, as a rule, only marry one wife, and no respectable man, excepting a Raja, will follow the example of the Mohammedans in taking more than one partner." The evils of polygamy, especially amongst the Kulin Brahmins of Bengal, who are not generally Rajas, have been the theme of reformers for the last thirty and forty years. Many sexagenarian Brahmins, within a few miles of Government House Calcutta, have each taken more than a dozen wives. Instances are quoted where old dotards, almost ready for cremation at Neemtolla Ghaut, have taken a child-wife for their hundredth partner, and every official knows cases of a Sateen, or second wife, in the household of a strict and orthodox Hindu. We should be glad to believe that Kulin polygamy was "dying out," but the real reason against polygamy has been that it is an expensive luxury. An ordinary Hindu artisan, tenant proprietor, merchant, or official cannot afford to maintain more than one wife. In the account of Hastings and Impey, Mr. Wheeler too easily repeats the cry that forgery had never been treated as a capital offence in India. This is incorrect. The late Sir John Kaye, in the *Calcutta Review*, proved conclusively that persons had been formally condemned to death for this very offence, but respited by the "Mayor's Court," which preceded the old Supreme Court of Impey, Hyde, and Lemaistre. In an age which witnessed the execution of Dr. Dodd for forgery, there is nothing so very shocking in the capital sentence passed on Nundo Kumar. The record of his trial, we must inform Mr. Wheeler, was certainly extant a few years ago. It lasted more than two days. The accused was defended by able counsel. His original offence was backed up on his trial by perjury, and the blameless Sir Robert Chambers, the friend of Johnson, Gibbon, and Burke, was one of the full bench that rejected a legal plea in bar of punishment, on full deliberation, after sentence had been pronounced.

\* *Tales from Indian History; being the Annals of India retold in Narratives*. Complete in 1 vol. By J. Talboys Wheeler, late Assistant-Secretary to the Government of India in the Foreign Department, late Secretary to the Government of British Burma. London: Thacker & Co. Calcutta: Thacker, Spink, & Co. Bombay: Thacker & Co., Limited. 1881.

Some of Mr. Wheeler's expressions are more fitted for an electioneering speech, or for the occasional and flashy notes of a second-class weekly journal, than for a history intended to "be interesting as well as instructive." The English exported salt-petre, and drove "a roaring trade" during the Civil War. "The present of a hundred thousand pounds must have *bothered* Warren Hastings." In the account of the Indian Mutiny we come on a sentence which would puzzle Sir John Kaye, Colonel Malleson, or any other writer who has described that great crisis. "The greased cartridges at Calcutta had created a mutiny at Barrackpore, but the incapacity of the military authorities at Meerut had turned the mutiny with a revolt at Delhi." The meaning is hardly made clearer by charitably supposing that "with a revolt" is a misprint for "into a revolt." We might argue that a mutiny is the greater of the two and that these substantives should change places, but even this is questionable. Of Muttra we learn that its "gilded domes" can be seen from Agra. The former place, associated with Hindu piety and trading, is just thirty-four miles from the ancient capital of Akbar. The intervening space is certainly a dead level. But we should like to know the exact authority, surveyor's or engineer's, on which it is said that the buildings of one place can be discerned from the other. These may be venial and accidental slips, but what are we to make of the following? At the Imperial assemblage at Delhi, where Her Majesty was proclaimed Empress of India, the camps were "pitched by a curious coincidence on the site occupied by the British army during the siege." In what does the curiousness of the coincidence consist? There was no room for the Viceregal assemblage inside the walls of the town, and the most natural and simple thing was to pitch the camp near the Ridge, Hindu Rao's house, and all the other places with which 1857 has made us so familiar. A good deal of bad and of good writing has been expended by others on the Taj Mahal. Mr. Wheeler describes this mausoleum very fairly and in temperate language, but adds that the "silence of death hangs over all" and that the "soul is gone." We should like to know the burrow, cairn, Mole of Adrian, or tomb of Cecilia Metella or other burial-place of which the same might not be said. Tombs are usually silent places unless profaned by vulgar sight-seers, and souls, by a law of their own, generally do leave bodies to moulder in such spots. In some of the concluding chapters about Afghanistan and our Eastern policy, the narrative descends to the level of an almanac or a Court Journal, and we are told in a note that the arrangements for the Imperial assemblage at Delhi were carried out under the direction of a gentleman who was then Private Secretary to Lord Lytton, and is now the Political Secretary at the India Office. Mr. Wheeler should have proceeded to tell us who were the caterers for this vast assemblage. Were Englishmen fed for a week or so at so much per head by Messrs Spiers and Pond, or by Mr. Kollner, who monopolises the refreshment rooms at Indian railway stations, or by the Great Eastern Hotel at Calcutta set up by the late well-known Mr. D. Wilson?

We must join issue with the author when he maintains that details about the registers of property in villages, the ownership in land, and the payment of yearly rents are of "small interest." Most administrators would tell him, on the contrary, that they are of the utmost value and interest, and that on them, properly arranged and interpreted, rest the very foundations of Oriental society and the loyal acquiescence of the agricultural community in any rule or Government whatsoever. Again, if Mr. Wheeler's dictum is correct, that "the history of the people of India, apart from religious developments, would lie in a nutshell," why are so many pamphlets, Blue-books, and articles written on the subject? This sort of hasty and off-hand generalization, like the merriment of parsons to Dr. Johnson, is "mighty offensive." A sentence more pithy and to the point is the following:—"The virtues of the Hindus are more domestic than political." That they are charitable, and even lavish; that, except in times of famine, they get on capitally without any poor law; that they deem it a moral obligation to pay the debts of their fathers, to support relatives and dependents, and to advance them in active life; and that they are capable of deep affection and lasting gratitude, is perfectly true. But of public and political morality they are often wholly destitute; and hence the unfavourable opinion formed of them by civil and military administrators and diplomats who have had to make their treaties and propound their laws. Like many others who have known India since the Mutiny, Mr. Wheeler is not without justifiable hope for an Indian future. But his last sentence has surely an odd ring about it. He finds fault with the custom of early marriages, and hopes that "generations yet unborn will be married at suitable ages." But how does the reader imagine that this desirable end is to be attained? Only by connecting India and England by rail, whereupon all native gentlemen are to send their sons to be educated at an English University, and representatives from India are to have seats "in one or other of the national assemblies at Westminster." There is a perfect craze in some minds for forcing on "representation" all over the world, but it is not easy to see why young Hindu girls should cease to be married at the age of eleven or twelve, even if Ram Dhan Mukarji from Bengal, or Gungadhar Shastri from the Southern Mahratta country, were to be pitchforked into the House of Lords.

We should have been glad to notice this work more favourably. Mr. Wheeler possesses industry, considerable literary talent, and valuable experience gained in the Indian Secretariat

and in the educational departments. We are confident that he can produce something much better than a series of disjointed sketches which demand sharp criticism, and suggest comparisons with other writers who have ably treated the leading events of battles and sieges, or have shown a more profound insight into native life and character.

#### HILDA DESMOND.\*

*HILDA DESMOND* is in many respects a remarkable novel, and says much for the ambition of the author. It is didactic, reflective, philosophic, and religious; while it abounds in surprising and startling incidents which prove that ingenious romance may be stranger than any reality. We may describe the story as written in the interrogative and ejaculatory style, and the printers must have been sorely put to it to provide the requisite type. The notice of each event is followed by a series of questions or exclamations, like the running commentary of the chorus in the Greek drama. "Ah! could they have foreseen!" "What will be the end of it all?" and so on. But, in an intricate narrative, decidedly overcrowded with episodes and characters, it is by glancing at some of the matter that we may best convey an idea of the book. The curtain rises on the grounds of a "farmer's" residence in Lincolnshire. But the farmer is a man of fortune, being the son of a successful Australian settler. In fact, he can allow his eldest daughter a couple of hundred per annum for pin-money, and yet the young lady is always in difficulties, which he freely relieves by supplementary cheques. The farmhouse was "a large handsome building in the Gothic style, but with all modern improvements." It was "called 'the Acacias,' probably from the quantity of those lovely trees which grew there," which reminds us of one of the couplets in Mr. Gilbert's *Lab Ballads*. "They called him Peter, I suppose, for Peter was his name." Whether the farmer's wealth had anything to do with it, we know not; but the graceful floral decorations of his abode set the seasons and the laws of nature at defiance. The red and white roses of midsummer flourished simultaneously with the clusters of vernal primroses which "gave the air a delightful fragrance." Alas!—if we may borrow the author's style—that the baser passions of our nature should have grown in rank luxuriance in that balmy atmosphere! The Carlises had everything the heart of man could desire; they had "conservatories, servants, handsomely furnished rooms." "Yet, with all this, there was something wanting. They never gave a thought to the Giver of all that wealth." "If they had been blessed with grateful hearts, how much happier they would have been, even though living in a humble garret." "Could they have even faintly foreshadowed their sad future, how differently they might have behaved! Had such been the case, my story would never have been written." We need not observe that we should have been exceedingly sorry to have lost the story, but we must say that the author seems to be rather hard upon the Carlises. It is true that the father proved a sad scoundrel, though he ended infinitely better than he deserved. And the beautiful Helen, the eldest daughter, who had dresses forwarded from Worth of Paris to the Lincolnshire farmhouse, had the heart of a fiend with the simplicity of a baby. But although the rest of the family may have been heedless in times of prosperity, they were transformed with the first cold douche of misfortune. The girls turned out remarkably well—one of them became an absolute angel of mercy and goodness; while the only son was destined to illustrate in perfection the qualities that make one of nature's noblemen.

We shall refer afterwards to his success in life; in the meantime we must return to the less pleasing subject of his father. Mr. Carlisle is somewhat oddly regarded as a tyrant by his children, while he appears to us to be foolishly gratifying their caprices. He reluctantly buys a horse for his son, which he believes to be vicious, and which the lad does not want, and because he slams the door on leaving the room his daughter observes that he is in a terrible temper. He is evidently worried and out of sorts next day; yet, though she asks him for more money most unseasonably, he hands her over 30*l.* with a playful observation on "Miss Extravagance." That may have been weak, but it is creditable to the kindness of his heart, for at the moment he is in painfully embarrassed circumstances. For an Australian capitalist and a respectable elderly man, he had recourse to the strangest expedients to avert impending ruin. We rather fancy that the author has got somewhat confused here over the escapades of the traditional scapegraces of fiction. Be that as it may, Mr. Carlisle goes to a neighbouring race-meeting, where he unluckily finds such opportunities of "plunging" as are rarely to be met with in the provinces. It strikes us that the author is a little "mixed" over flat-racing and steeplechasing, for she describes the second favourite as a splendid fencer; but we have a very spirited account of the grand event of the day, though not altogether in the style of sporting correspondents. We hear how the clever rider of Red Lily did "loosen his horse (sic) to her full will, and the noble animal swept on, till the hoofs seemed never to touch the earth over which they skimmed." With the powers of a Pegasus, naturally Red Lily left Flory Boss nowhere; and it was on the latter that the unfortunate Mr. Carlisle had staked far more than he could afford. *Fred's*

\* *Hilda Desmond; or, Riches and Poverty*. By Nellie Matson. London: Allen & Co. 1881.

*Aporn.* From horse-racing the harassed gentleman farmer passes to card-playing. We find him next in the Paris bells, and puzzled, like the author, over the mysteries of baccarat, which we had taken to be one of the simplest games in the world, but which he apparently confuses with chicken-hazard. Then he betakes himself to drink, and, as we need not add, it is all over with him—for the time at least. The sumptuous fittings of the "Acacias" are brought to the hammer—"the handsome walnut suite"; "splendid pictures, that were in themselves quite a fortune"; "barometers, centre-tables"; "the splendid silver, some hundreds of years old," are all disposed of without reserve. Having devoured the jewelry saved from the wreck, and drank the last fragments of his jotsam and jettam, Mr. Carlisle, who has never left his old neighbourhood, casts about for a situation. He applies to his former friend, Squire Denton, "whose house he had often visited as an honoured guest." Squire Denton, "who was a kind, noble man," but apparently not especially open-handed, offers him the post of head gamekeeper, at thirty shillings a week. "How pleased his wife was when she heard it!" She could now have a pound a week for the housekeeping, leaving her husband a third of his wages for the pothouse. Unhappily he does not keep the situation long. He takes to stealing the Squire's game; next he actually heads a gang of poachers making a raid on the coverts placed in his charge; owes his escape to the generosity of the noble squire; and, though penniless, manages to pay the passage to Australia. We meet him again in hospital at Delhi, having enlisted, gone to India, and been knocked over in the Mutiny, and all apparently by electricity, considering the shortness of the time. At Delhi it is an old acquaintance who discovers the rascal, and gets him forthwith gazetted to a civil appointment in the service of the Crown (!), in which, although his family have utterly lost sight of him, he succeeds in attaining to "high honour and fame."

As the scoundrelly parent ended so satisfactorily, it would have been hard indeed had the career of the son he ruined proved a failure. And some of the stirring scenes in the life of Frank are as good as anything in the novel. Thanks to the intervention of a friend, he is received as a clerk in a London banking-house. The idea of the City establishment appears to have been roughly sketched after some easy-going private firm in a country town. Messrs. Dodd and Johnson are sole partners. After a few months or weeks, they take to loving their new understrapper as "a child of their own." Nor is the copartnership affection chilled by a most untoward occurrence. On one unfortunate occasion all the clerks happen to quit the business room simultaneously for a moment, with the exception of an enemy of Frank's. Strangely enough, however, the cashier has left a bundle of notes on the counter. A sum of money is mysteriously abstracted. The loss is not discovered for a couple of days, which shows that with Messrs. Dodd and Johnson the system of checking accounts was irregular. Nor did they then hold the cashier responsible, but addressed themselves to the body of clerks in general. The clerks assented to the general proposition that the missing money must be found; as it was certain, indeed, that if there were a thief among them he must have placed his booty in security long ago. The solemn wiseheads of the firm went on to suggest that all the gentlemen present should have their "boxes" searched. The gentlemen eagerly welcomed this honourable ordeal, and the partners and police made the round of their lodgings. Then we have a dramatic series of situations, though they rather suggest maids-of-all-work and missing tea-spoons. The climax is of course arrived at when the money is discovered in Mr. Carlisle's "box." Dodd and Johnson, though sadly grieved, play a pair of Brutuses with this child of their own. They tell him that they are fully persuaded of his innocence, but at the same time must send the case to the sessions. Should the law acquit him, so much the better. At the same time they venture to assure him, with a confidence that does honour to their ingenuousness, that the trial shall have no sort of publicity. The trial comes off in two days; we are not told that reporters were excluded. The foreman of the jury is just going to give his verdict on the clearest possible evidence when an agitated woman bursts into court. She tells how a vile plot had been concocted. The prisoner is pronounced innocent amid shouts of applause, and steps out of the box. The actual culprit and infamous puller of the wires chances to be in court. He turns pale and trembles, and with good reason. Who shall say that English criminal proceedings are slow? Waters is thrust straightway into the box that Carlisle has vacated, and sentenced off-hand to imprisonment and hard labour. The firm "mark their respect" for Frank—presumably because he did not steal the money—by advancing his salary from 60*l.* to 100*l.* Shortly afterwards we hear of him as cashier, with the very moderate remuneration of 200*l.*, but finally, when the senior partner dies, he bequeaths his lucrative position to the adopted child of his affections. We should have been glad to have traced the fortunes of Frank's sisters and of the heroine, whom we happen to have forgotten. But after what we have said, we feel it to be superfluous. We must by this time have given a fair notion of the novel; nor do we think we have done the author any injustice, since we have justified our criticisms by quotations. At all events, we believe we may assure our readers that they will find the novel amusing, if it fails to interest.

## ZELLER'S HISTORY OF GREEK PHILOSOPHY.\*

THERE is a general impression in England that, although German writers of the second rank are usually very learned, they are incapable of expressing their thoughts in a clear and attractive style. At the time when German literature began to be seriously studied by Englishmen there was some excuse for this notion, but it is now altogether without ground. German writers of the last generation addressed themselves in the main to specialists, who, if the matter of a book was sound, cared little for the form in which it was embodied. Many of them now seek to reach a wider public, and are therefore obliged to pay more attention than their predecessors to the laws of expression. Professor Zeller is an excellent representative of this new tendency, his manner of writing, although not without occasional difficulties, having generally in a high degree the qualities of order, measure, and precision. At the same time, his learning, in his own department, is as extensive and thorough as that of the scholars who gave Germany her reputation for profound research; and there are few living writers who possess so remarkable a capacity for penetrating to the essential meaning of the ideas of past ages. In interpreting ancient philosophy a modern thinker cannot, of course, wholly escape from the influence of later speculation; but Zeller makes, perhaps, as near an approach to the position of a perfectly disinterested historian as it is possible to conceive. From beginning to end of his great work he strives to look at the world from a Greek point of view; and the effort is supported by an imagination so keen and a judgment so sane and vigorous that, except in matters of detail, his exposition is not likely to be improved by later investigators. Fortunately for English readers, he has found translators who have shown themselves capable of fully appreciating the importance of his labours. The present volumes are a model of what the rendering of such a book ought to be, the translation being strictly accurate, yet without any of those pedantic phrases which, in most books done into English from German, so often remind us that we are not reading a work written originally in our own language.

In the volumes previously translated the writer dealt with particular periods of Greek philosophy; here he sets forth not only the speculations of a particular period, but the principles which govern his work in its whole extent. And it would be difficult to point to anything in recent philosophic literature which is marked by more comprehensive knowledge, truer insight, and greater moderation of spirit than these introductory chapters. He naturally begins with the question as to the method in which such an investigation ought to be conducted. Hegel's theory was that the historical sequence of philosophical systems necessarily accords with the logical sequence of the categories of pure thought. Hence his doctrine affords ample scope for what Zeller calls "*a priori* construction." This view found many supporters in Germany when the Hegelian system was predominant; but, as numerous critics have shown, it has the disadvantage of not being in harmony with facts. Philosophy has dealt with other problems besides those connected with the categories of pure thought; and while in logical sequence we advance from abstract to concrete conceptions, in historical sequence development is invariably in the opposite direction. Besides, the growth of thought has not always been strictly logical. It is easy to see that thinkers of this or that epoch ought to have drawn certain conclusions from certain premises; but it does not follow that the opinion which commends itself to us was that which commended itself to them. They may have been influenced by peculiarities of individual temperament, by the special circumstances of their time, or by scientific and religious prepossessions, to which we have lost the key. An historian of philosophy, therefore, whose aim is not merely to illustrate a system of his own, has no alternative but to accept facts as he finds them; but his history need not on that account be a record of isolated opinions. One of the most valuable conclusions of modern thought is that no class of phenomena is exempt from law; and a definite order may be detected in the evolution of philosophic speculation as certainly as in that of organic forms, although it does not happen to be the order which Hegel attempted to establish. The doctrines of every important thinker and group of thinkers have some reference to a central principle, and each group has necessary relations to those which have gone before and to those which have come after it. As Zeller never loses sight of these fundamental ideas, there is as striking a unity in his presentation of Greek philosophy as in that offered by Hegel; and it is a unity which is not imposed arbitrarily, but which springs naturally from the study of the facts themselves.

It is difficult to sum up the general character of Greek philosophy; but Zeller is justified in maintaining that all Greek philosophers have an unmistakable family likeness. The distinguishing quality of mediæval philosophy was the completeness with which in thought it severed spirit from matter. The two essences were conceived not only as different, but as hostile; and it was supposed that the highest duty of spirit was to conquer material impulse and to live its own independent life. The most logical mediæval thinkers were those who, like St. Bernard, looked with suspicion even upon sacred art as an element which tended to withdraw the spirit from its proper sphere. Modern philosophy started

\* *A History of Greek Philosophy.* Translated from the German of Dr. E. Zeller, with the Author's sanction, by S. F. Alleyne. Vols. I. and II. London: Longmans & Co. 1881.

from this distinction, and, while maintaining it in a certain sense, has persistently sought for a common ground by which the two orders of phenomena may be essentially reconciled. Greek philosophy originated in an assumption of an exactly opposite character. In the earliest records of Greek thought and imagination there is no trace of a violent rupture between the mind and the external world. It is admitted that sense must be controlled by reason; but in themselves the claims of sense are held to be as lawful as those of any other part of our nature. A noble mind is believed to find a suitable manifestation only in beautiful forms; and the highest Greek art does not attempt to give expression to ideas which demand any other kind of embodiment. Form and matter are in absolute balance, and to modify one would be to injure both. The same unity of conception characterizes the earliest efforts of Greek philosophy, which argues from the physical to the intellectual world, and from the intellectual world to the physical, as if they were subject to identical laws. By and by a dualism of thought begins to manifest itself. Plato opposes to the fleeting illusions of sense the permanent realm of ideas; and Aristotle distinguishes the essential qualities of things from the matter in which they are represented. To the Stoics the true aim of life is to become indifferent to the evils which are regarded as inseparable from physical existence; and in Neo-Platonism spiritualism becomes so abstract as to have a close affinity to mediæval sentiment. Yet, even in its latest developments Greek philosophy has a constant tendency to return to its primitive conception. Notwithstanding its illusory character, the external world still seemed to Plato to be divine; and he did not sharply discriminate the various elements of human life—science, morality, and religion shaded into one another by imperceptible gradations. Aristotle attributed to matter an innate impulse towards the abiding forms from which it was ideally distinguished; and the secret of ethical philosophy he found in the harmonious development of our natural activities. The Stoics saw in the order of nature the only rule to which man must conform; and even the Neo-Platonists brought matter into intimate relation to mind by regarding the former as a power which had sprung from the degradation of the latter. This sense of the unity of all being is one of the chief sources of the charm of Greek philosophy; but Zeller has no difficulty in indicating that it was also one of the principal causes of its weakness. It prevented Greek philosophers from seeing the necessity of accurately determining the subjective conditions of knowledge. They were thus unable to obtain any secure test of what is trustworthy in acts of perception and reasoning, and the ultimate transition of the Western mind to other modes of thought was rendered inevitable.

Several admirable sections are devoted to the question how far Greek philosophy should be considered an original product. It has often been maintained that its leading ideas were derived from Oriental systems; but no importance can be attached to the ancient authorities appealed to in support of this position. A more formidable argument is obtained by reference to the resemblances which exist between Greek and Oriental doctrines. These resemblances have been elaborately set forth by Gladisch, who contends that the philosophy of Pythagoras is to be attributed to the Chinese, that of the Eleatics to the Hindoos, that of Heraclitus to the Persians, that of Empedocles to the Egyptians, and that of Anaxagoras to the Jews. There is, however, no known way by which ideas could have passed directly from the East to Greece. The Greeks were indifferent to every language but their own, and interpreters were not likely to be versed in philosophy. The ideas of the earliest Greek philosophers are of so simple a character that it is unnecessary to trace them to a foreign origin, and of the later systems it can be shown how one gave way to another by a necessary process of evolution. Some of the similarities pointed out by Gladisch are certainly remarkable; but we ought not, perhaps, to be surprised that the same conceptions frequently suggest themselves to races which are at a corresponding stage of culture, even if their external circumstances are widely different. On the whole, the evidence seems to leave no doubt that the philosophy of the Greeks originated among themselves, and that its development was due almost exclusively to the free exercise of their own powers. It was inevitable that a people endowed with so bright and penetrating an intelligence should endeavour sooner or later to form a coherent theory of the world, and many conditions of their social life were eminently favourable to the growth of philosophic theory. Among these a high place must be given to their religion, the most characteristic of all the manifestations of their national genius. It used to be thought that the mysteries had exercised an important influence on philosophy, but this conjecture must now be abandoned, since it is almost certain that the mysteries were originally ritualistic ceremonies, and that they were ultimately modified by philosophy to a much larger extent than philosophy was ever modified by them. The only doctrine which appears to have passed from the mysteries to philosophy was that of metempsychosis, which may have been at one time the property of the whole Aryan family; but this doctrine did not form a vital part of any Greek system. To the general character of Greek religion, however, the philosophers were deeply indebted. The gods themselves were conceived of as a part of nature, and there was nothing in their service that introduced into the moral life of the people an element of strife and disquiet. Moreover, the priests held a subordinate place, and the absence of a definite creed enabled thinkers to pursue their speculations without much dread of consequences. Anything that seemed likely to affect public worship injuriously

was sternly dealt with, but there was no particular reason for interfering with the progress of abstract thought. In illustrating these positions Zeller displays a perfect mastery of his subject; and he is not less successful in marking the effect produced by civil and political institutions, by cosmology, and by theology and anthropology in their relation to ethics.

Many divisions of Greek philosophy have been suggested, but Zeller properly contents himself with the division that appears on the surface, making the first period end with the Sophists, the second with Aristotle, and the third with the Neo-Platonists. It is the first period that he specially investigates in these volumes. This period opened with the Ionic school, and passed on through the Pythagoreans to the Eleatics. In the labours of these schools the aim of philosophy was to determine the ultimate substance of the universe, and the Ionians identified it with various kinds of matter, the Pythagoreans with number, the Eleatics with Being. Heraclitus found the primitive essence in fire, being led to this conclusion by observing that all things are in a continual state of flux or change. After Heraclitus the problem of philosophy during the first period was to explain the incessant process of "becoming" on which he had fixed attention. Empedocles accounted for it by assuming the existence of four elements and two moving forces, Leucippus and Democritus by their theory of the atoms and the void, Anaxagoras by the doctrine of a world-intelligence. Philosophy could not advance further without reference to the laws of cognition; and for the introduction of a new principle the way was prepared by the Sophists, who denied the possibility of objective knowledge. Zeller omits nothing that is necessary for the comprehension of these philosophic movements, in so far as they can be understood from existing sources of information. He generally confines himself in the text to the statement of his own views, but in the notes he discusses every important opinion with which he does not agree; and it is something to say of a German controversialist that, although he has many antagonists, he does not mar his replies to them by a single harsh or unfair word.

DAVID COX.\*

IN an editor's preface to the *Biography of David Cox*, Mr. Bunce sets forth the special qualifications which the biographer had for the task he set himself. He was for a long time the intimate friend of Cox, and "was himself an artist of long experience and of no mean capacity," although he was, it seems, more occupied and better known as an adviser of picture-buyers. It was among his merits that "long before the picture-buying public recognized the surpassing merit of Cox's work, Mr. Hall discerned it, and laboured hard to inspire others with the feeling of enthusiasm which animated himself." This enthusiasm is evident enough in the pages of the biography, and if it sometimes misled Mr. Hall into recording trivialities which would have been better left alone, yet it is by no means without its use and attraction. We live in an age of biographies, many of which are superfluous enough, and it is pleasant to come upon one which deals, on the whole in an interesting way, with so interesting a man as David Cox.

The subject of Mr. Hall's book was born, in 1783, in Birmingham. His father's occupation was that of a whitesmith—"in contradistinction," Mr. Hall quaintly wrote, "from that of a blacksmith"—and it was intended that David Cox should follow his father's trade. But in early youth he broke his leg, as the result of a tumble over a door-scraper, "and this caused the poor little cripple to divert his thoughts into another channel." While kept to his bed he took to copying prints, in which he showed facility, and was soon afterwards presented with a box of colours and some brushes, with which, as we are told, he made little pictures, which were sold for trifling sums among his friends. It was then determined that he should receive a few drawing lessons at a night school kept by Mr. Joseph Barber, of Birmingham, "a competent drawing master and artist. . . . With the exception of two or three lessons in after years from that admirable master of water-colours, Mr. John Varley, the instruction David Cox received in drawing whilst at this night school of Mr. Barber's was all that he had. For the rest he was indebted solely to himself—to the gifts with which he was endowed by nature; to the study of the works of masters of the art which came in his way; to a close, intelligent observation of the beauties of nature; to constant practice, and to a stout heart." This passage seems particularly worth notice, inasmuch as, while on the one hand it is from these facts all the more remarkable that Cox should have done so much as he did; on the other they fully account for the faults of execution which clung to him and to which Mr. Hall was pardonably blind, and which indeed in some passages of his work he spoke of as absolute merits. It may here be added that, when such allowance as is necessary in this direction has been made, the chapter devoted by Mr. Hall to Cox's characteristics and distinguishing merits as a painter is full of fine appreciation and insight.

Like some other distinguished artists, Cox in his early days was a scene-painter. On the death of the miniature-painter in Birmingham to whom he had been apprenticed he accepted an engagement in the Birmingham Theatre, then managed by the

\* *A Biography of David Cox; with Remarks on his Works and Genius.* By William Hall. Edited, with Additions, by John Thackeray Bunce. London, Paris, and New York: Cassell, Pottet, Galpin, & Co.

older Macready, as assistant to M. de Maria, scene-painter to the company. The engagement gave him an opportunity of pretty constantly watching the method of De Maria, of whom he always spoke with respect. Mr. Hall has a pleasant story of their meeting in later days:—

Many years after Cox had left the theatre, when he had become a member of the Society of Painters in Water-Colours, and an exhibitor in their rooms, he was one day strolling through the gallery, the exhibition being then open, when he saw an elderly gentleman, catalogue in hand, looking admiringly at one of his drawings. Cox recognized in the visitor his old master at the Birmingham Theatre, De Maria, and addressed him by name, but was evidently forgotten. Cox inquired if he did not remember "one David Cox, a very young artist, who resided in Birmingham many years ago?" "What! little David who used to wash brushes and spread colours for me at the theatre?" "Yes, I am little David." "Did you make that drawing?" pointing to the one he had been admiring. "I did," said Cox; "I learned a great deal from you, sir." "Then I have a great deal to learn from you, now!" rejoined the old man; and both master and pupil were well satisfied.

After a time Cox succeeded to De Maria's position at the theatre, but threw it up at his parents' request, and after a short stay in Birmingham came up to London in 1804 in the hope of getting employment at Astley's Circus. Here there is a slight inconsistency, which is unexplained, since his reason for leaving Macready's theatre was the fear of his parents "that his moral character might suffer from his connexion with the players." However, he did not obtain the post at Astley's, and "resumed his old occupation of making drawings, which he offered to the London print-sellers. . . . Two guineas per dozen was his regular charge for subjects in Indian ink or sepia, which were disposed of by the dealers to country drawing masters chiefly, who visited London twice a year to purchase 'copies' for the use of their pupils." Prout was at the same time engaged in the same way, and the two made arrangements to avoid their coming into collision at the same shop. It was while he was making a precarious living in this way, and by occasionally painting scenery for the provincial theatres, that Cox married and took a small cottage near Dulwich, where he lived for several years, and where he took up teaching drawing as a profession, one of his earliest patrons and pupils being Colonel Windsor, afterwards Earl of Plymouth. From Dulwich he went for a time as drawing master to the military college at Farnham, and from Farnham back to London, where, "after the lapse of about a year, Cox began to look about for some source of permanent income, for the mere sale of drawings was insufficient." This he found in the situation of drawing master to a girls' school at Hereford, whither he went in 1814. Here he found himself able to take other engagements as drawing master to schools, as well as to give lessons to private pupils. "In this way he toiled on for a long time, often heart-sick and weary of his task, but he was slowly making a little money and feeling his way to a more prosperous condition." This, it may be assumed, he had attained to his satisfaction by the time that he left Hereford in 1827, after selling his cottage for a good price to a West Indian planter. "In the settlement there were a few shillings to be returned to the planter from the sum paid down. Cox searched his pockets to find the necessary coin, when the new owner exclaimed, 'Never mind the change, Mr. Cox! you can give me five or six of your little drawings for the balance!' 'And he really meant what he said!' Cox told his friends when narrating the story." A curious comment on it is afforded by the history of the well-known picture "Lancaster Castle," which is given in the following chapter. It was originally given by Cox to an old friend, who some time afterwards happened to be short of money, and meeting Cox, said, "Mr. Cox, I've got a picture of your painting. I am short of money at this time. Should you mind if I sold 'Lancaster Castle'?" Cox replied, "Not at all. Sell it to me. If you remember I gave it to you." In the end Cox bought the picture for twenty pounds, and re-sold it for the same price. At the Gillott Sale it went for something like three thousand guineas.

In 1841 Cox moved from London to Harborne, where he lived until his death in 1859. The record of his life here, if it has not the same kind of interest that attaches to the history of his early struggles, is yet full of pleasant touches both of event and character, and there are some attractive chapters devoted to his many visits to Bettws-y-Coed, a place which he may fairly be said to have invented. The lawsuit which lately took place about the signboard which he painted for his favourite inn, the "Royal Oak," will be fresh in the recollection of readers.

Mr. Hall's personal reminiscences of Cox are particularly pleasing, and his description and estimate of the painter's character carry with them the conviction of truth. As we have said, there are some excellent passages in the critical part of Mr. Hall's work, and one of his more general observations seems to us particularly good. "David Cox," he wrote, "was eminently a truthful painter. He saw nature as it really appears to a healthy unsophisticated mind. Not many artists are so highly favoured." He goes on to give a particular illustration of what he means. "An artist shall be born with what is termed a 'grey eye.' When he looks at nature he sees little but what is grey to him." Consequently a cool or a cold grey tone prevails in all his attempts to reproduce nature. "Critics conclude hastily that he does not represent what he sees. The probability is he does see what he represents, but that he does not see all, and that we do not see as he does." Then there is the converse case of the artist with an "eye for colour," who "applies all the resources of his palette to produce a representation of the effects of colour displayed before him; and from this excess

he not improbably fails in truthfulness." This seems to us well considered and well put, although for argumentative purposes it is open to a fatal objection. Since it may be that no two persons see nature alike, how is a satisfactory decision ever to be arrived at as to the claims of rival painters? and how, if called on for proof, could Mr. Hall have supported his assertion that Cox combined the two qualities he has touched on? His answer would come at best to saying, "It seems to me, and it seems to some others, that Cox saw nature truly and reproduced it truly." But, however this may be, we leave the biography with a feeling of pleasure that is not too often associated with the task of reviewing.

#### TALBOT'S ENCHIRIDION OF EPICTETUS.\*

SOME months ago (*Saturday Review*, January 1, 1881) we had occasion to speak in rather uncomplimentary terms of Mr. Talbot's *Greece and the Greeks*. We regret that we cannot make amends by praising the present work. It is true that his version of the *Enchiridion* does not contain the same mass of mistakes or display such astonishing general ignorance as his previous publication, but the improvement in this respect seems to be due to an increase of caution rather than to any advance in knowledge. Various passages in *Greece and the Greeks* pointed to the conclusion that Mr. Talbot, to put it mildly, had no very accurate knowledge of the Greek, or, for the matter of that, of the Latin language. He has avoided giving further evidence of this unfortunate deficiency by taking care that his "translation" shall have as little as possible to do with the text of his author. His accounts of the most ordinary features of Athenian society were strikingly at variance with well-known facts; but with regard to Epictetus he gives us no information at all, except such as is contained in the very safe statement that he was a Stoic philosopher. The names of Epictetus and Zeno are coupled in a manner which may very well lead a casual reader to suppose that the two philosophers were contemporaries, while nothing is said as to the period and circumstances in which Epictetus lived and taught; and the name of Arrian, who, in fact, compiled the *Enchiridion* from notes of his master's lectures, is not even mentioned. Nor can this reticence be ascribed to a belief that information on the subject would be superfluous, for Mr. Talbot is good enough to favour his readers with scraps of intelligence on the most trite topics. Thus he gives, and gives correctly too, the derivation of the words *Enchiridion* and *Stoic*, and thinks it necessary to sketch in a note the life of Socrates. Here, however, his inveterate habit of blundering is too strong for his new-found caution. He spells incorrectly the names of the philosopher's birthplace and of his dearest friend, and gives the following ludicrous account of the *daimon* of Socrates:—"In consequence of the wonderful development of this" (the reasoning) "faculty, he was supposed by his friends to be always accompanied by a Demon." Why an unusual development of the reasoning faculty should be regarded as a proof of demoniacal possession is not made clear. Of Diogenes we are told that "he was remarkably austere in his manners and mode of life," and that "he lived for the most part in a large vessel which was called his tub." Mr. Talbot has his word to say, too, upon the mutual relations of some of the leading schools of philosophy:—

There was but very little difference between the doctrines of the Socratic and of the Stoic schools. The Academicians, of whom Plato was the founder, differed but little from the Socratic philosophers:—they agreed in the most sublime and essential doctrines, those of the existence of one God, and of the immortality of the Soul. Indeed, there can scarcely be said to be any difference in the moral systems of Socrates and of his pupil, Plato.

This is, indeed, an important aid to the understanding of Greek philosophy. It is interesting, too, to know that "the manners of Pythagoras were mild, gentle, and pleasing."

When Mr. Talbot comes to speak of the manner in which he has "discharged his office of translator," his ecstasy of self-congratulation is altogether too much for his prudence. He commits himself to a series of statements which prove that he has taken no pains whatever to inform himself of what has already been done in the way of commentary upon and translation of the *Enchiridion*. He says in his preface that "the work is now presented to the public in a form entirely new"; and, further on—"This is the first time that the *Enchiridion* has been put into English verse, at all events as far as I am cognizant of the fact." On the face of it, the statement is extremely probable. There are many very good reasons for translating classical poetry into English prose, but none for turning Greek prose into English heroics, unless we accept our author's remarkable plea that "it is equally proper to translate prose into poetry as to compose an original poem out of historical or fictitious records in prose." And so it might very well have been left to Mr. Talbot to experience the fearful joy desired by Lucretius—

Ire jugis qua nulla priorum  
Castalliam molli devertitur orbita clivo.

But, as a matter of fact, several predecessors have left their footprints on the maiden peak to which he aspires. Not to mention French translators, some of whom have chosen the medium of verse, the great discovery has been anticipated by more than

\* *The Enchiridion of Epictetus, and the Golden Verses of Pythagoras*. Translated into English Prose and Verse, with Notes and Scriptural References, together with some Original Poems. By the Hon. Thomas Talbot. London: Sampson Low & Co. 1881.

one English writer. We need only mention one of these, E. Walker, who in 1697 published the *Enchiridion made English in a Poetical Paraphrase*. This version is on exactly the same plan as Mr. Talbot's, and only differs from it in vast superiority of execution, so that Mr. Talbot may be said to stand to Walker in the same relation as Mr. Puff to Shakespeare—"Two people happened to think of the same thing, and Shakespeare," or Walker, "used it first." Mr. Talbot is careful to assure his readers that he has lost no opportunity of attaining to a satisfactory ignorance of his subject. Though he is acquainted with the existence of two translations, he has, as he tells us, only read one, a Latin version; and if his knowledge of the Latin language at large is on a level with his knowledge of Latin prosody, we feel sure that this reading has in no way prevented him from approaching his task with an unbiased mind. He quotes the last line of a well-known passage from the *Ars Poetica*, thus:—

Un le pedem referre pudor vetat, aut operis lex.

"Of course Horace wrote 'proferre.' This false quantity gives rise to the suspicion of a still more painful lapse. Mr. Talbot, in citing what is perhaps the most hackneyed of all the stock quotations from Horace, inverts the order of the first two words, and writes 'nomine mutato de te fabula narratur.' Can it be that he takes this for a hexameter line? The suggestion seems injurious, but the words could not otherwise occur in this order in hexameter verse, and the Latin language has suffered even worse things at Mr. Talbot's hands. In connexion with the subject of quotations, it may be mentioned that in the course of the 'notes' Mr. Talbot is rash enough to quote from the Greek text only in four instances, but these four contain three blunders, any one of which is sufficient to make nonsense of the passage in which it occurs. But Mr. Talbot's second claim to originality of method has yet to be mentioned. It is based upon the fact that he has placed Scriptural references at the bottom of almost every page. 'These references,' he says, with honest pride, 'present a novel aspect in the department of classical literature.' He goes on to say that he has never, so far as he can remember, 'seen a single comparison between an ancient author and the Sacred writings drawn by any translator or commentator of our times.' Such a statement as this implies either remarkable weakness of memory or complete ignorance of the work of modern commentators. If there be any merit in having made more extensive use of Scriptural references than any other translator, it may no doubt be granted to Mr. Talbot, who sometimes borrows Scriptural expressions in his text, and then quotes the original passage in a foot-note as if the similarity of language were a remarkable coincidence, and sometimes cites a long passage of Scripture which has no apparent connexion with the text.

The translation itself is hardly a fit subject for serious criticism. In no true sense of the word can it be said to be translation at all. It might perfectly well have been compiled from an earlier version without any reference whatever to the Greek text, for it is hardly too much to say that in no single passage is the language or style of thought of the original reproduced or even suggested. All that the translator has done is to express in diffuse and often faulty verse a series of moral maxims roughly corresponding to those of his author. But, leaving out of the question those passages which advocate the extreme views of the Stoics on the duty of disregarding external circumstances, the *Enchiridion* simply enjoins a course of action in the various relations of life which has been accepted and preached and practised by moralists of every school and every shade of opinion. It is, therefore, only interesting by reason of its happy terseness of expression, and the pithy brevity of the arguments adduced; and an attempt to apply the style of Pope to a writer who has a great deal in common with Bacon would be worthless even if it were successful. Let us take by way of an example one of the shorter chapters. Epictetus, or rather Arrian, thus expresses the principle of 'fais ce que dois, advienne que pourra':—"Οταν τι, διαγνοῖς ὅτι ποιητέον ἐστί, πείθῃ, μηδέποτε φύγει δόξηαι πράσσειν αὐτό, κἀν ἀλλοῖσιν τι μέλλουσιν οἱ πολλοὶ περὶ αὐτοῦ ὑπολαμβάνειν. εἰ μὲν γὰρ οὐκ ὁρθῶς ποιεῖς, αὐτὸ τὸ ἔργον φύγει. εἰ δὲ ὁρθῶς, τι φοβῇ τοὺς ἐπιπλήζοντας οὐκ ὁρθῶς; Mr. Talbot renders this as follows:—

From righteous acts let nought thy mind dissuade;  
Of vulgar censures be thou ne'er afraid;  
Pursue the task which justice doth decree,  
E'en tho' the crowd think different from thee;  
With righteous works alone thou shouldst proceed,—  
When truth directs, thy labours shall succeed.  
Such be thy aim,—dispel each causeless fear—  
And vain shall prove the rabble's vicious sneer.

This string of platitudes is, unhappily, no unfair example of Mr. Talbot's style. But we are not left to gather the principles of the Stoic philosophy from verse alone. To each chapter is prefixed an "analytical illustration," which is explained in the preface to mean "an analysis of its contents, or, perhaps I should rather say, a prose version of these, adapted, in train of idea and form of expression, to the doctrines and phraseology of Christian philosophers." Here is the "analytical illustration" of the passage quoted above, which only requires the signature of that Christian philosopher, Wilkins Micawber, to be complete:—

Let nothing dissuade you from that which is right; and be not turned aside from the path of honour and justice by the censures and derision of the senseless crowd. Be all your conduct regulated by the dictates of justice and of righteousness; and thus shall your pathway be smoothed with peace and joy, and lighted by the radiations of a tranquil and serene mind. Thus shall your course through this life be marked with success;

and though the rabble's envenomed sneer may sometimes meet your eye, security and success shall be ever in your train, and shall lead you to their haven of safety.

It would be interesting to know how security and success can "lead you into their haven of safety," if they are to "be ever in your train"; but it is a far more serious blunder to make a Stoic philosopher attach any importance to success in life, or hold it out as an incentive to the pursuit of virtue. The central fact of the Stoic teaching, of course, was that such considerations are matters of absolute indifference. It would be absurd to subject to minute criticism such work as this, for the most superficial examination shows it to be utterly slipshod and unscholarly. We may well be surprised at the infatuation which induces one who has so much rudimentary knowledge still to acquire to take upon himself the office of teacher.

It is to be feared that Mr. Talbot will not take much higher rank as an original poet than as a translator. The specimens of verse which fill the concluding portion of the book, have, we gather, been published before—perhaps in the "poet's corner" of some small provincial journal. "An Ode to Queen Victoria on her Coronation" is in reality a sermon to the Irish people, and may perhaps have been written ironically in the course of the last year or so. Dissension is forbidden to stalk over the plain, or to think of the past and its woes; but the construction is here rather confused; at any rate, dissension, or the Irish people, is informed that "thus shall love, union, and harmony reign"—a prophecy which, as we know, has been satisfactorily realized. For the rest, these poems illustrate a profound reflection which Mr. Talbot makes in the course of his notes on Epictetus:—"It is sometimes amusing to trace the similarity not only of idea, but also of expression, which exists between writers both of the same and of different times." Thus we find "A Sigh for the Past" written in the metre of Gray's *Elegy*, and containing both ideas and expressions obviously borrowed from it, though Gray cannot claim the merit of having discovered that "a glance" can "illumine the scene of glory with a sigh." Moore, too, seems to be a favourite poet of Mr. Talbot's, who does him the honour of borrowing his metres and imitating the structure of some of his shorter pieces, with results which remind one forcibly of a certain fable concerning a lapdog and another quadruped. We may quote, as an example of this style, one stanza of a poem relating to a "nymph of the ocean" whom the poet saw, appropriately enough, "on the wild wave of the rolling Atlantic":—

The vision is fled, which (tho' strange it may seem)  
An instant both gave him and bade him resign.  
It passed through his heart like the flash of a dream;  
And he sudden exclaimed, "Oh, she ne'er can be mine."

A notice of Mr. Talbot's work can scarcely be better concluded than by commending to his careful consideration the maxim of his favourite author—"σιωπή τὸ πολὺ ἔστω· ἡ λαλεῖσθαι τὰ ἀναγκαῖα, καὶ δὲ ὀλίγων"—or, as his own version expresses it:—

First learn thy tongue's full freedom to restrain;  
Nor let thy language ever flow in vain.

#### CHURCH SYSTEMS OF ENGLAND IN THE NINETEENTH CENTURY.\*

IT cannot have escaped the notice of any keen observer of the religious phenomena of our time that, whereas the National Church mainly occupies itself with its own business, the self-called "Free Churches" occupy themselves to a surprising degree with the business of the National Church. We do not find that the Church Congress in any given year has ever yet manifested the slightest anxiety for the progress and prosperity of Independency, Anabaptism, or Presbyterianism; but at the annual general gatherings of each of these sects the very greatest anxiety is manifested for the welfare of the National Church, and an edifying eagerness for its deliverance from the patronage and control of the State. The various sects which have been generated out of the Wesleyan germ are either less benevolent or more attentive to their own business than the older sects developed out of the Puritan germ. The Methodists at their gatherings busy themselves exclusively with Methodism, and leave the Church of England alone. When the Committee of the Congregational Union of England and Wales invited Mr. Rogers to deliver the sixth "Congregational Union Lecture," they must have known beforehand exactly what he would give them. Modern Liberationist Independency is totally devoid of originality and even of individuality; the world has long been acquainted with everything that it has to say. Whether it is Mr. Rogers, or Mr. Dale, or Dr. Allon who is its organ, the utterance is always one and the same. Each of these gentlemen seems to be penetrated with the conviction that the world was created in order that the Church of England might be disestablished and disendowed. Mr. Rogers delivered thirteen lectures before the Union. The first eight of these lectures deal wholly or chiefly with the Church of England; one lecture is devoted to the Church and the Sects, or, as Mr. Rogers phrases it, "the Established Church and the Free Churches." Four other "Church systems of England"—Plymouth Brethrenism, Methodism, Presbyterianism, and Congregationalism—only get one lecture apiece, while the hundred other "Church systems of England" get no lecture at all.

Mr. Rogers starts with the assumption, which is now generally

\* *The Church Systems of England in the Nineteenth Century.* By J. Guinness Rogers, B.A. London: Hodder & Stoughton. 1881.

held by Liberationists, that there exists a certain whole called "Anglican Christendom," and that the component parts of this whole are the "several communities" or "Churches." The "Episcopal Church" is only one among the many. Dr. Allon proclaimed the same hypothesis in his address on "Congregationalism" this year from the chair of the Congregational Union. None who have the slightest acquaintance with the works of the fathers of English Independency will need to be told that they would have regarded such a theory with horror. They would have granted that the "Episcopal Church" was one among the many sects; and they held it to be the most anti-Christian and Babylonish, save one, among the many. But Brown and Barrowe held, as strongly as Hooker or Laud did, that there could only be one Church, and they maintained that the component parts of this divine entirety were Congregationalist "Churches." They would have renounced with horror the modern Liberationist hypothesis that the Presbyterian, Anabaptist, Methodist, Quaker, Swedenborgian, and other communities have the least right to the title of "Churches." They would have shown no tolerance for the modern theory of their degenerate sons, that the all-important distinction between the Church of England and an Independent congregation is not that the former is anti-Christian and the latter Christian, but that the former is an "Established Church" and the latter a "Free Church." If they had believed the National Church to be a true Church in any sense whatever, they had sufficient perception of the sin and mischief of schism to have abstained from the foundation of Independency, or, to use their own phraseology, from "gathering Churches." The Church of England, in the view of the religious ancestors of Mr. Rogers, was not a part of Christendom, but a part of Satan's kingdom or the world; it was founded on what they held to be the soul-destroying illusion that God had redeemed the whole nation, and that baptism might consequently be administered to every native. Congregational Independency was originally a protest against the wide liberality and humanity of the Catholic Church, and of the National Church of England as a part of historical Christendom. The early Independents had no quarrel against the State for "establishing" the Church. They protested against the establishment of an anti-Christian system in the place of the true Church system. John Pory, the famous proto-martyr of Independency, in his declaration of allegiance to Queen Elizabeth in 1593, did not quarrel with her establishment of the Church, but with her establishment of a society which was not the true Church. He expressly says:—"Her supreme authority within her realm and dominions I acknowledge to be such over all persons, in all causes, as no person, either civil or ecclesiastical, may exempt himself or his cause from the power and censure of her laws and sword. I do also acknowledge that Her Majesty hath full authority from the Lord, by her royal power to establish and enact all laws, both ecclesiastical and civil, among her subjects; in the making whereof the Lord requireth that her ecclesiastical (laws) be warranted by his written word." The early Independents really demanded that Sovereigns and Parliaments should accept them, instead of accepting the Pope, or the Bishops, or the Presbyterian Puritans, as the authentic interpreters of that written word. The religious forgoers of the Congregational Union and the Liberation Society required that the State—that is to say, the Queen—should establish by law a narrow and intolerant Independency which un-Christianized the mass of the nation and the majority of every parish; they required that she should disestablish the episcopate and priesthood, which were bearing witness to the redemption of the whole nation, and were declaring to every parishioner that he had a right to the sacrament of baptism and incorporation into the Church of Christ. The English people steadily refuse to accept the two new theories of the Liberationists—first, that "Anglican Christendom" is composed of a group of sister churches—the Episcopal, the Presbyterian, the Congregationalist, the Swedenborgian, the Christadelphian, the Salvation Army, and so forth *ad infinitum*; and, secondly, that the historical Church, which claims relation to the entirety of the nation and of each parish, is only different from private religious associations which claim no relation to the actual order of the universe, by the Church being "established" and the various sects being "free." The Liberation Society aims at forcing upon the English people, by the aid of the State, its own crude and unhistorical hypothesis that there are a number of co-equal "Churches" in England. The difference between the "Established" Church and the so-called "Free Churches," however, is as inherent and permanent as the difference between the real world and this or that man's notions and crotchets about the world. Establishment, however it may be defined, is only an accident in the historical life of the Church; that accident may continue or may cease; but if a Liberationist majority were returned to the House of Commons, and the Church of England were disestablished and disendowed, the inherent and permanent difference between it and the hundred sects would remain the same as ever, and the historical Church would still retain its nationality as one of its dominant notes.

Mr. Rogers devotes a great deal of his space to the internal differences within the Church of England. He gives a lecture apiece to the Low Church and Broad Church parties, and no fewer than four lectures to the High Church party. The utmost praise is due to him for the tolerance, the kindly and intelligent appreciation, and the evident anxiety to state the convictions of each party with fairness, which he exhibits in these lectures. There is no survival of that ferocious ranting which characterized the founders of Independency. When Lord Chancellor Hatton pointed out

Archbishop Whitgift to Henry Barrowe, and asked this truculent father of Congregationalism what he held the Primate to be, Barrowe replied, as he himself tells us (in *A Brief of the Examination of me, Henry Barrowe*, 1586, reprinted after the Restoration, 1662): "He is a monster; a miserable compound! I know not what to make of him. He is neither ecclesiastical nor civil—even that Second Beast spoken of in the Revelation." Barrowe's heir, Mr. Rogers, can hardly find eulogy sufficiently glowing to heap upon Whitgift's heir, Archbishop Tait. He speaks from "the chair of Canterbury"; he is "the Primate of all England"; though he is "a successor of Laud," he has "grasped the true idea of Christian union." Low Churchmen, Broad Churchmen, and High Churchmen, all in their turn come within the field of Mr. Rogers's critical vision, and, as they pass across it, are dismissed with much more praise and sympathy than blame. In some degree or form, they one and all exhibit the virtues of Nonconformity. The manner in which history is twisted in order to bear out this view is characteristic of the lecturer. In his sketch of the rise of the Evangelical movement in the Church of England, he deliberately informs his hearers that "the great aim of Sheldon and his condutors in 1662 was to purge the Church of England of clergymen with the theology of Thomas Scott and the passionate earnestness of John Newton." There can be no doubt that the Evangelical and Methodist movements in the Church of England quickened moribund Dissent, and that the new life of the "Free Churches" was not self-originated, but was communicated to the sects from the spontaneous and vigorous outburst of new life in the National Church. A list of the preaching-houses and chapels built by ordained priests, if it could be collected, would yield a lively illustration of this truth. The facts which Mr. Rogers ought to have produced, however, in order to prove his hypothesis are of a different character. He should have shown that Scott and Newton refused to be ordained priests, to wear the surplice, to kneel at the Eucharist, to use the Book of Common Prayer as we now have it, or to baptize the children of "unbelievers." To say, as he does, that the so-called Evangelical clergy of the eighteenth century, of whom he selects Scott and Newton as types, "set themselves to undo the work which the Act of Uniformity had accomplished," is glaringly untrue. His assertion that "they, Scott and Newton, were the successors of the Nonconformists of whose piety and zeal that fatal Bartholomew's Day had deprived the Establishment," is a proposition which needs a score of qualifications. To a certain degree Scott and Newton may have been the successors of Howe and Owen in some of their doctrinal opinions, but in no degree were they their successors in conduct and practice. Mr. Rogers, having touched the brink of a baseless theorizing, plunges into the full stream of it. He starts the conjecture that if the similarity of conforming priests like Scott and Newton, Venn and Romaine, to the nonconforming Presbyterians and Independents of a former century "had been clear to themselves," or if "it had been detected by the then rulers of the Church," these "new Puritans" would have been turned out of their ministry in the National Church. "It is strange," he adds, "if an Act which expelled Baxter was designed to include John Newton." It is sufficient to reply that if Baxter had done what John Newton did—if he had conformed to the order of the National Church—he would not have been "expelled." The Evangelical clergy of the eighteenth century loyally accepted everything which the Nonconformists of the seventeenth century had refused to accept. It is worth noticing that Scott himself said that Newton's doctrine had little effect upon him, and even served him as a subject of merriment, until his conscience was aroused by observing Newton's self-sacrificing labours as a parish priest, especially in the visiting of the sick.

In his lecture on "The Established Church and the Free Churches," Mr. Rogers takes up once again the sore subject of the Census. He rejoices that the Dissenters were not wronged by Churchmen being permitted to record themselves as Churchmen. The "force of the Established Church," he tells us, would otherwise have been "displayed," not by the production of "actual worshippers, but of those who call themselves" Churchmen. The intolerance which the Liberationists have inherited from the early Independents, while they cast aside so many other traditions of their fathers, was never more evident than in their loud and long shriek to the State not to allow the English people to record their religious profession. They demanded that the State should allow no Englishman to "call" himself a Churchman unless he conformed to the Liberationist definition of Churchmanship. The Dissenter is to settle who is and who is not a true, proper, and legal Churchman. The cry against a Census of religion stands on the same ground as the cry for disestablishment. The State is to legislate upon the lines dictated by Dissent. Mr. Rogers tells us that the State has to take "only one step further" in order to "meet the Nonconformist view." Having decreed "equality of persons," it has now only to decree "equality of Churches." In other words, the Dissenter requires that the State should enforce by law upon all its citizens his own novel theory and definition of a "Church"—a theory borrowed from the accidents of American politics, and one which the founders of the English Dissenting sects would have rejected with horror. The disestablishment of the National Church on the lines dictated by the Liberationists would really be the establishment as the law of the land of the new Dissenting theory that England is full of Churches, and that any religious club is a Church.

## A WILL AND A WAY.\*

"VARIOUS French 'Memoirs,' writes Lady Georgiana Fullerton in her preface, "and especially a very interesting autobiography entitled '*Une Famille noble sous la Terreur*,' furnished the materials for *A Will and a Way*. Most of the characters are drawn from the same source; some of the names are changed." We greatly doubt whether a novelist has any right thus to turn to her own uses the labour of others. Had this autobiography which she so deservedly praises been published in England, it would probably have been for many a long year saved by the law of copyright from the fate which has befallen it. Though this safeguard is wanting to it, nevertheless its merits surely ought to have secured it better treatment. It was fitting that it should be made known to the English reader, but the right way to do this was through a translation. Had our author been content with a piece of work as legitimate as it is unambitious, and had she turned the original into English that was not unworthy of the French in which it was written, she would have received from us nothing but praise. Her method, however, as she herself frankly enough confesses, has been very different. If many were to follow in her steps, autobiographies—at all events, the autobiographies of those whose lives are worth writing—would, we fear, become a thing of the past. Who would patiently submit to have his memoirs thus preyed upon, to have the story of his life altered to suit the purposes of a three-volume novel, to have a couple of lovers tacked on where there was not even one, to have patches stuck on here and there from the memoirs of others, and to have names now given and now changed? There is this comfort, however, that a good autobiography may live for more centuries than a novel sees years. When Lady Georgiana Fullerton's too artificial story shall have disappeared even from the shelves of the seaside circulating libraries, *Une Famille noble sous la Terreur* will still keep its place.

That *A Will and a Way* is, in spite of great faults, an interesting story, we readily admit; but, at the same time, we must not forget that its merits are mostly borrowed, while its faults are all its own. For a long way, if our memory does not play us false, our author keeps very close to the original. Her language, indeed, is so often cast in a French mould that we can scarcely doubt that there are a great many passages which are translated almost word for word. In fact, during a great part of the opening scenes, her style struck us as being awkward and cramped. It nowhere is good, but here it is particularly bad. The following passage will show what we mean. It comes in the first chapter of the first volume:—

Aline heard many conversations which it was not supposed she attended to. She had taken the habit of sitting on a stool at her aunt's feet with a piece of embroidery in her hand, and never raised her head or spoke, but with an intense earnestness and close attention listened to every word that was uttered; and soon she became aware of all that concerned the emigration, and shared the impassioned enthusiasm which made aged men and young nobles, fathers of families and quiet country gentlemen, rise like one man to go and join the exiled princes.

Further on we come upon many such passages as the following:—"It became a question whether to go to bed or not when there was reason to apprehend such a visitation"; "It was always in the neighbouring towns that the hatred of the nobility raged"; "The veillée always ended with the saying of the Rosary, examination of conscience, and night prayers." The author can find, we fear, some justification for the use of the Frenchified English term, "a religious"; but "infirmarians" nowhere passes current for "hospital nurses."

In the changes that she has made to suit her purposes as a novelist she has not been content to confound autobiographies and memoirs; she has done worse than this—she has confused history. A very little care would have saved her from the blunders into which she has fallen, but that care she was either unable or unwilling to take. How gross an error, indeed, is it that makes the Marseillaise march through Lyons on their way to Paris after the dreadful 10th of August! Not, indeed, so gross, yet gross enough, is the blunder into which she falls when she says that Vergniaud's execution drove Charlotte Corday to despair. Vergniaud's head did not fall till more than three months after Charlotte Corday had seen her fourth and last day of "the Preparation of Peace." Later on, the author describes how the news of Robespierre's death was received at Lyons, and how thereupon the heroine set out for Paris. Now Robespierre was guillotined on July 28, and yet it was on the sixteenth of the same month that the girl started, we are told, on her journey. Collet d'Herboles, according to our author, was executed. He escaped the guillotine, as she ought to have known, to die of yellow fever and drink in French Guiana. Errors such as these are not likely to be discovered by many readers, and, even if pointed out, will not be condemned by those who like a modern novel better than an autobiography, and who can take no interest in a heroine who lives to tell how she never had a lover. As might be expected, this story gives the most one-sided account of the great Revolution. Very little—scarcely anything, indeed—is told of the grievous wrongs that the mass of the people had borne for long ages; while the sufferings—dreadful enough, in all truth—of the nobility and the clergy, that lasted but a few years, are described at length. On one side there would seem to be only the

sublime patience of a class that was, as a whole, deeply religious, while on the other were the gross cruelties of the working people. Faithful peasants are, no doubt, introduced, who by their very devotedness only prove how virtuous their priests and their masters must have been. An old workman of Lyons, whose son was a leading Jacobin, is brought in saying, "Dear me, dear me! we used to live quieter lives formerly. I had to work, indeed; but then I was well paid for it, and could eat in peace. I made a waistcoat for King Louis XV., and a lot of money I got for it." No peasant or workman is brought in to tell of the oppressions of all kinds under which he and his fellows had suffered, and of the burdens from which they were at last shaking themselves free. Now and then—but far too rarely—some statement shows that France had not hitherto been altogether and through-out a blessed land. The number of waistcoats that even Louis XV. could wear was limited, and still more limited were his means of paying for even all that he did order. The author, we must do her the justice to admit, has some sympathy even for Robespierre, as the possessor of an immortal soul. There is no one, she apparently believes, so bad but that, by a chance perusal of one or two of the Lives of the Saints and the help of a Catholic priest, he might be reclaimed and converted into a saint himself. Johnson, when he was one day asked his opinion of a certain tragedy in manuscript, replied, "there was too much *Tig and Terry* in it." When Mrs. Thrale burst into a laugh, he said, "Why, what wouldst thou have, child? I looked at nothing but the 'dramatis,' and there was Tigranes and Tiridates, or Teribazus, or such stuff." Now, in the story before us there is too much saint and priest. A Roman Catholic may find it all edifying enough, though to us it is somewhat tiresome. Moreover, we cannot easily forget, in this praise of the Romish Church, that in the South of France, where the scene of the story is mostly laid, is Toulouse. It was only seven and twenty years before the beginning of the Revolution that that unhappy but most innocent old man, the Protestant Jean Calas, was broken on the wheel in that city through the gross superstition of his fellow-citizens. In the North, four years later, the Chevalier de la Barre, on the charge of having injured a crucifix, was put first to the torture and then to death. Let Lady Georgiana Fullerton spare a little time to read that blood-stained page of history, and see what part the Bishop of Abbeville bore in this horrible persecution. Let her read Voltaire's words of warning to the Church—words which had their fulfilment far earlier and far more terribly than even he who uttered them could have expected:—"Il faut avouer," he wrote, "que s'il y a quelques cas où un monitoire est nécessaire, il y en a beaucoup d'autres où il est très-dangereux. Il invite les gens de la lie du peuple à porter des accusations contre les personnes élevées au-dessus d'eux, dont ils sont toujours jaloux. C'est alors un ordre intimé par l'Eglise de faire le métier infâme de délateur." Our author makes her hero say of Charlotte Corday, "She had once been very religious. It was the works of Rousseau and Voltaire that undermined her faith." Whatever blame Voltaire may deserve by more than one part of his writings, we can never forget that he was the foe to tyranny of every kind, and that he taught a lesson of tolerance which had it been learnt by the Church and the ruling class, would have averted the Reign of Terror. But it would seem idle to argue on such matters with one who, like our author, regards the Jesuits as "the vanguard of the Church's army of apostles and martyrs."

However, she will find readers of her own, who will be full of admiration for the virtuous peasant-woman who rejects her lover, to whom she was deeply attached because he was a Protestant. It was not, by the way, the fault of the army of the Church, or of its vanguard either, that in the neighbourhood of the Cévennes, where this good Catholic lived, there was a single Protestant to be found. No less will they admire the sudden conversions that take place. To the common reader they may seem, indeed, almost passing belief; but those who have been fed on one class of literature will, no doubt, find in them nothing strange. Such incidents as these, however, would better find a place in a series of tracts than in an historical novel.

We regret that there is so little praise that we can bestow on this work. There is something that we like in the author, but the faults that she here commits are too great to be overlooked. She gives a false view of the period which she describes, and of the Church of which she is so devout a daughter. At the same time she takes a genuine piece of autobiography and twists it to suit her purposes with as much coolness and with as great an indifference to the real facts as if she were herself one of the authors of the Lives of the Saints. As if these failings were not in themselves enough, she too often falls into a style which, however praiseworthy it might be in a Frenchman who should attempt to write in our language, cannot easily be forgiven in an English-woman who would persuade herself and her readers that she is writing English.

## NOTICE.

We beg leave to state that we decline to return rejected Communications; and to this rule we can make no exception.

## PARIS.

Copies of the SATURDAY REVIEW may be obtained every Saturday of M. FOTHERINGHAM, 8 Rue Neuve des Capucines.

\* *A Will and a Way*. By Lady Georgiana Fullerton, Author of "Too Strange not to be True," "A Stormy Life," &c. 3 vols. London: Richard Bentley & Son. 1881.

Special train and boat service, Friday, 2.10 P.M., returning Monday, 7 A.M.—Apply to Miss PHAMING, Manageress (late of the Langham Hotel).

**BEDFORD HOTEL, BRIGHTON.—FAMILIES or GENTLEMEN** intending to visit the Hotel are respectfully solicited to address their applications for rooms as early as possible, the Manager being very desirous of not disappointing his esteemed patrons.

## SPECTACLES versus BLINDNESS.

**ONE-FOURTH** of those suffering from blindness can trace their calamity to the use of common spectacles or lenses imperfectly adapted to the sight. Mr. HENRY LAURANCE, F.R.S., Oculist, Oculist, PERSONALLY adapts his Improved Spectacles at his residence, 3 Buteleigh Gardens, London, daily (Saturdays excepted) ten to four. SIR JULIUS BENEDICT writes:—"I have tried the principal opticians in London without success, but your spectacles suit me admirably. The clearness of your glasses, as compared with others, is really surprising." DR. BIRD, Chelmsford, late Surgeon-Major, W.E.M., writes:—"I could not have believed it possible that my sight could have been so much improved and relieved at my age, 62. I can now read the smallest print, although suffering from cataract on the right eye." Similar testimonials from Dr. Radcliffe, Consulting Physician, Westminster Hospital; Ven. Archdeacon Palmer, Clifton; Major-General Spanglin, C.B. Aldershot; the Rev. Mother Abbess, S. Mary's Abbey, Hendon, and hundreds of others. Mr. Laurance's Pamphlet, "Spectacles, their Use and Abuse," post free.

**FURNISH YOUR HOUSE or APARTMENTS THROUGHOUT on MODERN HIRE SYSTEM.** The original, best, and most liberal. Cash Prices; no Extra Charge for time given. Large, useful Stock to select from. Illustrated and priced Catalogue, with Terms, post free, 34d., 24d., and 25d. Tottenham Court Road, and 119, 20, and 131 Morwell Street, W. Established 1852.

## HEAL & SON

HAVE ADDED

## SITTING-ROOM FURNITURE

TO THEIR VERY LARGE STOCK OF

## BEDROOM FURNITURE.

A Catalogue of BEDROOM FURNITURE, with 600 Designs, sent free by post.

HEAL &amp; SON, 195 to 198 TOTTENHAM COURT ROAD, LONDON, W.

## DECORATION.

CARTER, 6A New Cavendish Street, Great Portland Street, London, W.

## WILLS'

## NEW SMOKING TOBACCO.

## "AUTUMN GOLD."

Possesses great Delicacy and Mildness, and is especially suitable for Cigarettes. In 4 oz. and 2 oz. Boxes only, with Name and Trade Mark. Price 12s. per lb.

W. D. &amp; H. O. WILLS

## ROBT. ROBERTS & CO.'S CELEBRATED TEAS.

12 lbs. AND UPWARDS CARRIAGE PAID.

Samples and Price Lists free by post.

## QUEEN INSURANCE BUILDINGS, LIVERPOOL.

ESTABLISHED 1840.

NO AGENTS.—All Orders and Communications Direct.

**CHRISTMAS PRESENTS.**—Nothing is so highly appreciated as a case of GRANT'S MORELLA CHERRY BRANDY, which can be ordered of any Wine Merchant. Queen's quality, as supplied to Her Majesty, the Emperor, and the Sultan's special quality, 50s. per dozen.—Manufacturer, T. GRANT, Distillery, Maidstone.

## CITY OF LONDON BONDS—DISCHARGE AND RENEWAL

In obedience to an Order of the Finance Committee of the Corporation of London, I do hereby give notice to the holders, registered or otherwise, of City Bonds, which mature within the ensuing year, 1882, as follows:

(1.) That the Bonds referred to in the First Schedule hereto will be paid off (out of funds specially applicable to such purposes) absolutely and without option of renewal, at the dates at which they respectively mature.

(2.) That the Bonds referred to in the Second Schedule hereto will also be paid off at the dates of their maturity respectively, but that an option is given to the holders of such Bonds to renew the Loans severally secured for a period of Ten Years from the dates at which they severally fall due by Bonds to carry interest at the rate of 2½ per cent. per annum, but to be issued to present holders at 105 per cent, which will pay them a full rate of 2½ per cent. per annum.

Holders of Bonds desiring to avail themselves of this option of renewal must signify to me their agreement thereto, and bring their Bonds for marking to this Office, on or before the 31st of December next.

The Loans renewed under these options will be for the like purposes and on the same securities as the existing Bonds, interest being payable, as at present, by means of Coupons, at the Bank of England, negotiable through any banker.

## SCHEDULE I.

Bonds to be paid off absolutely.

Bonds issued under the Holborn Valley Improvement Act, 1861, and maturing on January 1, 1882, viz.:	
25 Bonds for £1,000 each, Nos. 309 to 400, 770, 849 to 868, and 915 to 921.....	38,000
40 Bonds for £500 each, Nos. 561 to 597, 809 to 861, and 925 to 943.....	21,000
41 Bonds for £100 each, Nos. 513 and 544, 819 to 848, 895 to 914, and 916.....	4,100
Bonds issued under the same Act, and maturing on June 30, 1882, viz.:	
22 Bonds for £1,000 each, Nos. 1,510 to 1,531.....	22,000
4 Bonds for £100 each, Nos. 1,569 to 1,595.....	400
Bonds issued under the same Act, and maturing on July 1, 1882, viz.:	
92 Bonds for £1,000 each, Nos. 110, 400 to 421, 560 to 595, and 936 to 988.....	92,000
16 Bonds for £500 each, Nos. 508 and 509, and 1069 to 1,081.....	8,000
20 Bonds for £100 each, Nos. 540 to 559, and 1,005 to 1,017.....	2,800
Bonds issued under the same Act, and maturing on December 31, 1882, viz.:	
26 Bonds for £1,000 each, Nos. 1,568 to 1,591.....	26,000
	218,900

Bonds issued under the Contagious Diseases (Animals) Act, 1869, for constructing the Foreign Cattle Market for the Metropolis, maturing on January 25, 1882, viz.:

2 Bonds for £10,000 each, Nos. 1 and 2.....	20,000
Part of Bond for £10,000, No. 3.....	6,000
	26,000

Bonds issued under the Billingsgate Market Act, 1871, and maturing on March 19, 1882, viz.:

4 Bonds for £1,000 each, Nos. 241 to 244.....	4,000
---	-------

Bond issued in respect of rebuilding the Royal Exchange (Loan of £78,000), secured upon the City's moiety of the Gresham Estate, viz.:

Bond for £1,000, No. 3, maturing on May 11, 1882.....	1,000
---	-------

Part of Bond issued under the Act for Rebuilding Blackfriars Bridge, viz.:

No. 101 for £50,000, maturing on July 26, 1882.....	50,000
	25,000

Total..... £71,900

## SCHEDULE II.

Bonds maturing in 1882 with an option of renewal.

Bonds issued under the Contagious Diseases (Animals) Act, 1869, for constructing the Foreign Cattle Market for the Metropolis, maturing on January 25, 1882, viz.:

Part of Bond for £10,000, No. 3.....	4,000
4 Bonds for £10,000 each, Nos. 4 to 7.....	40,000
1 Bond for £5,000, No. 8.....	5,000
	49,000

Bonds issued under the Act for providing the Metropolitan Cattle Market, Tillington, and maturing on January 30, 1882, viz.:

2 Bonds for £10,000 each, Nos. 728 and 753.....	20,000
1 Bond for £4,000, No. 704.....	4,000
	24,000

Bonds issued under the Billingsgate Market Act, 1871, and maturing on March 19, 1882, viz.:

11 Bonds for £1,000 each, Nos. 245 to 255.....	11,000
6 Bonds for £500 each, Nos. 256 to 261.....	3,000

750 Bonds for £100 each, Nos. 501 to 1,250.....	75,000
	450,000

Bonds issued under the Act for Re-building Blackfriars Bridge, and maturing on July 26, 1882, viz.:

Part of Bond, viz. No. 101 for £50,000.....	25,000
3 Bonds for £50,000 each, Nos. 126 to 128.....	150,000
	175,000

Bonds issued under the Act for providing the Metropolitan Cattle Market, Tillington, and maturing on October 10, 1882, viz.:

10 Bonds for £5,000 each, Nos. 514 to 523.....	50,000
--	--------

Bonds issued for the like purpose, and maturing on October 31, 1882, viz.:

18 Bonds for £1,000 each, Nos. 524 to 541.....	18,000
4 Bonds for £500 each, Nos. 542 to 545.....	2,000
	20,000

Total..... £1,011,000

Further information, if needed, will be furnished at this Department.

Chamber of London, Guildhall,  
October 21, 1881.

BENJAMIN SCOTT, Chamberlain.

EPPS'S  
COCOA.

GRATEFUL

AND

COMFORTING.

Made simply with boiling water or milk.

JAMES EPPS & CO., Homoeopathic Chemists, Makers of Eppe's Chocolate  
Especially, for afternoon use.

GOLD MEDAL, PARIS.

FIRST AWARD, SYDNEY.

FRY'S COCOA EXTRACT.

Guaranteed pure Cocoa only, deprived of the superfluous oil.

"Strictly pure, and well manufactured."—W. W. BRIDGEMAN, City Analyst, Bristol.

NO MORE MUSTARD!—The appetite-compelling KAVOS.  
The Condiment of Condiments. The most delightful Food. Good with all Meats.  
Wholesome, Digestive, Assimilative. In Mouthful Bottles, 1s. each. Of all Grocers.

DR. LEBROCK'S PULMONIC WAFERS relieve the most  
violent Cough in Ten Minutes, protect Weak Lungs from all the irritation  
of Puff and Frost, and strengthen and clear the Voice, Throat, and Chest. They taste  
pleasantly. Price 1s. 1½d. and 2s. 6d. per box. Of all Druggists.

## LIFE ASSURANCES, &amp;c.

## SUN FIRE OFFICE.

THREADENEEDLE STREET, E.C. CHANCING CROSS, S.W.  
OXFORD STREET (Corner of Vere Street), W. Established 1710.  
Home and Foreign Insurance effected. Sum Insured in 1880, £202,745,000. LIGHTNING  
LOBBES, whether by Fire or Concussion, admitted.

FRANCIS B. REITON, Secretary.

## NORTHERN ASSURANCE COMPANY.

Established 1838. 1 MOORGATE STREET, LONDON.

## BOOKS, &amp;c.

The Circulating Library is kept amply supplied with all important Works  
of the present and past Seasons, and includes the most recent Foreign Publica-  
tions and the newest Music.

## THE GROSVENOR GALLERY LIBRARY

Comprises an English and Foreign Circulating Library, provided with all the best  
and newest Literature, a Library of Vocal and Instrumental Music, a Reference  
Library, Reading, Writing, and News Rooms, supplied with the Daily and Weekly  
Journals, Ladies' Drawing-Room, Dining and Luncheon Rooms, Smoking-Room,  
and all the appliances and comforts of a first-class Club.

All the Books in the Library, both English and Foreign, are available for  
Subscribers without distinction as to amounts of subscriptions; and Subscribers,  
at their option, may have volumes of Music instead of Books.

## TERMS OF SUBSCRIPTION.

## TOWN.

CLASS	HALF YEAR.	ONE YEAR.
	£ s. d.	£ s. d.
A—TWO VOLUMES.....	0 12 0	1 1 0
B—THREE VOLUMES.....	0 18 0	1 11 6
C—FOUR VOLUMES, delivered free.....	1 4 0	2 2 0
D—SIX VOLUMES, do. do.....	1 16 0	3 3 0
E—EIGHT VOLUMES, do. do.....	2 8 0	4 4 0

And Two Volumes for each additional Guinea per annum. Sets of Books are  
divided to meet the convenience of Subscribers.

Subscribers D and E are entitled to all the Club privileges, including the use of  
the Reference Library, the Reading and Writing Room, Ladies' Drawing Room,  
&c., and are also entitled, upon a further payment of Two Guineas per annum,  
to introduce One Friend into the Room, set apart for Members.

## CLUBS AND LITERARY INSTITUTIONS.

L—EIGHTEEN VOLUMES.....	3 12 0	6 6 0

Subscription N to Club privileges only, as described above, Two Guineas per  
annum.

Subscribers I and K are entitled to all the Club privileges as above.

Subscribers L and M are entitled to the Club privileges for themselves and for  
one additional member of the family.

Boxes for the Conveyance of Books to Country Subscribers are provided by the  
Library free of charge.

## THE DINING ROOMS.

The Dining Rooms are open for the supply of Luncheons, afternoon Teas, and  
Dinners, and Members of the Library will also be able to make arrangements for  
Dinner to private parties.

The Club Dinner, price 3s. 6d., is served every evening, Sundays included, from  
5.30 to 8.30 P.M.

Cheques and P.O. Orders should be made payable to Mr. CHARLES ALLEN, the  
Librarian, who will promptly furnish all further information upon application.

## SURPLUS BOOKS.

Surplus Copies of important Works withdrawn from circulation for Sale at the  
lowest current prices. The October List of Surplus Books post free on application.

## THEATRICAL TICKET OFFICE.

A Theatrical Ticket Office is now open, at which seats can be booked in advance  
for all the Operas, Theatres, and Concerts, &c. Seats secured by letter or telegram.  
Special Terms to Subscribers to the Library.

### WORKING OF THE LAND COURT.

THE Court which Mr. GLADSTONE has established for the disciplining of Irish landlords has at last begun its operations in earnest, and perhaps the shortest and most significant account of the result of this beginning is that Mr. F. H. O'DONNELL, M.P., is jubilant, and that there is reason for his jubilation. Mr. O'DONNELL, at a time when persons much more deeply identified than himself with the Parnellite cause have either fled the country or remained discreetly silent, has taken upon himself to do battle for the suspects, and has fought the battle, on the whole, very fairly, so that there is no need to speak of him with any disrespect. At the same time it is tolerably safe to say that the jubilation of Mr. O'DONNELL ought to make most Englishmen rather uncomfortable. There is cause for such discomfort, though Mr. O'DONNELL, with characteristic haste, seems to have forgotten that the decisions which give him such pleasure are those of a Sub-Commission only. In the mere fact that these first test cases have resulted in decisions very adverse to the landlords, there would be no reason either for exultation on one side or for alarm on the other, for there is no doubt at all that there are such things as excessive rents in Ireland. It is when the evidence laid before the Commissioners is examined, and the principles which seem to have guided their decisions are laid bare, that the reasons for Mr. O'DONNELL's jubilation appear. And it is then that the absolute justice of the view put forward on the Opposition side in Parliament during the passing of the Bill appears likewise. If the decisions in the Castleblayney and Belfast Sub-Commissions are upheld, then one famous remark of Mr. FORSTER's is falsified, and one equally famous remark of Mr. PARNELL's is justified. For the Castleblayney decision, to be understood at all, requires the admission of the principle which Mr. FORSTER declared to be most unfair—the principle that the tenant's right must be carved out of the landlord's; and the Belfast decision, or rather the principle enunciated during the hearing, leads up, if it does not amount, to the adoption of Mr. PARNELL's standard of "prairie value."

The net result of the Castleblayney case was that the rent was reduced by more than twenty-five per cent., with the effect that the Court valuation of ten acres exceeds GRIFFITH's valuation for eight acres by six shillings only—in other words, the rent has been reduced considerably below what used to be the Land League standard. The important points of the decision are not, however, to be discerned in this statement. They are, that the tenant who alleged that his rent was too high had refused 150*l.* for his tenant-right, and that he himself had been until recently an absentee tenant residing at Manchester, where he had a situation on the Lancashire and Yorkshire railway, and leaving his wife to manage the farm. That is to say, this fortunate person not only received the wages on which it is to be presumed his comrades at Manchester subsist, but held a property in Ireland which he himself values at more than 150*l.* after paying his old rent. Obviously there is here no consideration of *affetum affectionis*, since the tenant had so little affection for his land that he did not care to live on it. Obviously, also, there must have been a considerable margin of profit over the old rent, since the tenant did not consider the capitalized value of that profit to be represented sufficiently by 150*l.* It follows that the only possible explanation of the Commissioners' decision is that they assessed the

positive value of the farm (which they are said to have examined with great care), deducted from this the annual value of the supposed tenant-right, and fixed the remainder as the rent. This is the exact process which was protested against in Parliament, which was admitted to be unfair, and which was thought to be precluded by the omission of the original definition of fair rent. It follows, too, that if the tenant-right of McATAVEY's farm at the rent of nearly nine pounds was in the market 150*l.* or more, it will reach a considerably higher figure now that the rent is six guineas. Consequently, at the expiry of the first fifteen years' tenancy, a larger sum still will have to be deducted, and the landlord's share will sink in proportion, exactly as has been predicted a hundred times. It is to be supposed that this case will be reheard before the Judicial Commissioner and his colleagues, and it is impossible to exaggerate the importance which will attach to the rehearing.

The Belfast cases are not yet completed, and therefore cannot properly be the subject of comment, except as concerns a general principle which the chief Sub-Commissioner asserted, and which has given as much cause for jubilation as that implied, if not asserted, in the Castleblayney decision. The case was one in which a lease had been granted, with a clause to the effect that all improvements, by whomsoever made, should become the property of the landlord when the lease expired. This happened years ago, and the tenancy was renewed. The Sub-Commissioners now hold that under the clause stating that no rent should be chargeable on improvements made by the tenant or his predecessors in title, the element of the improvements, unless evidence of their having actually been made by the landlord was produced, must be excluded. Thus not only is the onus of proof, contrary to general expectation and to the apparent meaning of the words of the Act, shifted from the tenant to the landlord, but even an express agreement made, with no allegation of coercion in the making, and terminated years before either the Act of 1870 or the Act of 1881 was thought of, is not held to be evidence of the landlord's proprietary right. This point, as a matter of course, will go before the Chief Commissioners; and, indeed, the Sub-Commissions, which are instituted to deal mainly, if not wholly, with fact, are not very suitable tribunals for even an interim decision on points of pure law. But the dilemma is serious. A reversal of Mr. Sub-Commissioner GREEN's decision would excite a loud outcry in Ireland, and probably check the present eagerness to take the benefits of the Act. A confirmation of it would penalize landlords in a way which it is tolerably certain Parliament neither intended nor even contemplated as possible. It is too obvious even to require demonstration that if this property had been sold in 1863, when the lease expired, the purchaser would have been expected to pay for the improvements which the tenant (with as full knowledge of the limit of his enjoyment of those improvements as any London householder who puts into his house a marble chimney-piece or into his garden perennial shrubs) had made. His bargain would have been in every sense legal and equitable; yet, according to Mr. Sub-Commissioner GREEN, he would have to submit to-day to an indefinite loss upon it.

The unfortunate confusion caused by the uncertainty of the Government views and their frequent changes during the debate on the Bill is well illustrated by a phrase in an

otherwise careful, and impartial report of these proceedings in the *Daily News*. The writer says that the principle on which a fair rent is to be fixed is the consideration of what a solvent tenant, taking one year with another, could afford to pay. There was such a phrase in the Bill as it entered the House of Commons, but there was none such when it left it, for the simple reason that it had been amply proved to be utterly inadmissible. This very Correspondent himself points out the reason of the omission forcibly enough when he avows his doubts as to how the Commissioners will manage those estates in Connaught where the holdings—and there are many such—are simply insufficient to support a tenant in solvency at any rent whatever. In other words, if fifty acres are held in one tenancy, the tenant may live and the landlord receive a fair rent; if they are held by ten tenants, the tenants will starve and the landlord get nothing. Yet all these wretched holdings are probably saleable, and, on the precedent of the lucky McATAVEY, the rent will have to be reduced; logically speaking, it will on that precedent have to be done away with altogether, and a rent-charge on the landlord substituted for it as a bonus to the tenant. To the thousands and tens of thousands of tenants who are crowding the Land Court this must be a pleasant reflection. As for the landlords, though the Act bears the words “having regard to the interest of landlord and tenant respectively,” they seem to be left out of consideration. There is nothing in this to astonish those who have followed the matter from the first; but it is as well to remember the earnest and almost violent disclaimers of any possible damage to the landowner which Mr. FORSTER and Mr. GLADSTONE have repeatedly made. That the construction placed on the last provision of Clause 8 by Sub-Commissioner GREER in the Belfast case causes such damage is too clear to need argument. The Chief Commissioners must decide whether they will adopt that construction or whether they will not.

#### THE GERMAN ELECTIONS.

THE final result of the elections to the German Parliament is still a subject of speculation, for in no less than ninety constituencies a second ballot will be necessary; but enough is known to make the future composition of the Parliament tolerably certain. The total number of members is 397; and in the present, as in former Parliaments, there will be found four main groups. There are the Conservatives, who may be relied on to support Prince BISMARCK in anything he proposes; the Centre, or Clerical party, who go with or against the PRINCE according as they think they have most to gain from him; the Liberals, who, with very varying degrees of decisiveness, oppose the PRINCE when they very much disagree with him; and a very miscellaneous group of outsiders, partly consisting of Particularists and Socialists, who object to the present order of things in the Empire, and Nationalists like Poles, Alsations, and Danes, who object generally to everything German. These outsiders and the Centre will probably remain numerically very much what they were in the last Parliament; the Conservatives have lost, and the Liberals have gained. If every Conservative and the whole of the Centre voted with Prince BISMARCK, and all the Liberals and every member of the miscellaneous group voted against him, he would be beaten. The majority against him would be very small, perhaps half a dozen votes, but it would be a majority; and, although the contingency is very unlikely to happen, and there is scarcely any question on which the parties would put forth their whole strength and range themselves on opposite sides, still the best beginning of any estimate of the present Parliamentary position of the CHANCELLOR is to recognize that the Conservatives and the Centre together may not constitute a majority of the new Chamber. If the PRINCE can come to terms with the Centre, and will make such offers to them as will ensure their hearty, unanimous, and persistent support, he would have a practical majority, for his supporters would work together and his opponents would not. But the measures on which he has set his heart, the State Insurance Bill and the Tobacco Monopoly, are far too big to be got through by a bare majority dependent for its existence on the want of cohesion in its opponents. He asked Germany to send him a Parliament that might be relied on to pass these measures, and Germany has refused. He must wait

until time has wrought a sufficient change in public opinion, or, if he introduces his measures prematurely, it is scarcely possible that he should escape an ignominious defeat.

There are some minor features in the electoral returns which deserve notice. The Liberal party has not only increased in numbers, but has largely altered its character. The ranks of the National Liberals have been sadly thinned, and the ranks of the Secessionists and Progressists have got very much larger. In other words, the half-hearted opponents of Prince BISMARCK have become few, and the decided opponents of the PRINCE have become many. There are several causes to which this result may be attributed. The strength of the Liberal party lies in the educated middle class, and this class has lately become antagonistic to Prince BISMARCK. He has offended its economic tastes both by his Protectionist measures and by his leaning towards Socialism. He has not openly countenanced the Jewish persecution, but he has carefully abstained from openly discountenancing it, and the Court Chaplain, who has made himself conspicuous by his extreme bitterness against the Jews, was a favourite, though a defeated, Conservative candidate in Berlin. Nine-tenths of the Liberal party regard the persecution of the Jews with shame and disgust. The PRINCE has made some concessions to the Clericals, and threatens to make more; and German culture is dear to the party which thinks it exhibits it to perfection. But what has determined the success of the Liberal party more than anything else is the spirit in which, under Prince BISMARCK'S directions, it has been opposed. Nothing can exceed the vulgarity of the coarse and wholesale abuse, or the offensiveness of the arrogance, which has marked every line of the official press during the electoral struggle. The Liberals were the scum of the earth, and what Prince BISMARCK ordered every German was bound silently to accept. The Liberal vote has been the protest of self-respecting men against the vituperation, the bullying, and the domineering of the Government. The issue, to the minds of the independent classes, was not so much how Germany was to be governed, or what measures were to be rejected or adopted, but whether even German worms dared to turn when trodden on too heavily.

The appeal to the Socialists made by the PRINCE may be said to have failed. It appears, indeed, that fewer electors have gone to the poll as declared Socialists, and the total number of Socialist members will not be greater, and may be less, in the new Parliament than in the last. But the Socialist vote, when not given to Socialists, has evidently not been given in any large degree to the Conservatives for whom it was asked. Probably many Socialists abstained, as under the new law they were not allowed to march together to the poll; and those who voted may have thought that the best means of securing themselves against their votes being thrown away was to vote for a Clerical, a Protectionist, or a member of the Party of the People. But although scarcely any Socialists have been returned, the Socialists have been strong enough to obtain the chances of a second ballot in no less than thirty constituencies, and these constituencies are almost without exception constituencies in the first towns of Germany. To descend to a smaller matter, it may be observed that all the well-meant and unsparing efforts of the German Government to humour Alsace have been so far ineffectual that now not a single Alsatian member represents the party of conciliation, and the whole body joins in a protest against the new and unwelcome nationality that has been imposed on the inhabitants of the conquered territory. It may be added, that among the rejected Conservatives is a son of the CHANCELLOR, and thus Prince BISMARCK has a family and private grief to swell the list of the causes of such mortification as he may be supposed to be now enduring.

The first step of the CHANCELLOR when the general result of the elections became known was to intimate to the Centre that now was the time for it to bid high for his favour, and to expect from him the favours to come by which he would show his gratitude. His next step was to allow the suggestion to get abroad that he might very probably kill this unpleasant Parliament before it began to live, and that it would meet only to be dissolved. His last step has been to hint to a set of over-zealous students that the best thing for him and for them is to show themselves patient in the hour of adversity. The policy of patience

may be looked on as the policy which, at least for the moment, the *Pretor* has thought it wise to adopt. Germany has no wish to get rid of Prince BISMARCK. It cannot live without him, and all it asks is to be able to live with him in some endurable fashion. It does not like the kind of Socialism which reveals itself by schemes for bribing the poor on the eve of an election. It sees in his tobacco monopoly the increase of the bureaucracy it dreads, and the prospect of smoking cigars worse, if possible, than those to which it has been accustomed. It has some little difficulty in putting up with his own hectoring ways, and it keenly resents the foul language and brutal insolence of his underlings. If he would only be a little more civil himself, repress the abusive arrogance of his satellites, let his new-fangled Socialism go to sleep, allow bad tobacco to be sold at the present price, and not keep quite so strict a state of siege in the larger towns, Germany would be as ready to adore and follow him as it ever was. It does not seem very much for a great and docile nation to ask, even from the man who has made it what it is.

#### THE BOERS AND THE GOVERNMENT.

THE acceptance of the Convention by the Transvaal Volksraad appears to have been accompanied by an elaborate remonstrance or protest against its principal provisions. The three leaders who form the Government had invited such an expression of opinion, although they were pledged to obtain the ratification of an agreement negotiated by themselves. The anomalous Address or Report of the Assembly may probably have been composed as a summary of reasons for rejecting the Convention. The language used by the leaders at the first meeting of the Volksraad was apparently suggested by a belief that there were no limits to the pliability of Mr. GLADSTONE and his colleagues. When the PRIME MINISTER announced at Leeds that the list of concessions was exhausted, the Triumvirate perhaps began to suspect that it might be necessary in some sense to recognize their engagements; but they may still have thought it possible that Mr. GLADSTONE would once more retract formal declarations if he were encountered by menace and refusal. The formal ratification of the treaty was probably the immediate result of military movements. The march of the troops returning to Natal was suspended, and it was known that in a short time Sir EVELYN WOOD would command an irresistible force. With the worst possible grace the Government and the Assembly withdrew their threats, and hereafter they will contend that they have given full notice of their intention to disregard their solemn obligations. Since the beginning of the negotiations the Boers have not been conspicuous for good faith. The members of their community who had committed three brutal and treacherous murders were only subjected to the inconvenience of a sham trial before a sympathizing jury. The leaders have not exerted themselves to correct the misapprehensions of their malcontent countrymen.

It might perhaps scarcely be worth while to discuss the resolutions of the Volksraad, if they had not included a proposal which tends to the direct and immediate violation of the treaty. If report can be trusted, the Volksraad requests the Boer Government to communicate the protest to all foreign Powers; yet at the same moment the Volksraad approved the Convention which prohibits the local Government from entering into any international relations. An appeal from the Suzerain to France, Germany, Holland, the United States, and other Powers is an insolent and wanton affront to the Imperial Government. For all diplomatic purposes the Transvaal is a portion of the British Empire, although it is entitled to administrative independence on the conditions which were settled between the English Commissioners and the leaders of the insurgents. Any foreign State which had an interest in the question could ascertain that the representatives of the Transvaal had agreed to leave the conduct of foreign transactions to the Imperial Government. A complaint against the Sovereign, addressed to a foreign State, is technically an act of treason. In the present instance it involves a breach of promises simultaneously made. The great colonies, which are incomparably more powerful and more important than the Transvaal, are content to leave their foreign relations to be regulated by the Foreign Office. The only foreign interests which the Boers are

likely to value or cultivate would be hostile to the Imperial Government. It would be intolerable that a petty community holding part of a vast region now subject to the English Crown should have the opportunity of introducing European competitors for sovereignty into the heart of South Africa. Ample precautions have been taken against the introduction of similar complications into India. The French at Pondicherry, and the Portuguese at Goa, are prohibited from forming alliances with native States. The reservations in the Convention are not intended to apply to the native tribes. Other precautions, which may perhaps not be uniformly effective, have been taken against the risk of border wars. Before the annexation the Boers never affected to hold diplomatic intercourse with any but the English Government. They have no reasonable claim to novel privileges after the untoward events which caused the restoration of their independence.

If the resolutions of the Assembly have been officially communicated to the English Government, it might be prudent to suspend any acknowledgment of the ostensible ratification of the Convention. The proposed breach of one of the most important stipulations shows that the Boers consider themselves at liberty to violate any other article of the Convention. At one time they objected to the renunciation of the right of foreign intercourse, on the pretext that they might find it expedient to negotiate commercial arrangements with the Portuguese of Delagoa Bay. Their present claim is more ambitious, for they ask foreign Powers to recognize the supposed injustice of stipulations by which, nevertheless, they profess to be bound. No Government could, without a breach of international comity, take cognizance of their grievances—which, indeed, are for the most part little calculated to win impartial sympathy. The protest of the Volksraad against religious toleration might suit the popular feeling of Spain, except that the Boers are not Roman Catholics, but Calvinistic Puritans. The objection to the prohibition of slavery which is contained in the Convention would be peculiar to themselves. It is true that their maintenance of compulsory servitude is ingeniously distinguished from slavery; but they would have no reason to complain of the prohibition if it were in no case likely to take effect. No civilized Government will openly countenance a retention of the right of holding slaves. If the clauses for the protection of the natives were struck out of the Convention, the Boers who now affect to treat the stipulations as unnecessary would plausibly argue that the right of the English Government to prevent slavery had been deliberately renounced. Any reasonable objections to the complicated provisions for the protection of the natives might perhaps hereafter deserve consideration. The English Government has incurred responsibilities which it may find difficult to discharge, for a general protectorate includes, among other consequences, the duty of restraining the natives from encroachment. It will in some degree be the interest of the dominant race to treat the vast coloured population with some degree of justice and consideration. The Imperial Government cannot honourably abdicate the pretensions which it has advanced, but it will be well advised in renouncing frequent and minute interference.

As long as the Boers display their present temper it will scarcely be prudent to withdraw the forces which have procured even nominal concessions. Half the number of troops might perhaps have sufficed but for the encouragement which was given to the insurgents by the surrender of the English Government. It is not known whether during the subsequent negotiations the Commissioners were controlled by detailed instructions from home. They must constantly have regretted the rejection of Sir EVELYN WOOD's advice that the military superiority of the English forces should be asserted before the beginning of the discussion. If the short campaign had ended with a decisive English victory, the leaders would not have broken faith with the Imperial Government, nor would the Volksraad have appended to its assent an argument against the chief provisions of the Convention. A proposed address to foreign Powers would certainly not have been thought of, if the Convention had assumed its proper form of a boon to the insurgents. For any sacrifices which they have nominally made full consideration has been given in the abandonment of the attempt to re-establish English authority. The demeanour of the Volksraad and of the Boer Government is not encouraging to the English residents and loyalists, who are at least as fully entitled to protection as the natives. It is uncertain whether their right to dis-

sent from the dominant faith is seriously threatened, though the stipulations for the maintenance of religious liberty would seem to indicate some fear of the intolerance of the Boers. Their property and just rights are probably in graver danger than their conscientious convictions. It may be taken for granted that the English residents in the small towns and villages will not be compelled to leave the country, as the rural Boer population is almost wholly employed in agriculture; but, unless the purpose of maintaining the Convention is vigorously asserted, loyal farmers will almost certainly be exposed to maltreatment and expulsion. The whole series of transactions illustrates the inconvenience which results from political timidity. The partisans of the Government described as a splendid proof of courage unprecedented readiness to acquiesce in the consequences of defeat. The result has been incessant encroachment on the part of the Boers, and an ostensible treaty which settles nothing, inasmuch as one party to the bargain seeks to violate its conditions at the very moment of ratification. The Government will prepare the way to future difficulties if it tolerates the pretension of the Volksraad to communicate its criticisms on the treaty to foreign Powers.

#### HOME POLITICS.

AS Mr. GLADSTONE explained to his admirers at Leeds that, being an old man, he could not last for ever, and at the same time comforted them by the recollection that he would leave behind him two excellent and competent leaders of the party in Lord GRANVILLE and Lord HARTINGTON, it was almost inevitable that at an opportune moment some ingenious speculator should declare that what might happen had happened. There is nothing more agreeable than to inspire the belief that the innermost secrets of political life have been revealed to some exceptionally trustworthy and important outsider. It is a pleasant day with a journalist when he thinks that, if he cannot instruct the world, he can, at any rate, surprise it. The retirement of Mr. GLADSTONE was a theme especially tempting to any one who wished to give speculation the form of announcements. It was a safe field, for Mr. GLADSTONE had himself said that he must some day retire or be withdrawn from public life; and it was a very wide field, as the separate contingencies had to be considered of Mr. GLADSTONE remaining Premier but giving up the Exchequer, and of his abandoning office altogether. Speculative ingenuity was equal to the occasion. It shuffled its cards to its perfect satisfaction. It put Mr. CHILDERS into the Exchequer, and Sir CHARLES DILKE into the Cabinet, and after full, and apparently very deliberate, reflection, it ordained that, if Mr. GLADSTONE ceased to be Premier, he must give up public life altogether, and retire to meditate in the groves which he loves to cut down. The public smiled; but, utterly indifferent to fanciful combinations, it only asked whether it was true that Mr. GLADSTONE was on the eve of quitting office. Mr. GLADSTONE telegraphed to say that he had nothing to add to his public utterances. He was an old man a month ago at Leeds, and he is now older by a month. That was all he had to say in reply to the announcement that he was going to throw up the seals of office. Sir WILLIAM HARCOURT, a day or two afterwards, remarked that, if Mr. GLADSTONE was going to resign, it was at least rather odd that he had never given the slightest hint of his intentions to any of his colleagues. If health and strength permit Mr. GLADSTONE to continue his labours, it is inconceivable that he should wish to retire now. The Parliament is his Parliament, the majority is his majority. It is hard-working because it works for him, and it is obedient because it obeys him. And he has not yet begun to touch the extreme edge of the great questions which he announced it was his special mission to handle and to shape. Hitherto he has had other things to think of. He has had foreign difficulties to settle; he has had overwhelming troubles in Ireland to encounter; and he had made up his mind to raise and dispose of a third pertinacious obstacle before he gets to the real business of his Ministry, and to obtain a House of Commons that will do his work quickly and sharply when he gives it the tasks it has to despatch. Were it only for this last duty his presence would be indispensable. To persuade the House of Commons to put itself in new fetters, and to abandon the traditions of

centuries of independence, would be an almost hopeless undertaking, unless Mr. GLADSTONE was there to give the prestige of his long Parliamentary life, to refine, to distinguish, and to overawe, and to draw upon the vast experience he gained when he too played with the weapons of obstruction.

A Cabinet Council is to be held next week; and Cabinet Councils, when they meet at this time of year, generally occupy themselves with what is to be the work of the coming Session. There are some pressing matters with which the Government must deal. There is the reform of Parliamentary procedure, which must take precedence of everything else. For Mr. GLADSTONE has announced that it is useless for him to propose any great measure until the House has made arrangements for allowing great measures to be carried through it with speed and certainty. Then there are some measures of great, but not capital, importance which are standing over from last Session, and which the Government can scarcely allow to stand over any longer. Unless Mr. BRADLAUGH is allowed to take the oath at the beginning of the Session, the Government must try to give him the measure of general relief which it has promised him. Troublesome as this BRADLAUGH business has been, the course of a Parliamentary Oaths Bill might give the Government less trouble than Bills that would provoke less excitement. In spite of Liberal abstentions, there would probably be a majority sufficient to get the Bill through the Commons; and then, if it were rejected in the Lords, the Ministry might accept its rejection with some display of stout language, but not without a sense of secret satisfaction. There are also remaining from last Session the Bankruptcy Bill and the Election Bill. It would be scandalous if Parliament allowed another Session to pass without something being done to abate the abuses of the present bankruptcy law; and the present House was tarred with enough electioneering pitch at its commencement to make it anxious to show a zeal for the purity of future Parliaments. Neither of these measures can be called a party measure. Conservatives are as desirous as Liberals that the law of bankruptcy should be put on a decent footing; and no Conservative would deny that, if elections can be made purer, they ought to be made purer. But it often happens that the measures most difficult to pass are the measures which do not belong exclusively to either party. The principles are admitted, but a stumbling-block is found in every detail. And measures like a Bankruptcy Bill and an Election Bill, if they do not excite the interest of parties, excite in an extraordinary way the interests of individual members. There is not a representative of a commercial town who would not have something special to say as to calamities in trade, and there is not a lawyer in the House who will not secretly plume himself on the facility with which he could pick a hundred holes in any Bankruptcy Bill which other lawyers have framed. Few members have not the light of a sad memory to guide them when responsibility for agency at elections is being discussed, and many have erring but zealous friends whose errors and whose zeal will move them to compassion when it is proposed to visit bribery with increased severity of punishment. Every one thinks he has a right to speak on questions which are not party questions, and of which he has a peculiar and personal knowledge. It will be interesting to observe how the House of Commons decides to deal with Bills of this class when its new Bills are proposed to it. It is one thing to decide that party measures supported by the whole force of a Government and a majority shall not be arrested by wanton obstruction. It is another thing to determine that there shall be artificial limits imposed on the discussions of measures in which numerous members take a keen personal interest, on which they have much to say, and which they seek to amend and not to kill. And yet it would seem that any rules that are accepted must be general, and that the sacrifice of free discussion to be effective must be wholesale.

Beyond these preliminary or minor measures, which would fully take up an ordinary Session, there are the great and vague undertakings which the Liberal party has set itself to accomplish. Of the many with the prospect of which Liberal electors were once dazzled, there appear to be now three which have finally commended themselves to the attention of the Liberal leaders. These are a County Government Bill, a County Franchise Bill, and an English and Scotch Land Bill. The time for a County Fran-

chise Bill has evidently not yet come; for the Parliament that passed it would kill itself, and, as Mr. FAWCETT pointed out at Hackney, the country has not begun to trouble itself in the least about it. Before the County Franchise Bill is brought forward, it is certainly desirable that some kind of preliminary discussion of its consequences should have been set on foot. A County Government Bill would not perhaps be open to this objection; but it would be open to the objection, equally grave, that it would at every stage raise the eternal Irish question in a new shape. As it seems to be part of the Liberal creed that every thing applied to England is to be applied to Ireland some day, a County Government Bill for England would virtually determine what form of Home Rule was to be bestowed on the Irish; and, if there is one thing for which Englishmen wish, it is to have a Session in which the Irish question may go as much to sleep as it ever can do. There remains the English and Scotch Land Bill; and it is not a very hazardous conjecture that this will be the choice of the Ministry. Although Parliament would have enough to occupy it without a Land Bill, it is very unlikely that Mr. GLADSTONE would be content to open the third Session of his Ministry without the announcement that he had taken in hand one, at least, of the great measures which were to mark his second tenure of office. The real difficulty of a Land Bill is to make it what would seem to any one, whether a partisan of Mr. GLADSTONE or not, a great measure. That a life-owner should have new powers of dealing with his estate, and that a tenant should be scorned against the confiscation of his legitimate investments, are salutary doctrines; but the former has already been put into shape by a Conservative Chancellor, and the latter is accepted by almost every Conservative member. In these directions there is little by which a Liberal Government can specially distinguish itself, or can awaken any ardent enthusiasm in its supporters. As to anything further, there are the barriers suggested by Mr. FAWCETT that freedom of contract is the first principle of Liberalism; that the good of the general public, and not the conflicting interests of classes, must be the test of a Land Bill; and that the taxpayer must not be called on to contribute towards setting up other people in a business artificially created for them. The curious public must wait to see how any land measure can be devised which will be in a Liberal sense great, and yet which will not offend against one or more of these excellent canons.

#### M. GAMBETTA AND THE CHAMBER.

NEXT to becoming a Minister, what M. GAMBETTA seems most to dislike is becoming a Minister in a commonplace way. In the natural course of things he would have remained a private deputy until such time as M. FERRY had resigned his office, and would then have been sent for by M. GRÉVY, and entrusted with the task of forming a Cabinet in which he would have taken whichever place he liked best. But M. GAMBETTA is of opinion that his dignity requires some exceptional humouring. It was needful that he should be marked out as M. FERRY's successor by something more than common report or the PRESIDENT's own observation. M. GRÉVY must receive a mandate of some sort which should serve as a formal declaration that M. GAMBETTA is the choice of the country, and not merely of the PRESIDENT of the REPUBLIC. To meet this necessity, the plan of electing M. GAMBETTA temporary President of the Chamber of Deputies was devised. There is nothing very dignified in this extremely provisional office; but the election to it enabled M. GAMBETTA's friends to say that the Chamber had pointed him out to M. GRÉVY as the leader of the majority, upon the command of which M. GAMBETTA has always insisted as a condition of taking office. The *République Française* accepted the vote as proving that in the new Chamber at least 350 recognize M. GAMBETTA's claims, while not more than 200 are opposed to them. By offering himself as a candidate M. GAMBETTA intended to give the majority an opportunity of expressing its policy, and of telling the country which elected it and the PRESIDENT who listens to it what programme it means to adopt. It has pronounced, it seems, in favour of a policy at once energetically and wisely progressive. It has made M. GAMBETTA its President for a week, and it has thus ranged itself on the side of radical but

prudent reform. The majority which has done all this may fairly be surprised at the wealth of meaning it has contrived to compress into a very simple act. As M. GAMBETTA had given out that he wished to be appointed temporary President of the Chamber, it was only natural that a majority which had been returned to give him a general support should offer him the post he desired. It was one of those cases in which, while refusal to do what was asked would have meant a great deal, readiness to do it really meant nothing. No one has ever supposed that the Extreme Left could beat M. GAMBETTA in a pitched battle; all that the Extreme Left itself contends is that M. GAMBETTA will find that his own majority will insist on his bringing forward measures not easily distinguishable from those which are demanded by the Radicals whom his organs so frankly abuse. Upon this, the only point really in dispute, M. GAMBETTA's election as provisional President leaves us just as ignorant as before. It may please his friends to assume that by voting for him last Saturday the new Chamber formally adopted his policy; but the step supplies no information as to which of M. GAMBETTA's policies the Chamber has adopted. According to a probable account, M. GAMBETTA did not resort to this scheme until he had tried to get himself indicated as the leader of the majority in another way. He wanted M. GRÉVY to overlook the fact that M. FERRY has up to this time neither resigned nor been defeated, and to write him a formal letter setting out his position as the one man in whom the country had confidence, and summoning him to assume the responsibilities which this position imposes upon him. M. GRÉVY, however, who has no love for unnecessary ceremonial, could not be brought to see that any such letter was wanted. His idea was that M. GAMBETTA should say plainly that he would accept office as soon as M. FERRY had vacated it, and that he himself should then request M. FERRY to leave the field clear for his successor. This, however, implied that M. GAMBETTA should take office just as anybody else might take it, which was exactly what M. GAMBETTA did not care to do. His object is to be marked off from the common herd of *Primo Ministers*; and, indeed, considering what *Primo Ministers* have lately been in France, it is hardly surprising that he should entertain this wish. M. GAMBETTA has so lowered the dignity of the office to suit his own convenience, that he is now ashamed to hold it unless he can make it assume an aspect different from that which it has worn in the hands of his puppets.

It is unfortunate that the prolonged Ministerial crisis under which France has been suffering should have coincided with the attempted renewal of the Commercial Treaty. International politics and international business are best kept apart, and in the recent negotiations the two have been lamentably intermingled. It has been contended, with much show of argument, that the true policy for this country is to keep the treaty on the stocks at any price. We have no wish to undervalue the importance of an arrangement to exempt England from the exceedingly vexatious tariff which it has pleased the French nation to impose upon its customers. But it is to be remembered that this arrangement, valuable as it may be, has never yet been reduced to shape, and that its provisions may be greatly affected by the position which this country now takes up in the controversy. A large and influential section of Frenchmen is thoroughly convinced that England is simply the fox that has lost its tail. We should abandon Free-trade if we could; but as circumstances are too strong for us, the only thing that is left for us to do is to induce other nations to step into the trap into which we ourselves have already fallen. This is not a theory which is likely to dispose the French to offer us specially favourable terms. Before they can accept freedom of trade as the end to which all commercial treaties point, they must satisfy themselves that England, at all events, believes in her own preaching. If there is any truth in economical theory, France will in the end be worse off under her new tariff than we shall be. This does not in the least conflict with the full recognition of the fact that under the French tariff England will be badly off. In modern trade it is impossible for one member to suffer even by its own fault without other members suffering also. But the essential thing to remember is that the country which imposes protective duties pays more dearly in the long run than the country which declines to be a party to them. No matter what the productive wealth of France may be, she cannot

for ever go on exporting goods after she has shut herself out from taking goods in return. In spite of occasional derangements, the balance of trade will in the end look after itself. In proportion as the decision of the English Government indicates a healthy belief in this elementary economical truth, it will be likely to weigh with the new French Ministry. Great hopes seem to be built in some quarters on the fact that M. ROUVIER, who is a Free Trader, will probably be the Minister of Commerce in M. GAMBETTA's Cabinet. It is doubtful, however, whether even a Ministry of Free Traders will be able to grant all the English demands. M. GAMBETTA may find himself strong enough in his seat to conclude a treaty which shall be really in advance of public opinion; but he may not care to provoke opposition upon a matter in which, as it is non-political, he cannot count upon the fidelity of his political friends. At all events, he will be in a better position to try the experiment if he can assure the Chamber that the English delegates have never retreated from the minimum which they first laid down, and that the only choices open to him were to conclude a treaty on those terms or to bring the negotiations to an end. If, on the other hand, Sir CHARLES DILKE returns to Paris with a weaker version of the English demands, the French Protectionists will be tempted to infer that a treaty of some kind is a matter of life or death to this country; and that, if they only hold out long enough, the English Government will be forced to make further concessions. As there is no reason to suppose that the English Government thinks any treaty better than none at all, this would be a very misleading opinion to get into circulation.

#### A LONDON MUNICIPALITY.

THE municipal incorporation of London is one of the many schemes of demolition and reconstruction which are contemplated by the present Government. Any institution on which Mr. GLADSTONE fixes his attention is in imminent danger of the fate which has befallen the Irish Church and the Irish landowners. If he finds time during his tenure of office to disestablish the City of London, he will be eagerly supported by his devoted majority, and perhaps by some of his more thoughtless opponents; yet it is strange that the vast population which is to be the subject of the proposed experiment neither complains of a grievance nor suggests a remedy. The agitation is promoted from without, and its motives are almost exclusively political. One of the innumerable clubs which are organized for special purposes of destruction has, under the title of the London Municipal Reform League, undertaken to conduct the agitation until it is taken in hand by the Government. A week ago the managers assembled a few hundreds of persons in the Holborn Town Hall to listen to speeches which can have been but moderately exciting. A portion of the audience may perhaps have consisted of ratepayers, mixed up for the occasion with miscellaneous idlers. The League secured in Sir ARTHUR HOBHOUSE a chairman respectable in position and ability, but a zealous and active political partisan. There were two members of Parliament—Mr. FIRTH, who is the official leader of the agitation, and Mr. ASHTON DILKE, principally known as a member of the most extreme or revolutionary section of the House of Commons. The inevitable Mr. JAMES BEAL and Sir J. BENNETT, who have reasons for disliking the Court of Aldermen, were the only other known attendants at the meeting. There is no reason to suppose that any of the speakers represented in the smallest degree the public opinion of any part of the metropolis. It may be added that, if any new illustration or argument was introduced, it has not been reported. Mr. FIRTH had heard that in certain houses there was insufficient drainage. Mr. BEAL once more propounded the ingenious fiction that the City would lose nothing by admitting the whole of London to a partnership in its revenues and privileges. That the citizens should decline to be cajoled by transparent fallacies is not surprising; but it might perhaps have been expected that the erection of a central municipality would excite a warmer interest in the outer districts. Sensible householders, if they ever think of the subject, perhaps reflect that, at the best, their local affairs would be administered by the same persons as at present, under the name of Committees of the Town Council, instead of Vestries. The evil of rendering their interests

absolutely subservient to political interests would be entirely novel.

Sir ARTHUR HOBHOUSE, with the easy indifference of a public speaker, persuaded himself for the occasion that municipal revolution was not a party question. "They all knew," he said, "the fatal tendency which demands for improvements had to sink into the groove of ordinary party politics. He trusted this would not be the case with this question. There was no reason why it should be. Surely a Conservative or Tory politician could demand an efficient government for London without any sacrifice of his principles." Sir ARTHUR HOBHOUSE would probably never have troubled himself with the question if he had not been a party candidate for a metropolitan constituency. He must be well aware that the Town Council or governing body would be elected by the ratepayers, without the slightest regard to administrative capacity, on the nomination of political managers. The Parliamentary representation of the metropolis sufficiently indicates the inevitable result. The cities of London and Westminster would elect Conservative Town Councillors, and the rest of the metropolis would give Sir ARTHUR HOBHOUSE's party an overwhelming majority. Mr. GLADSTONE boldly declared at the Guildhall that the provincial Corporations looked only to municipal interests, and were quite independent of party politics. It would be presumptuous, if not profane, to criticize anything which Mr. GLADSTONE may choose to say; but his followers, even if they are of the rank of Sir ARTHUR HOBHOUSE, are not entitled to the same immunity. The scandalous monopoly which Mr. CHAMBERLAIN and his friends have established at Birmingham ought to silence the advocates of a vast London municipality when they profess to believe that it would be independent of politics. The same results would follow from the same causes. At present the members of the Common Council and the Aldermen are, in almost all instances, elected without reference to their political opinions. The Vestries also represent local interests, and they in turn elect the Metropolitan Board of Works without inquiry into their political opinions.

Mr. BEAL's League probably still adheres to the outlines of an elaborate Bill drawn a year or two ago by some ambitious amateurs, of whom Mr. FIRTH was the only metropolitan member. A slight and significant indication of the nature of the Bill is furnished by the title, according to which it purports to create a Municipality of London. The word Corporation is shorter and more idiomatic, and it describes all existing municipal bodies in Great Britain; but Municipality is, for some unknown reason, thought to be a finer term. The simultaneous creation of a county of London was more conformable to precedent, though its practical object is not apparent. According to the Bill, forty municipal districts were each to elect six members of the Municipal Council, which might as well be called a Town Council, or a Common Council. The details of the project are not worth considering until it has been adopted by the Government. It may be hoped that Mr. GLADSTONE, if he introduces a serious measure, will not borrow from Mr. FIRTH the proposal of transferring to the new Corporation the control of the Metropolitan Police. It might be dangerous to give an independent potentate residing at the seat of government the command of a disciplined force of ten or twelve thousand men. The City Police, though it is well organized, is insignificant in numbers; while the Metropolitan Police obeys the orders of the Home Secretary, who appoints its officers. Several years have passed since the tranquillity of London has been seriously threatened by political agitation; but at the time of the Hyde Park disturbance much alarm would have been caused if the police had been at the disposal of a corporate body which might perhaps have sympathized with the rioters. The London police is now useful as a reserve to the county and borough police in all parts of the kingdom, and it is charged with the maintenance of order at popular resorts such as Epsom and Ascot. It would be a strange anomaly to allow such services to be regulated by the representatives of London ratepayers. In this, as in many other respects, the analogy of the provincial corporations is deceptive. Neither Liverpool nor Birmingham is the seat of government; and the largest Northern city contains only a sixth or an eighth part of the population of London. The Lord Mayor, who might be a demagogue, would be the local ruler of a

community equal in numbers to the inhabitants of Scotland.

The experiment of a single municipality has been tried in Paris and New York, which are, after London, the largest existing capitals. The Paris Municipality has promoted one sanguinary civil war, and it causes constant anxiety to the national Government. The democratic Corporation of New York carried corruption and embezzlement to a height which has never before or since been equalled. When the chief criminal was at last prosecuted, he lost none of his popularity with the Irish and indigenous rabble which had shared his ill-gotten gains. At this moment the municipal taxation of New York, imposed by a majority which pays no taxes, is almost intolerably oppressive. The local administration is as inefficient as it is costly. The discreditable proceedings of the Dublin Corporation within the last few days may convey a warning to party innovators. Dublin is, indeed, not unwieldy in size; but it is the seat of a provincial Government with which the Corporation has friendly or hostile relations. The infamous proposal to confer the freedom of the City on Mr. PARNELL would perhaps in any other case have been regarded by Mr. GLADSTONE as a proof of exemption from political influence. The resolution was only defeated by the casting vote of the MAYOR; and the opponents of the motion have since been subjected to the grossest indignities. If London really required municipal institutions, there is much to be said for Mr. MILL's plan of incorporating the Parliamentary boroughs. Several of them are as populous as the great provincial towns, and some of them have a kind of civil unity which is unknown to the metropolis at large. The measure would probably not be grand enough or sufficiently democratic to attract Mr. GLADSTONE's sympathy; but it would supply all the benefits of a single municipality, while it would be free from many objections to the larger scheme. Mr. FIRTH is naturally enamoured of his own proposal, and the greater part of his speech at the Holborn meeting was directed against the comparatively moderate proposal. It is not known in what order the disestablishment of the Corporation stands in Mr. GLADSTONE's list of urgent measures. The fate of the City may be postponed, but it will scarcely be averted.

#### THE AUSTRIAN RED BOOK.

THE Austrian Red Book, or Foreign Office Report, has excited some attention both in England and on the Continent, though the transactions which it records have been for some time completed. Baron HAYMERLE, who probably superintended the compilation of documents before his death, deserves credit for prudence and for courtesy in excluding the correspondence which related to Mr. GLADSTONE's wild denunciation of Austrian policy. The abject apology afterwards made to Count KAROLYI furnished an excuse or reason for suppressing one of the most singular episodes in modern diplomatic history. Probably the expression of Mr. GLADSTONE's passionate antipathies was not forgotten in the more practical discussion which followed. The Austrian Government unwillingly consented to join in the naval demonstration at Dulcigno; but when the most heroic race of moss-troopers in Europe had been placed in possession of the ceded territory, the avoidance of war seems to have been mainly owing to the resolute moderation of Baron HAYMERLE, who accurately represented the feelings and opinions of his countrymen both in Austria and in Hungary. Lord GRANVILLE proposed that Turkey should be forced into the surrender of Thessaly and of the greater part of Epirus by an occupation of Smyrna and by the sequestration of the Customs duties of the port. Russia, as in every other stage of the proceedings, cordially concurred in the policy of an ally who was serving Russian interests with unaccountable zeal. Prince BISMARCK apparently left the conduct of the negotiations to Baron HAYMERLE, who at last assented to the English proposal, though he declined to take part in an operation directly hostile to Turkey. The backwardness of Austria, and the ultimate opposition of France, fortunately prevailed over Mr. GLADSTONE's dangerous policy. The claims of Greece were afterwards partially satisfied as a result of peaceful negotiations, and the complete dissolution of Turkey was once more postponed. It appears from the Red Book that at the end of 1880 the Austrian Ambassador informed his

Government that the SULTAN seemed to be resolved on war. He may perhaps have calculated on the inevitable extension of the quarrel which Mr. GLADSTONE would willingly have fastened on Turkey alone.

In one of the most remarkable of the published despatches Lord GRANVILLE enunciates a sound proposition which his Government has on other occasions either forgotten or directly repudiated. He points to the lesson which, he says, is taught by history, that nothing is to be obtained from Turkey but by force or by threats of force. With a bolder generalization, he adds that "he does not believe in diplomatic action without coercion in reserve." No doctrine can be more entirely sound, or more utterly inconsistent with the principles and the practices of Mr. GLADSTONE and his colleagues. The range of diplomatic action must be narrowly restricted if it is only efficacious when five or six Great Powers are leagued against one adversary who is not a match for the weakest of their number. In less simple cases the English Government, not having coercion in reserve, has not attained great diplomatic success. During the rapid extension of Russian power to the borders of Afghanistan, it has been obvious to all the world that only one of the parties concerned has had coercion in reserve. In the same despatch, Lord GRANVILLE scarcely shows his usual respect for diplomatic propriety when he remarks that the present English Government did not invent any of the pending questions, but inherited them all. In dealing with foreign Powers, the English Government ought to assume its own continuous unity. It was not the business of Baron HAYMERLE to take official notice of the retirement of Lord BEACONSFIELD, or of the accession to office of his bitter enemy. The meaning of the phrase apparently is that the Berlin Treaty was concluded by the late Government, and that Mr. GLADSTONE and his colleagues had no choice but to execute the provisions of the treaty. The fallacy of the implied argument is sufficiently shown by the reluctance of Austria, France, and Germany to enforce the performance of stipulations to which, in common with England and Russia, they were parties. Mr. GLADSTONE himself only made naval demonstrations in support of those articles of the treaty which happened to command his sympathy. He used neither force nor rhetoric to secure to the Turkish Government the stipulated possession of the passes of the Balkan, or the virtual sovereignty of East Roumelia.

In some of his despatches Baron HAYMERLE adds the weight of his authority to the reasons which have been frequently urged against further aggression on Turkey. The Austrian Minister was well aware that the permanent maintenance of the Turkish Empire may prove impracticable; but he was not disposed to precipitate the catastrophe, and he could perhaps scarcely understand the sentimental hatred which Muhometanism produces in the minds of sympathizers with Oriental Christianity. As Baron HAYMERLE truly said, no European tribunal has yet declared what should occupy the vacancy to be caused by the disappearance of the Turkish Empire. It was perhaps a bold figure of speech to describe an Aroopagus, or as a court of justice, an assemblage of eager aspirants to participation in the division of the spoil. Mr. GLADSTONE, indeed, regards with impartial confidence and attachment the rival races on which he would willingly confer the coveted inheritance; but Baron HAYMERLE foresaw the contests which would ensue between Russians and Albanians, and between the Slavs and the Greeks. Conflicts of the kind would probably have broken out by this time if the unauthorized award of the Berlin Conference had been fully executed by the cession to Greece of Janina and of the neighbouring districts of Epirus. The English Government, after the success of the naval demonstration, relied on the plausible calculation that the same causes would elsewhere produce similar effects. The Turks had in the matter of Montenegro submitted to a threat of force, and it was possible that they might be still more effectually frightened by the occupation of Smyrna and the seizure of the Customs revenues. It was nevertheless necessary to consider the alternative. If the SULTAN had on such provocation declared war, it would have been necessary either that England should maintain the quarrel, or that reliance should be placed on the ready aid of Russia. Even in the enthusiasm of its early fondness for the new Government, the country would have been startled either by the prosecution of a war in which no English interest

was concerned, or by the encouragement of Russian designs for striking a final blow against Turkey. To a result which is, on the whole, satisfactory it appears that Austrian prudence largely contributed; but there is no reason to deny that Mr. GLADSTONE'S readiness, for once in his career, to second diplomacy by war had probably much influence in procuring the final cession of Thessaly by the Porte. The professions of moderation and universal good will with which he frequently garnishes his speeches are of more doubtful efficacy.

In diplomatic publications it is always possible that the most interesting matters may have been omitted. If it is true that a proposal made by Prince BISMARCK for an offensive and defensive alliance was declined by the English Government, there can be little doubt that Austria was a party to the overturo; but the negotiation must necessarily have been secret, if it is not to be regarded as apocryphal. Such an alliance would have been equivalent to a breach between England and a nearer neighbour, with whom it is more indispensable than with any other Power to maintain friendly relations. The silence of the Red Book on projects of aggression which have lately been attributed to Austria may perhaps be equally inconclusive. A meditated advance on Salonica would certainly not have been published for the information of friends and enemies. It was against such a project that Mr. GLADSTONE'S defiance was originally directed; but there is no reason to suppose that his discourteous cry of "hands off" in any way affected the policy of Austria. An anonymous writer, professing a knowledge of the secret policy of Europe, lately undertook to expose an elaborate scheme of Austrian aggrandizement which involved, as he suggested, political and commercial danger to England. That the possessor of Bosnia should hereafter seek access to the coast of the Ægean is not wholly improbable; but, when the occasion arose, the Austrian Government deprecated, and in great measure prevented, the territorial changes which might have facilitated the acquisition of Salonica. Even if the port were in possession of Austria, English commerce with the Levant and with India might perhaps continue to thrive. The scheme of an Austrian alliance with Greece for the purpose of excluding England from the Mediterranean is remote and not altogether intelligible. During the negotiations of last year it was England, and not Austria, which laboured to extend the boundaries of Greece. A long time must elapse, and many changes must take place, before Austria is in a position to compete with England in trade or in commercial shipping. According to the contention of the alarmists, encouragement of the trade of Salonica would be injurious or ruinous to England. The harbour is already there, but probably the Turks do little to profit by its local advantages. In Austrian hands it would perhaps flourish better; but it has not been the policy of England to discourage the formation or improvement of ports.

#### THE POPE AND THE ENGLISH GOVERNMENT.

THE meaning assigned to Mr. ERRINGTON'S visit to Rome is excellently calculated to set the more fanatical Protestantism of the country in a flame. It is rumoured that the Government are actually thinking of accrediting, though in an informal way, an English Minister to the Pope. It was bad enough that this should be done when the Pope was a secular prince; but even Exeter Hall could see that, so long as it pleased Providence to leave Antichrist in possession of certain temporal dominions, the fact had to be recognized, however repulsive it might be to pious minds. Now that the temporal sovereignty has been overthrown for more than ten years, and the Pope is universally recognized outside his own palace as neither more nor less than the chief of the Roman Catholic religion, the apparent compliment paid to that religion by accrediting a Minister to its head would be more significant, and consequently more irritating. Why, it will be said, should England have diplomatic relations with the chief of the Italian Roman Catholics, rather than with the chief, if there be one, of the American Baptists or of the Polish Jews? There is an obvious answer to this question; but as it is one the force of which cannot be appreciated without some slight share of common sense, it cannot be expected to carry conviction to Exeter Hall. The reason for maintaining an English Minister at Rome, supposing that one were maintained there, would be that the Pope exercises a

considerable authority over a large number of British subjects, including some of the most troublesome among the inhabitants of the United Kingdom. If any Protestant ecclesiastic, exercising as much authority over his spiritual flock as the Pope exercises over Roman Catholics, had some millions of adherents in Great Britain and Ireland, it would undoubtedly be expedient to keep a representative near him. The reason why we pass over the heads of every Protestant body abroad, and then begin to hesitate whether we ought not to resume diplomatic intercourse with the Pope, lies in the fact that foreign Protestant bodies are not eccumenical in their organization, whatever they may be in the names they give to their assemblies. To an American Baptist an English Baptist is nothing more than a foreigner who happens to hold a form of creed closely allied to his own. The two stand in a position of complete mutual independence. No authority is claimed on the one side, and no obedience rendered on the other. Where Roman Catholics are concerned the case is altogether different. The action of Englishmen professing that religion is influenced in a great number of ways by orders given and words uttered in an Italian palace. It does not matter a jot whether any of the ground outside that palace belongs to the ecclesiastic who issues these orders or speaks these words. His importance is not determined by the number of acres or square miles of which he is nominally sovereign. It depends upon the extent of his real sovereignty; and, in measuring this, the two things to be taken into account are the character of the spiritual influence he exerts and the number of persons over whom it is exercised.

From both these points of view the Pope is still a very great personage, and as such it might often be useful to the English Government to be able to communicate with him freely through properly accredited agents. When Belgium abolished the Legation at Rome, or when the French Left profess their desire to follow their neighbours' example, Englishmen can see that for a Government to deprive itself of any kind of information that may be useful to it is simply to spite itself. No matter what the vices of the Roman Catholic religion may be, it is still the religion of most Irishmen, of many Canadians, and of a considerable number of Englishmen and Scotchmen. With all these, the Pope's word has very great weight upon all subjects connected with religion. It is consequently of some moment that the English Government should know exactly what directions the Pope gives on these matters, and, still more, that it should be in a position to ensure that he does not speak without accurate knowledge of the facts to which his words relate. Very often, no doubt, the questions upon which the Pope is moved to address his spiritual subjects do not touch secular affairs. But occasionally they may touch them very closely, and exceptional occasions are precisely those to which diplomacy is intended to apply. The last twelve months in Ireland have been eminently a case in point. The Pope was anxious to know the meaning of the land agitation in Ireland, and he naturally looked for what he wanted to the Irish bishops in Rome. According to a contemporary, the result of their explanations was, as might have been expected, to give the Pope a very much more favourable opinion of the Land League and its doings than he would have formed if the evidence at his disposal had been less one-sided. But for a letter from Sir GEORGE BOWYER, declaring that, if Catholicism became associated with the outrages that were being committed in Ireland, English public opinion would become as anti-Papal as it was fifty years ago, he might have remained undisturbed in this conviction. If we had had a representative at the Vatican, the Pope would not have had to depend for accurate news about the state of Ireland upon a chance letter addressed to one of his attendants. The Minister would have taken care to keep the Pope thoroughly informed as to the relations of the Land League with the Government and the people, and the Pope would have known to whom to address himself if at any time he wanted further explanations.

Advantageous as diplomatic intercourse with the Vatican might have proved from the point of view of the pacification of Ireland, it does not follow that the benefits in question still admit of being realized. When diplomatic intercourse has long been suspended, its renewal will naturally be read in the light of contemporary politics. It will be argued that the object of the English Government is not to keep the Pope acquainted with the general course

of English affairs, but to come to an understanding with him on the specific controversy in which the Irish Roman Catholic clergy have taken so prominent a part. It would be useless to deny the *a priori* advantages of coming to such an understanding. If by so doing we could dissociate the Irish bishops and priests from the agrarian conspiracy, we should at all events have deprived our adversary of a very powerful ally. It is very doubtful, however, whether at this particular juncture the re-establishment of diplomatic relations with the Vatican would not have the very opposite results to those looked for. The Roman Catholic bishops have discovered, as it was all along certain that they must discover, that the orders of the Land League directly contradict the Ten Commandments. They were quite ready to give their approval to the cry of Fair Rents, but they are not willing to see that cry develop into one of No Rents. If this unwillingness were likely to be confirmed and strengthened by the establishment of more intimate relations between the Pope and the English Government, it might be well worth the while of the Government to try the experiment. Though the influence of the Roman Catholic clergy is not what it once was in Ireland, and though its weakness in this particular matter has repeatedly been proved, it is still a very considerable addition to the side with which it allies itself. Now for the first time it is showing some inclination to ally itself with the friends of honesty and public tranquillity. But nothing would be so likely to check any such inclination on the part of the Roman Catholic clergy as the knowledge that it would be set down by their flocks to the receipt of orders from Rome to back up the English Government. Nothing would be so certain to make the clergy hated in Ireland, and consequently nothing would be so likely to set them upon evading obedience by every means in their power. If there is any value to the English Government in the opposition of the Irish bishops and priests to the recent policy of the Land League, this value will be altogether destroyed if it can be said with any show of truth that they are condemning this policy, not because it is contrary to good morals, but because they have been bidden to condemn it by a Pope who wants to obtain the favour of the English Government. The support of the Roman Catholic clergy at this crisis will be worthless if it is not spontaneous, and nothing would discredit its spontaneity so much as a renewal of diplomatic relations between England and the Pope. It may possibly be a wise step to take by and by, when Ireland is quiet; it cannot be a wise step to take now, when Ireland is disturbed.

#### OFFENDING CHILDREN.

THE HOME SECRETARY has turned aside for a moment from the congenial jokes of political strife to the dreary realities which specially belong to the department with which he is accidentally associated. In opening a new Industrial School at Cockermonth Sir WILLIAM HARCOURT spoke his mind about a class of offenders which the increasing tenderness of public opinion makes it daily more difficult to deal with. The fashionable theory for some time past has been that children can do no wrong. They do things which would be wrong in other people, but they are not to blame for doing them. They may destroy property or endanger life; they may pull up flowers, break windows, or stick lighted matches into haystacks; they may throw stones at passing trains, or place any iron bars that they find lying about across a line of railway; but it is not their fault. If their parents are living, it is they who are morally responsible for their children's errors. If their parents are dead, it is unreasonable to expect orphans to be any better than they should be. It is no wonder that this state of things should drive magistrates to despair. If they let an offending child go, they have an unpleasant consciousness that his exploits will evoke a host of imitators. If they send him to prison, they are not at all sure that he will not come out worse than he went in—not to mention the probability that the sentence will be remitted by the Home Secretary almost before the local newspapers have had time to denounce the unpaid justices for passing it. Sir WILLIAM HARCOURT is bound to do something towards amending this state of things, and it is to be hoped that the Cumberland magistrates went home a little happier than they

came out. He could only, it is true, indicate the changes which he would have liked to make this year; but, as they are also the changes which he proposes to make next year provided only that he can find time, a sanguine country gentleman may easily persuade himself that the worst is over, and that by next August at latest he will have the means of dealing to some purpose with offenders even of the tenderest age. Weak as this ground of confidence may be, it is more trustworthy than the statistics by which the HOME SECRETARY sought to make out that juvenile crime is decreasing. It may readily be believed that the number of children under fourteen years of age who are daily returned to the Home Office as being inmates of prisons is very much less than it was. Nowadays a magistrate who has any regard for his own comfort will take very good care not to send a child under fourteen to prison. Even he, however, may not think the offence deserving of five years' detention in a reformatory, and, as there is virtually no third alternative, he probably dismisses the boy with a reprimand which is scarcely to be distinguished from an intimation to all whom it may concern that, if they choose to do likewise, they may do so with entire impunity. This is the state of things which Sir WILLIAM HARCOURT oddly described as one of which there is now "very little practically to complain."

Fortunately, though the HOME SECRETARY thinks there is little to find fault with in a system which leaves children to do pretty much what they please, he is willing to put even that little straight. The changes in the law which he has undertaken to introduce would undoubtedly effect a very real improvement in the existing methods of dealing with mischievous children. He proposes, in the first place, to give magistrates the power of locking up a boy for twenty-four hours and giving him a sound whipping. If the tender-hearted philanthropists who hold that there is something essentially degrading in the contact with a birch rod will allow this punishment to be inflicted, it will go a long way to improving matters. Most boys are fond enough of mischief to do it, if they are not afraid of the consequences. As it is, the nominal consequences are so severe that they are very seldom realized. A boy knows that those of his companions who have been carried before the magistrates for some act of unprovoked mischief have come back no worse off than they went, and he naturally draws the moral that he may give himself the same amusement, with no undue anxiety as to the result. It will be different if, between the departure to court and the return, twenty-four hours' confinement and a sound whipping has been interposed. There is no reason why a penalty of this nature and amount should not be inflicted impartially upon every offender; and, by the time this has been done for a year or two, the enjoyment of doing mischief will probably be very much lessened. In towns, at all events, a few cells might be attached to the Police Courts, and in them a boy who had been sentenced to be whipped might compare in solitude the pain of the stripes with the pleasure for which the stripes had been incurred. In the case of older boys, however, a somewhat longer sentence than twenty-four hours might have to be passed, and then another of Sir WILLIAM HARCOURT's suggestions might usefully be adopted. There are degrees even in childish offences, and if a week or a month passed under pretty sharp discipline would be sufficient to make a boy careful not to offend again, it is plainly bad economy to send him to a reformatory for five years. What seems to be wanted is a kind of correctional ward, which for convenience sake might be attached either to a reformatory or to an industrial school, but which, except locally, should not form part of either. To these wards children might be sent for short terms without any risk of being demoralized by contact with older offenders, and without incurring the specific disgrace which belongs to imprisonment. In this, as in many other instances, the deterrent effect of punishment lies mainly in its certainty, and nothing does more to diminish certainty than a want of proportion between the offence and the penalty. So long as a judge must make his choice between two inappropriate sentences—one which is in excess of what the case demands and one which falls short of it—the prisoner may always hope that he will get less than he deserves rather than more. Of course if sentences of detention for short periods in correctional wards are to become the rule in dealing with childish offenders, the provision of these wards must not be left to chance. They must be built in sufficient numbers, at the

cost of the community. It would probably be found expedient for the central Government to take the burden upon itself, and thus to insure that uniformity of management and discipline which has been introduced, with such excellent results, into the county gaols.

Still, when all these improvements have been effected, there will remain offences which can hardly be visited with any justice upon the actual offender. It is easy, no doubt, to exaggerate the amount of responsibility which parents ought to bear for the acts of their children. The father is usually at work all day; and, if the mother is also at work, the children may be little better than orphans. Among the very poor personal care of children is a luxury which they can seldom afford. The utmost that both parents can do is to support the family by their united labour, and before the paramount necessity of keeping body and soul together all other considerations disappear. There are other cases, however, in which the children's faults may plainly be traced to the carelessness of the parents; and when these faults assume a form of which the law is obliged to take cognizance, it is the parent, not the child, that ought to be punished. It would hardly be expedient to extend this principle to cases in which the offender must suffer in person; but it should be universally applied wherever the penalty is a fine. A fine imposed on a child is necessarily paid by the parent if it is paid at all; while, if it is not paid, the alternative imprisonment is borne by the child. There is thus a very great inequality in the treatment of childish offences, according as those who commit them are the children of very poor or of moderately well-to-do parents. Sir WILLIAM MARSHALL proposes to remedy this by imposing the fines directly upon the parent, and taking power to levy them on his goods. Offences which are not serious enough to condemn those guilty of them to a long period of detention in a reformatory school will thus be divided, according to their degree of heinousness, into those which touch the parent's pocket and those which touch the child's person. This would certainly be a very great improvement upon the existing classification.

#### THE COUNTRY OF THE GUNPOWDER PLOT.

A FINE old timbered farmhouse standing close by the churchyard in the pretty Warwickshire village of Dunchurch is still known in local tradition as Guy Fawkes's house. It was here that Catesby and his associates had arranged to meet before the hunt which was to be the pretext for their gathering, and hither the leaders hastened on the news of Fawkes's arrest, to be deserted by all but those who were too deeply involved to hope for mercy. The village, a famous posting-station in the old days, stands on the high road between London and Birmingham, on the brow of a line of low hills. Raines Brook, which here forms the boundary of Warwickshire and Northamptonshire, winds along the valley below to join the Leam between Wolscote and Kyles Hardwick. In the opposite direction, towards Coventry and Birmingham, the road runs for nearly three miles through an avenue of magnificent Scotch firs, and where these end they are succeeded by elms which carry on the line for some two or three miles more. The road here passes by Dunsmore Heath, where the great hunt to which Digby invited the conspirators was to have taken place. It was then a wild expanse of moorland, and in Dugdale's time it was still, he tells us, "a den of thieves and manslayers, by whom the road from Coventry to Dunchurch was much infested." Dunchurch itself is the model of an English village; many of the houses and cottages are both old and beautiful, and the more modern buildings, if they do not add to the picturesque effect, are not for the most part of such a character as to interfere with it. Roses grow luxuriantly on the clay soil, and in summer many cottages are completely covered with blossoms. The church, like many others in Warwickshire, is of red sandstone. The tower, which is finely proportioned, has a turret in one corner, and slightly resembles the tower of New College, Oxford, though it is on a far smaller scale. The outside of the church is still beautiful, in spite of the modern addition of a vestry; but in the interior paint and plaster have done their worst. In the middle of the village stands the market cross, flanked by the stocks which still remain as a terror to evildoers, though the children commonly use them for a vaulting horse, just as birds have been known to build their nests in scarecrows. The principal inn is named after the legendary Dun Cow of Warwick; but of course this legend has no connexion with the name of the parish itself, which is of very much earlier origin, and is derived from the hill upon which the village stands. The greater part of Dunchurch, as well as of the adjoining parish of Bilton, was granted in Stephen's reign to the monastery of Pipewell, in Northamptonshire, and the Grange stood on the boundary between the two parishes. Its site is now occupied by a fine house in the Tudor style, built by Pugin for the Roman Catholic family who were until lately the owners of

the estate. The name Bilton Grange is still retained. Bilton Hall, a beautiful old house surrounded by tall elms, is interesting as having belonged to Addison, who occasionally lived there. His only daughter succeeded him, and died at the Hall in 1797. She must then have been nearly, if not quite, eighty years old, for her father died in 1719, after a married life of barely three years. The village, though smaller than Dunchurch, is perhaps even more picturesque. It is not situated on any great thoroughfare, and so has a more secluded air. It is also comparatively free from the hordes of bicyclists from Coventry, who, tempted by ten or twelve miles of level road, make Dunchurch hideous with dust and shouting on every fine Sunday in the year. The lanes have broad margins of grass which no encroaching landowner has enclosed, and a pleasant sense of ease and leisure pervades the whole place. The country round, though not so rich in beautiful scenery as the more westerly parts of Warwickshire, will still better please those who admire above all things an extensive view. From the tower at Dunchurch one can see for miles across the rich pasture lands of Northamptonshire, dotted here and there with spinneys and gorse coverts. In this direction lies all the best part of the famous Pycheley country, and the meets at Lilbourne, Crick, and Yelvertoft draw together fields numbering many hundred horsemen. But the absence of large woods, however well it may fulfil the requirements of fox-hunting, gives a certain monotony to the scenery, and the eye turns gladly southward towards the mass of dark foliage which clothes the high ground at Shuckburgh. To the west the view is less uniform. There is more ploughed land, and therefore greater variety of colour. Woods, too, are larger and more numerous. About a mile away on this side is the beautiful park of Causton, with its broad belt of fine old trees, and the pretty cottage which does duty as the Hall. To the south-west lie Frankton Wood, and the larger masses of trees which occur at intervals between Frankton and Stoneligh. Beyond is the valley of the Avon, which contains, just in this part of its course, perhaps a greater number of picturesque water-mills than any equal extent of river elsewhere in England. The brooks winding slowly through the low-lying lands on their way to join the Avon are thickly fringed with reeds and bulrushes, and here and there a piece of marshy ground has been turned to good account as an osier-bed. Brown water-rats swim quickly to and fro across the stream, or sit on the broad leaves and gnaw the succulent stems of the river plants; shy moorhens rush to the shelter of the bank where some bush overhangs the water, as one passes not quite noiselessly by; and sometimes two or three wild duck, startled by the slightest sound, rise with much splashing from a quiet pool among the reeds.

The neighbourhood of Dunchurch abounds with memories of the old coaching days. Outside the village, on a road which joins the highway to Coventry with Watling Street, is the old "Cock Robin" inn. It is now converted into cottages, but the solid walls and high-pitched roof remain. Still more famous is the "Blue Boar," now a farmhouse, which stands on the Coventry road itself, about two miles west of Dunchurch. From this point we go on by lanes and bridle-roads past Wolston and Brandon to Combe Abbey, where the Princess Elizabeth was living under the care of Lord Harrington at the time of the Gunpowder Plot. Lingard states that, when the news of Fawkes's arrest was brought to Dunchurch, the conspirators abandoned their design of seizing the Princess, and proceeded at once on their desperate march into Worcestershire. This view, however, is contradicted by the annals of Coventry, which state that the attempt was only foiled by Lord Harrington's foresight in conveying his ward within the walls of the city, and keeping her there until the danger was over. This statement is confirmed by a contemporary authority whom Lingard and other writers seem to have overlooked. Within a few weeks from the discovery of the plot, John Barclay, a Scotchman, the author of the *Argenis* and of several polemical works, wrote a pamphlet entitled *Series patefacti divinitus parvulidii in ter Maximam Regem regnumque Britannia cogitati et instructi*. The pamphlet is interesting in more ways than one; but the passage which chiefly concerns us at present is the following:—"Generosos aliquot nobilissimi Harringtonii equos raperant, fures magis quam hostes. Et pene paritidarum consilium palam erat, voluisse sublato Rege et confusis miserabili calanditate omnibus, Serenissimam Elizabetham Regis filiam, quæ Burlii educabatur, in potestate sua esse, eam deinde collocari nuptui, prout rerum status et vel exterorum exigeret favor, vel metus urgeret. Sed populus ab eorum sceleris avaritia, quocunque se contulerant aut oppidorum aditu prohibebant, aut etiam infestis armis abeuntes prosequabantur." The first sentence certainly implies that a raid was actually made upon Combe, and Coventry was no doubt one of the towns which refused to admit the insurgents. "Burlii" must be a misprint for "Binlii," as Combe is in the parish of Binley, and the village is just outside the park. The abbey was founded in the reign of Stephen for Cistercian monks, and its estates were granted by Edward VI. to the Earl of Warwick. Upon his execution they reverted to the Crown, and were afterwards granted to Robert Kelway, whose daughter married Sir John Harrington. Harrington was one of the first barons created by James I., and was entrusted, as we have seen, with the education of the Princess Elizabeth, whom he accompanied abroad on her marriage with the Elector Palatine. About the year 1617, the Combe estate changed hands once more, being bought by the executors of Sir William Craven, Lord Mayor of London in 1610. His heir was created baron in 1627, and became Viscount Uxington and Earl

of Craven fourteen years later. The estate has remained in the family ever since. The late Earl spent the last years of his life in building a magnificent new wing to the abbey; but the work was left unfinished at his death, and has not since been continued. It is in the purest Gothic style, and is characterized by a rich profusion of material and a careful execution of the minutest details which have not been too common in modern reproductions of ancient styles. Of the monastery itself nothing but a part of the cloisters remains. The abbey contains some fine pictures, chiefly of the Dutch and Flemish schools, including several very good Vandykes. Beyond their intrinsic merits, the greater number of the pictures are interesting as having belonged to Elizabeth of Bohemia. The first Earl of Craven came under her notice when fighting in the Netherlands in the army of Prince Henry of Orange. She conceived a great regard for him, and, at her death, left him her books, papers, and pictures, thus renewing her early associations with the place where she had been brought up.

The place most closely connected with the history of the Gunpowder Plot is the manor-house of Ashby St. Ledgers, in Northamptonshire, which was then the principal seat of the Catesby family. It lies about six miles south-east of Dunchurch, near Crick railway-station. The estate came by marriage into the possession of John Catesby at the beginning of the reign of Richard II. The family escaped extermination in the Wars of the Roses, and the founder's grandson, Sir William Catesby—the "cat" of the familiar couplet—died at Bosworth fighting for Richard III. He was attainted after his death; but the attainder was reversed, and his estates were restored to his heirs in 1495. Sir William, the representative of the family in Elizabeth's reign, adhered to the Romish faith, and was concerned in the attempted rising under the Earl of Essex. However, he contrived to hand down his estates to his son Robert. Ashby St. Ledgers was by no means the only estate owned by the Catesbys in the midland counties. Their name is preserved in the little village of Catesby, which lies just within the borders of Northamptonshire, a few miles south-west of Daventry; and among other manors which were at one time or another in the possession of the family was that of Lapworth, in the west of Warwickshire, which was sold to Sir Edward Greville by this very Robert, no doubt to defray the expenses of the plot. When the "plans plumbæ," of which John Barclay speaks so exultingly, had done its work, the Catesby estates of course escheated to the Crown, and after several changes of ownership Ashby St. Ledgers was sold to John Ashley, in whose family it remained until the close of the eighteenth century. The house is a fine old gabled building; but it has been added to and altered from time to time until it presents a somewhat nondescript appearance. The most interesting feature of the place is a small chamber with a bay window, which is built over an old gateway separating the house from the church. Here local tradition says that Catesby used to meet the other leading conspirators and confer with them about their plans. Perhaps he sometimes pictured himself the Minister of a Catholic king of England. At any rate, we may be sure that he did not anticipate the argument against his chances of success which is thus quaintly expressed in Barclay's hexameters:—

Quid perfida tela  
Abdere, quid tanto componere sulphure fulmen,  
Quid juxta occultis tot semina condere flammæ?  
Ah miser! prohibere minas. Sua numina novit  
Fulmen, et in magnum nescit peccare tonantem.

#### DE LUNATICO INQUIRENDO.

THE Home Secretary has presented himself to the country in the light of an inspector of lunacy. Sir Stafford Northcote, it appears, had talked of the madness of the people, and Sir William Harcourt was particularly anxious to know what a lunatic people are like. So he went to stay with Sir Wilfrid Lawson, and Sir Wilfrid and his guest went down to Workington last Monday. On the previous Saturday at Cocker-mouth the Home Secretary had been non-political; but apparently lunatics do not understand this attitude. On the same day he had been highly complimentary to Mr. Percy Wyndham; but it seems that lunatics do not understand this kind of compliment either. Sir Wilfrid is a very stark man, and he in his turn does not understand guests who refuse to play the game; so a field day had to be arranged at Workington, and the two celebrated jesters journeyed thither. The incidents of the journey are not recorded, but any one who appreciates the character of the two speakers will at once understand the situation. There is a picture in *Mrs. Perkins's Ball* which represents the probable attitude of the two to the life. "Jack Hubbard, that merry rogue," is meditating an impromptu, and, according to Thackeray, meditating at the same time on the bill which comes due next Thursday. It is not at all likely that Sir Wilfrid Lawson and Sir William Harcourt meditated on any such subject as the latter; but they must have been sorely exercised as to the jokes which each was going to lay before the intelligent Workingtonians. A great responsibility lay on each. Our contemporary the *Spectator* has decided that, except when the Home Secretary opens his mouth, *à présent c'est bien fini de rire*. "You know how hard I am to move," as Smollett's hero remarked; and it is no light thing to feel charged with the function of making some persons merry. On the other hand, Sir Wilfrid Lawson is to the world in general even more

important than the Home Secretary as a living, walking, and speaking proof that Radicalism is not necessarily destructive of the merriment of England. Both of these merry men have been somewhat under a cloud of late. The wheels of their chariots have somehow been taken off, and they drive them with exceeding heaviness. They "jock wi' deeficulty," obviously owing to the fact that all the people round them are utterly unable to jock at all. Too great a sense of responsibility has been known in various relations of life to be fatal to the otherwise undoubted powers of the responsible person. An ordinary speaker can get out a printed abstract of his speech beforehand, with "cheers" marked in brackets at the proper places. But the laughing muscles of humanity are remarkably obdurate. Even a West Cumbrian cannot laugh at an impromptu unless it has at least the appearance of being an impromptu, and so this resource was closed to the two champions who went down to Workington on Monday to prove by jests that Radicalism is the only God and that Mr. Gladstone is his prophet.

It can hardly surprise any one to find that the Home Secretary came out of the valley of the shadow of heavy jokes, on the whole, the best. Everybody knows the proverb about "Tell me whom you live with"; and Sir William Harcourt has, on the whole, the advantage of his host in point of association. No one can have with impunity the United Kingdom Alliance perpetually around him. Sir Wilfrid Lawson's wit confined itself to such remarks as that Sir William Harcourt was "a big 'un," that the air was "heavy with Lowthers," that Mr. Percy Wyndham was "a crafty old fox," and that Mr. Cavendish Bentinck's Christian names were George Augustus. The Workingtonians cheered, which was amiable of them, and Sir Wilfrid was doubtless satisfied. Fortunately or unfortunately for the Home Secretary, he has not as yet made his home with Mr. Dawson Burns. An uneasy sense that the ears of Europe—and of our contemporary before mentioned—are upon him is often discernible in Sir William Harcourt's eloquence nowadays. He seems to have passed his jokes through a process of self-criticism, and not to be satisfied with them. "It was not thus" (one fancies him meditating) "that I joked when I was not convinced that Mr. Gladstone was the crown and flower of humanity." So the Home Secretary began his inspection of the lunacy of West Cumberland by a *plea ad misericordiam*. He had a cold, and the trains were late. "The boy on his right"—that is to say, Sir Wilfrid—would joke for them. He (Sir William) was but a secondary performer. This, it is true, was only a preliminary canter. The relentless trainers and jockeys who had got hold of Sir William Harcourt were determined to have a real run out of him for their money, and a run they had. The Home Secretary began by comparing West Cumberland to Cyprus, and his ingenuity does not seem to have quite sufficed to persuade his hearers that this was a compliment. For, according to Sir William Harcourt, Cyprus is about the least respectable part, and still more, the least profitable part, of the British dominions, and the West Cumbrians oddly enough seem not altogether to have appreciated the comparison. Even after this brilliant paradox, the Home Secretary made a vain effort to throw up the sponge, saying that "the public had had as much speaking lately as it knew what to do with." It was no good; he had to go on. So he told the West Cumbrians (as a private confidence never yet vouchsafed to any audience except themselves) that "London was not the nation." This was cheered, and it seems to have inspired him with what was perhaps his happiest thought. "The late Government," he said, "fancied that they had discovered the elixir of political life." The phrase is not bad; but are there no other Governments which seem to have the same fancy? "The verdict of the country," said Sir William Harcourt, growing bolder as he went on, "is not unfavourable to Mr. Gladstone." This was on the 31st of October, and the Home Secretary thought that his greatness was ripe. Next day there came a killing frost, and, somehow or other, the newspapers which since 1877, or thereabouts, have had enthusiastic articles on the lessons of the municipal elections, passed them over without so much as a notice. However, it may be admitted that the Home Secretary could not know this. A more remarkable statement followed. "The history of England for the last fifty years," said the speaker, "had been the history of the Liberal party, and for the last five-and-twenty it had been the history of the genius and character of Mr. Gladstone." It is pleasant to think what Englishmen of old would have said if they had been told that the history of their country was nothing but the history of a single man. The idle mind seems somehow to hear some far-off echoes of what was said two years ago about personal government, till it remembers that an unfortunate statesman with a bad cold and an inexorable host waiting to cap all his best things is not to be judged too hardly. As usual, time's noblest offspring was his last. Sir William—cold and host notwithstanding—had a "crusher" for the finale. If the policy of his party, he said, was as bad as it had been represented, how was it that in the last fifty years England had not been utterly undone? Sir William seems to have an inadequate idea of the powers of his own party. The caudex of fifteen hundred years cannot be destroyed in fifty even by the genius and character of Mr. Gladstone, though fairness obliges us to admit that the genius and character of Mr. Gladstone have done a surprising amount of work in that direction. After this the seventh age of Sir William Harcourt's eloquence was too much like the Shakspearian description to be dwelt upon. The Ground Game Act—"My little Bill, sir"—was

the evidence produced to prove the genius and character of Mr. Gladstone's Government, and the Home Secretary remarked that "No man can contract himself out of it." Sir William Harcourt is a lawyer, and has filled responsible positions in the legal hierarchy. But if he will apply to any ordinary solicitor or barrister, he will hear of a very simple plan for contracting himself, or anybody else, out of his favourite Act, which, to use the words of a competent witness, is "polishing hares off the face of the earth," and which only spares deer because (as Mr. Labouchere knows) they are "winged game," and therefore exempt from its provisions.

It is impossible for any generous person to read these speeches without a profound sense of sadness. Miltonic, Virgilian, and Tennysonian reminiscences crowd upon the mind, and generally embody themselves in a *quantum mulatus ab illo*. The quotation does not apply to Sir Wilfrid Lawson, who was heavyish at his best. But there was a time when Sir William Harcourt did not hold quite the same opinion about the genius and character of Mr. Gladstone, and when he had no need to plead colds and the lateness of trains. The Workington speeches make one think of that uncomfortable poem, *The Last Tournament*. The speakers are not broken in the orthodox manner, and, unfortunately, outside the lists there are competitors in the unorthodox manner who must make the veteran jousts a little uncomfortable. When political argument resolves itself into talking about "the air being heavy with Lowthers," and "Lowthers disappearing fast from civilized society," and "George Augustus Cavendish Bentincks," and suchlike things, one somehow turns from Workington to Hull, from the setting to the rising stars of this firmament. If this sort of personality is to be the political argument of the future, Lord Randolph Churchill can give points to the Home Secretary and to Sir Wilfrid Lawson. He carries his audience more thoroughly along with him; he has higher game to fly at (for the Radical "Jockers," on the whole, treat the leaders of their opponents not indeed with respect, but with a kind of distant semblance of it, which seems to imply more of fear than anything else), and he is not burdened with any traditions of a different style of warfare. Sir William Harcourt and his friends set the example of an entirely new kind of fighting in their 1879-80 campaign. We shall not say, as an outspoken partisan has lately said, that the fight was won by "hard lying"; but it was certainly won by hard language. Now hard language is at the disposal of any one who has a lively tongue, a certain amount of brains, and a determination to win without too much scrupulousness about the means of winning. The strong man, in point of Billingsgate, only keeps his house until a stronger and younger than he comes and casts him out. It is much more comely, no doubt, to confine the combat to rapier thrust and parry; but if a worsted combatant takes to catching up stones and mud, and flinging them at his opponents, he must not complain if stones and mud are flung back. We prefer the rapier; but that is a matter of individual predilection. To judge the latest interchange of the coarser weapons, impartially and by results, it must be decided, on the whole, that the juniors have it; and the most reasonable moral on the whole matter is "Vous l'avez voulu." Much allowance must of course be made for the natural incapacity of Gladstonians pure and simple to make a joke. Perhaps when Liberalism has emancipated itself from its temporary prison and has returned to a freer air, it may be possible to find champions who can jest. At present such champions are old hands of very doubtful orthodoxy, whose neo-orthodox fervour seems somehow or other to have decidedly interfered with their faculty of joking. They are conscious of the fact, and have become abusive instead of jocular, and now they cry aloud to earth and heaven because controlment is met with controlment. We are not much enamoured of the response, but it is just as well to remember who gave the challenge.

#### THE ORDER OF CORPORATE REUNION.

OUR readers may recollect our calling attention four years ago to the foundation of the mysterious Society which rejoices in the sonorous designation of the "Order of Corporate Reunion." A "Pastoral" had then just been issued by the three nameless hierarchs who under such lofty titles as "Bishop of Oerleon," and "Provincial" of—we forget exactly what—had assumed the leadership of the new communion. It was darkly intimated that those prelates whose new-fledged splendours were thus suddenly flashed on the world had secured somehow or other an episcopal succession which combined the lines of all the great historical Churches in East and West; but all particulars of name, place, and other detailed circumstances, were carefully suppressed. The obedience of the faithful throughout the Anglican communion was challenged for sees of more ancient date and claiming a more legitimate jurisdiction than Canterbury or York, although the first question likely to be asked by those inclined to respond to the call—as to the antecedents and position of the unnamed personages who arrogated to themselves these august prerogatives—remained unanswered: It was only natural in the absence of authentic information that various reports should circulate as to who these new Bishops and Provincials really were. That they were to be found among the clergy of the Established Church was plainly implied. And it soon began to be vaguely rumoured that Mr. A. had been seen in a purple cassock, and Dr. B. wearing an episcopal ring, or that the Vicar of C. was observed to pronounce the Benediction with

three fingers extended and "processed" about his church with "a fine pontifical strut." It was confidently asserted in some quarters that at least two hundred incumbents had joined the nascent community, and that there was no English diocese where it did not find representatives. And then there was mention made from time to time, in newspaper paragraphs ostensibly inspired but solemnly obscure, of Chapters or Synods, and occasionally scraps of liturgical or ritual offices published by authority found their way into the columns of these newspapers. One or two numbers also appeared at long intervals of the *Reunion Magazine*, which communicated from headquarters such fragments of information as the public were deemed worthy to receive. But a heavy veil still hung over the portals of this Church of the Future, which may perhaps have been withdrawn, or partially withdrawn, for the initiated few who sought entrance to its sacred precincts, but was impervious to the outer world. Rumour in such cases is sure to be busy—*facta, infecta refert*—and how much or how little credit should attach to these floating stories or surmises nobody could pretend to determine. At length, however, a writer, who is avowedly a member and presumably an authority of the newly-established Church, has come forward to lift the veil. In the October number of the *Nineteenth Century* Dr. F. G. Lee undertakes to instruct the general public on the nature and objects of this "first open and systematic attempt to face bravely the dangers and difficulties of divisions," which, as he tells us, "was founded quite recently, on the 8th of September, 1877." To be sure his revelation is quite as remarkable for what it omits as for what it contains, and we are left after all very much in the dark on certain points as to which one might suppose that any one anxious to find refuge for his soul in this new ark of safety would first of all require to be satisfied. However, we must be thankful for small mercies, and be content to make the most of the modicum of enlightenment vouchsafed to us.

The reasons for founding the new Order are thus stated by Dr. Lee, whose words shall be given as they stand to avoid any risk of misapprehension. It will be observed that in a general way they correspond with the causes usually assigned for the origin of the Tractarian movement in 1833. In either case dangers and abuses in the English Church were alleged which called for strenuous action on the part of her ministers and adherents, but whereas the Tractarians aspired to reform abuses through the use and development of the existing machinery, the "O. C. R."—so far as we can gather—offers an entirely new and independent machinery for the purpose. But that will appear more clearly by and by. Dr. Lee thus expounds the *raison d'être* of his new community:—

The origin of the Order thus arose:—A certain number of persons within the pale of the Establishment realised keenly the distasteful fact that those rulers and guides who by their rank, office, and opportunities, ought to have been actively engaged in defending things spiritual within that community, were evidently doing nothing of the kind: some of them, in fact, the very reverse. Many of the chief rulers obviously defended little else than their own authority and temporal possessions. Church rates had been duly abolished; the Conscience Clause deliberately allowed; the Divorce Bill had become law; the Elementary Education Act had been passed; and subsequently the whole machinery for any exercise of episcopal jurisdiction throughout England efficiently destroyed, by the simultaneous abolition of the Canterbury Court of Arches, the Chancery Court of York, and all the episcopal and archidiaconal courts of each and every diocese at "one fell swoop," through the setting-up of a new judge in a new court created alone by a recent Act of Parliament. They furthermore started with the assumption, if such it be, that the divisions of the Reformation era, by which the English Church—cut off from visible communion with the rest of Christendom—has remained ever since isolated and impotent because of its isolation, are a great practical curse, causing a vast waste of energy, continual disputations, and still more divisions: and that no more pressing nor lofty duty lies before the baptised than active co-operation and earnest work to secure visible Corporate Reunion.

But there was in fact another, and as he admits, still more important, ground for the scheme adopted. The existing evils requiring to be remedied are summed up in the Pastoral under six heads, and it was, we are expressly told, "mainly because of" the last two "that the policy of the O. C. R. was first formulated, and afterwards duly defined and defended." These points are thus laid down:—

5. Uncertainty of sacramental status, arising from the long-continued prevalence of shameful neglect and carelessness in the administration of Baptism, contrary to the directions contained in the Book of Common Prayer.

6. Want of an unquestioned Episcopal Succession.

The grand difficulty therefore, to which we shall have to return presently, was the doubtful validity of Anglican ordinations. Meanwhile the formal establishment of the Society is described in some detail by the writer. It seems that in the summer of 1877 "a solemn preliminary Synod was duly held in London, consisting of certain representative clergy of the Established Church, a *Promotor Fidei*, [P] with a notary public." On this solemn occasion "Mass in English according to the ancient Salisbury rite was said at daybreak, and all present communicated." And the use of the Salisbury—commonly, we imagine, called the Sarum—rite—i.e. the missal generally used in England before the Reformation—was no passing accident. "This deliberate liturgical restoration was an avowed protest against the tyranny and injustice of those who had robbed the national Church of its most sacred treasure, and had substituted for it the mongrel, mutilated, and bald service for the Lord's Supper now in public use." Moreover, the restoration "was effected for the O. C. R., by competent spiritual authority." We are told further that forms for the sacraments of Confirmation and Ordination and for giving Communion from the Reserved Sacrament were sanctioned by the same authority. But what pre-

ciously that authority is, or wherein its competence consists, is not explained. After the initial Mass and Synod all who could not produce satisfactory testimony of the validity of their baptism "had that sacrament administered to them *sub conditione*," and the Pastoral was carefully discussed and eventually adopted. "It is said to have been first promulgated about two months afterwards [why this sudden change from direct to indirect narration?], on the morning of the foundation day, the 8th September, from the steps of St. Paul's Cathedral by competent authority, in the face of credible witnesses." Perhaps this ceremony also was performed "at daybreak." The document "was then despatched to all the English bishops, deans, and proctors in Convocation, to the Holy Father, and to many distinguished Catholic prelates and theologians in various countries," and we are further assured that "its tone and terms secured a wide and almost universal commendation." Except as regards the last point, the authority for which is not given, the procedure reminds one strongly of the first start of the Irvingite movement, when the new Apostles also presented their credentials to the Pope, and to all the English, and we believe many foreign bishops, as well as to all Christian Sovereigns. We pass over the long extracts from the Pastoral which follow, as the document was noticed in our columns on its first appearance four years ago.

Our readers will have seen that the members of the new Order were conditionally baptized, and, inasmuch as baptism is an indispensable condition for the valid reception of all other "sacraments which impart a character," it follows of course that such of them as were clerics were next conditionally ordained. By the way we notice here one or two little slips in Dr. Lee's theology, if it is intended, as we may fairly presume it is, to be based on Tridentine teaching. He recounts "Confirmation, Orders, and Unction," as the three "sacraments which impart a character." According to the Council of Trent baptism should be substituted here for extreme unction, which last does not impart a character, and therefore may be, and often is, repeated. We are told again that "there is no other door or way of entrance besides [baptism] except the Baptism of Blood—i.e. martyrdom." The Tridentine Catechism, however, specifies "the baptism of desire," as well as the "baptism of blood"; as Dr. Lee puts it, none of the heathen, *e.g.*, could be saved. But to return to what, on his own showing, is the fundamental principle and justification of the new Order, the security of valid Orders and Sacraments. It is precisely here, on the most vital point, that the information supplied is most defective. We read (the italics are our own) "Sacramental integrity had been secured; and a valid succession *unquestioned either by East or West*"; but we are nowhere told how "this impregnable position" had been secured. When, where, or from whom was this "unquestioned" succession obtained? Dr. Lee speaks of "the grand act of charity and benevolence rendered to these Catholic Reunionists in the Church of England" by bestowing it, and, again, of its being "expressly asked and granted"; but by whom it was asked, and who granted it, deponent saith not. Yet this is surely the first point necessarily to be ascertained by those who are dissatisfied with the evidence for their existing Orders and Sacraments. It is hardly enough to tell them that, "if report be accurate [here, again, we have a saving clause interposed just where positive proof is most essential] nothing sacramental was left undone, and no act and deed was left unrecorded, *even by civil authorities recognized at the English Foreign Office*, to insure the existence of an undoubted and abiding record of certain most important and momentous acts." Are we to understand that this record is to be found, and may be consulted, in the Foreign Office? We are told of "the perfect frankness and good faith with which the appointed Rulers of the Order have fairly faced the obvious and increasing ecclesiastical difficulties of the day." Will they be good enough to inform the public when, and where, and from whom they received their episcopal consecration? Was it from the Old Catholics, or the Jansenist Church of Utrecht, or the late Archbishop of Syra and Tenos, or from any Roman Catholic prelate? Father Hutton of the Birmingham Oratory maintains, according to Dr. Lee, that for any Catholic Bishop to have taken part in these alleged consecrations would have been "a crime corresponding in guilt to that of some gross violation of the marriage tie in the social order." And it is anyhow most improbable that any Latin prelate would have desired or dared to perform what his Church would regard, and punish if discovered, as a grave act of sacrilege. We turn to the letter of "Lawrence, Bishop of Caerleon," appended to Dr. Lee's article, for some information, but we turn in vain. On the contrary, he observes that "a certain amount of reserve is necessary on some points; first, *because enjoined by the consecrators*; secondly, to adhere strictly to the scheme of supplying purely spiritual defects by purely spiritual means." The first reason is sufficiently intelligible, if hardly creditable to those concerned; the second is unmeaning, unless we are to believe that "purely spiritual" ordinances can only be administered in secret. It is a natural consequence of this "necessary reserve" that the Bishop of Caerleon does not venture to speak with the same confidence as Dr. Lee of his "unquestioned succession," but of "a succession which shall, *on due inquiry*, meet with the recognition of all." That is quite another thing. Anglicans, who believe their own orders to be valid, would say as much. But in their case the materials for due inquiry are at least open to all.

Into the grounds alleged by Dr. Lee for questioning the Anglican Succession this is not the place for entering at any length. The point on which he mainly, and indeed almost exclu-

sively dwells, is the fact, for which various authorities are cited, that a large proportion of the English people are left unbaptized. One clerical speaker at the Church Congress of 1879 is quoted as saying that "hardly more than ten per cent. of our people in our large towns are baptized in the Church of England." Be this as it may, one important link is missing to the completeness of the argument. It has to be shown that some of the unbaptized persons have certainly or probably been ordained and subsequently raised to the episcopate. And the only proof offered of this is Dr. Lee's statement that several cases have come under his own notice of late years where Anglican bishops have been less uniform than they should have been in demanding distinct proof of baptism from candidates for ordination, and that certificates of the canonical age have sometimes been accepted as sufficient evidence of baptism. We can only say that, if so, Anglican as well as ancient canons have been deliberately neglected or ignored. On these matters however we do not propose to enlarge here. But in any case the position of members of this mysterious Order, in the Church of England but not of it, be they many or few, is a sufficiently strange one; and we are told that "already there are representatives of the O. C. R. in almost every English diocese, and duly appointed officers who unostentatiously govern thus in things lawful." Dr. Lee argues that while "avowed Swedenborgians" and "sealed Irvingites" retain their benefices in peace, his own co-religionists have at least an equal right to do so. We were not aware of the existence of "avowed" Swedenborgians or Irvingites among the beneficed clergy, but the position appears, to say the least, an anomalous one. Moreover these new dignitaries do not seem to "avow" their position individually by any outward sign. It is evidently impossible for an outsider to know who is a "bishop," or "provincial," or "officer" of the Order, and who is not. Is the "Bishop of Caerleon" for instance a beneficed incumbent? Bishop though he be, he is permitted to govern "unostentatiously," and may still say in the words of an old dogglerel:—

I'm glad I'm not a bishop,  
To walk in long black gaiters.

And, as Mrs. Poyser pithily phrased it, "It's hard work to tell which is Old Harry, when everybody's got boots on."

#### A NEW ARGUMENT FOR VEGETARIANISM.

IT is probable that the crotcheteer is on the whole the happiest of men or women, as the case may be. The pursuit of reasonable objects has undeniably at times a tendency to bore the pursuer; the pursuit of unreasonable ones has the immense advantage of only boring other people. Therefore, while other people have their moments of lassitude, spiritualists and anti-vaccinationists and vegetarians and teetotallers, and suchlike folk, enjoy an *ignis vigor* which is in its way delightful to look on, except when it results as it occasionally does in the premature death of a good many innocent people, the plundering of guileless ones who are innocent in another sense, or the infliction of general annoyance and discomfort. The unfortunate Leeds merchant whom Mr. Dawson Burns has found athirst in a Great Northern dining-car, and to whom, in accordance doubtless with a private reading of the precepts of the Founder of Christianity, he has refused drink, may not like the *ignis vigor*; and the streetful of neighbours to whom a vigorous anti-vaccinationist the other day communicated small-pox may not like it either. But vegetarianism has at least the advantage of being less aggressive than these its sister lunacies. The vegetarian very frequently kills himself, but he does not insist on killing other people unless they are silly enough to listen to him. Moreover, his crotchet is free from some others of the ugliest features of new things. Combined with spiritualism, it might be used for the purposes of extortion by threatening the "kreophagist" malefactor with the ghosts of the animals he has eaten; but we never heard of an instance of this. Hence the vegetarian may be regarded with a certain amiable feeling of tolerance, in that, though occasionally suicidal, he at any rate lets other people live and thrive.

The latest vegetarian manifesto that has come to our knowledge is a very neat little book by Mrs. Anna Kingsford, M.D., which Messrs. Kegan Paul and Co. have just published. It is called *The Perfect Way in Diet*, a phrase admirably indicative of the mental attitude of the crotcheteer. The average kreophagist is by no means convinced that kreophagy is the perfect way in diet. Flesh and fish, like rebellion in a celebrated case, lie in his way, and he eats them and does well thereon; but, as to perfection, that is another matter. Mrs. Kingsford, on the other hand, will have none of your half-measures. She has looked at the teeth of man and the intestines of man; she has examined the descendants of his cousins, the other arboreal animals; she has cast a rapid eye on the science of ethics, the condition of Whitechapel, the pages of history, and the reports of outbreaks of trichinosis; and the result of it all is that she knows the "all-best" way of feeding. It must be confessed that we have not discovered anything very novel in the book, or anything which has not been said a hundred times by all vegetarians, and answered a hundred times by the fiendish kreophagist. It seems that the work is an enlarged translation of the thesis by which Mrs. Kingsford gained her doctorate at Paris. We are ashamed to say that we do not know exactly what other exercises are required for that proud position; but, if the thesis does the business by itself, it would

not appear to be very difficult to become an M.D. Mrs. Kingsford begins with an examination of our friends the anthropoid apes, by way of showing the similarity between us. It is really painful to know that in the chief point of difference the ape has the advantage of us, for he has a bigger stomach than we have. Otherwise there is no difference worth speaking of. Now he unquestionably is a vegetarian; therefore we ought to be, *q.e.d.* Then we have our old acquaintance the teeth argument, and several other physiological contentions, one of which is to the lay mind so exceedingly funny that, at the risk of appearing flippant, we must quote it. The peristaltic movements of the human stomach, it seems, take place in a circular direction; so do those of the herbivora; while the carnivorous stomach contents itself with sea-sawing in a prosaic manner from right to left and from left to right. "It does not appear," says Mrs. Kingsford, with much gravity, "that any opportunity has arisen of observing these movements in omnivorous animal." Here there seems a slight gap in the argument; but, such as it is, it evidently leads satisfactorily to the same conclusion as before. That conclusion is that "the abuse of the art of cookery in the hands of man degrades him to the level of a beast of prey." We confess that we never heard of a beast of prey who cooked, and that we had always thought that this little matter of cookery was of very considerable importance in the question; but this is probably owing to the weakness of kreophagist logic.

From physiology we pass to history. We begin at the beginning, and see that the earliest pages of the Book of Genesis (which Mrs. Kingsford knows was written by an Egyptian) plainly declare what Egyptian tradition held about the food of man. Our edition of Genesis is probably less complete than Mrs. Kingsford's, or else contains some spurious matter, for it certainly does not favour vegetarianism. Then we go from Egypt to Greece, where, on the authority of Rollin, we are told that athletes ate no meat, and that it was no regimen of flesh that formed the heroes of Thermopylae. If Mrs. Kingsford had consulted Athenæus and such-like authorities instead of the excellent Frenchman, she would have discovered that the famous black broth consisted largely of the same material as black puddings, that the *mysmia* were plentifully supplied with pork, and that there was usually a second course of game, poultry, lamb, &c. &c. Then we are taken all over the countries of the earth and the dietaries thereof. Mrs. Kingsford, following up her ill-luck with Rollin, trusts herself to a certain *Mod. Univ. Hist.*, whatever that may be, which informs her that the Japanese "never kill or eat anything that is killed." She tells us that "it is much more likely that the English navy owes his superior strength [as compared with French labourers] to gifts of rice than to his diet," which seems to overlook the well-ascertained fact that by lowering the diet of the one and raising that of the other the navy and his foreign competitor can be equalized and their positions in respect of work even reversed. After this we have the details of the perfect diet, in which it appears milk, eggs, butter, cheese, "may, without inconsistency, be included." Then comes the denunciatory part. The use of flesh meats hastens the arrival of old age. It is a dangerous stimulant. Mrs. Kingsford knew a young lady who got actually intoxicated on two mutton chops. Kreophagists go to and fro with exactly the same restlessness as the animals in a menagerie—it may be observed in passing, that the purely frugivorous monkeys are notorious for the sedateness of their demeanour. Kreophagism leads to alcoholism, and still more to immorality—the notoriously cleanly living of the vegetarian inhabitants of Western Africa is here a case in point, though Mrs. Kingsford says we ought to leave off flesh-eating because of its bad effects on the butchers, which is a charming pendant to Mr. Bright's demonstration of the necessity of abolishing capital punishment for fear of hardening the moral fibre of the ordinary of Newgate. Trichinosis, Dr. Richardson, the greater amount of food obtainable by tillage than by pasturage, Mr. Arthur Arnold, the artificial changes in the personal appearance of sheep and oxen bred for food, and many other persons and things are brought forward; and an interesting but somewhat irrelevant digression on the fur trade and the habit of wearing small birds in bonnets appropriately concludes the argument.

In all this there is, as has been said, very little that is new, though we do not remember to have seen so much stress laid before on the argument that the herbivorous stomach, peristaltically speaking, waltzes, while the carnivorous stomach only indulges in a kind of *chassé-croisé*. The truth is, of course, that all these physiological arguments are of very little weight. In the first place, the authorities are not by any means agreed as to the facts; in the second, the construction to be placed on those facts is anything but obvious; in the third, and most important of all, there is the question of results. Even if man were originally what Mrs. Kingsford thinks him, thousands of years of kreophagy must have pretty well hardened him to the poison by this time, even if they have not made it necessary. The historical evidence is still more valueless. The bulk of the examples produced simply go to show what everybody knows—that in hot, and especially tropical, climates very little animal food is necessary, or, indeed, desirable. Against this is to be set the potterous truth that all the greatest races of the world living in temperate regions have been kreophagist. If Mrs. Kingsford will read Rollin less and Homer more, she will probably form a different opinion about the kreophagy of the Greeks. The ruling tribes and castes of Europe have invariably been kreophagous. But, as a matter of fact, it is rather absurd to argue on such a point. We know we are kreophagous, and there's an end on't, is for once not an irrational answer.

To dogmatize on the excellences of meat-eating would be to come too close to the level of the dogmatizers on the excellences of vegetable-eating. The rule in all such points is to eat, not what the original arboreal animal with pointed ears ate, but what his descendant, the great-coated Englishman, living in a somewhat inclement climate, and with a great deal of work to do, feels inclined to eat, can eat, and is the better for eating. That the majority of such Englishmen feel inclined to eat, can eat, and are the better for eating fish, flesh, and fowl, is a simple fact of experience. As for ethical arguments, Mrs. Kingsford's unlucky admission of eggs lays her open to severe retorts. On the Buddhist principles which she favours (to the extent of favouring her readers with a long extract from Mr. Edwin Arnold's *Light of Asia*), the eating of an egg is one of the greatest crimes we can imagine. Here is life in the germ, and the fiend who wields his spoon at breakfast ruthlessly destroys it. The lamb who is brought to know what mint-sauce means has at least sported; the mutton, his mamma, has browsed, and observed the beauties of nature; the pig has enjoyed all the pleasures of pignood; the very stalled ox has had the opportunity of becoming a connoisseur in oil-cake, and of learning to distinguish different brands. But this unlucky egg, to which we are sure Mrs. Kingsford is too sound a physiologist to refuse the possession of life, if not in a very active condition, is deprived arbitrarily and unfairly of the opportunity of living. Not for him the crow of Chanticleer or the cluck of Partlet, the barley and the buckwheat, and all the other joys of fowls. Mrs. Kingsford, assuring him that she is not in the least inconsistent, boils him, eats him, and then writes a chapter denouncing the wretches who eat his mother. So much for the sentimental side of vegetarianism, which is worth about as much as its physiological and historical sides. The conclusion of the whole matter is, of course, *fay ce que voudras*, with the provision that you had better take care what you are about. The number of persons who have lost their lives from playing vegetarian tricks with their diet is, we believe, considerably greater than is generally known or supposed. We may gently hint, too, that kreophagy seems to have improved the external appearance of the human race considerably since the days of the arboreal animal, to judge from the outward ape of the oran-outang and his likes. That excess of stomach on which Mrs. Kingsford innocently comments admits of a very simple explanation. Besides, as Mr. Calverley would say, "We are not as outangs are." *Autres temps autres mœurs*; and for our own part we have not the slightest wish to exchange kreophagy and a tolerably comfortable and well-filled library for an abode on the fifth branch of the first tree on the left side of the Birdcage Walk, a completely frugivorous diet, and a natural suit of red-brown fur.

#### THE LAST OF NEWGATE.

THE *Beggars' Opera* has familiarized the educated classes with many expressions which belong to the thieves' slang of the last generation. Every one knows, for instance, the account which Gay's hero gives of himself:—

In a box of the stone jug I was born,  
Of a hempen widow the kid forlorn,

interlarding his musical biography with a reckless assertion that his hearers may persevere with impunity in illegal courses, or, as he metaphorically expresses it, "Nix, my dolly pals, fake away!" The song and the sentiment both belong to a time when our legislation was disgraced by a penal code of undue severity, and felony of any kind was punishable by death. Then, too, gaols were literally fever dens and hotbeds of crime, sanitary arrangements being altogether neglected, and prisoners indiscriminately herded together to spread moral corruption far and wide; discipline was also lax among them, and escapes were frequent. Newgate was the original "stone jug" mentioned by the poet, its euphemistic title being derived from the fact that it was surrounded by so strong a wall of stone-masonry that prison-breaking was rendered absolutely impossible there for the future. The name Newgate was taken, as we have already stated in a former article, from the fact that the buildings abutting on the gates of the City were in olden times almost invariably used as prisons. In 1218 the "Chamberlain's Gate" was pulled down, and the gaol attached to it was in 1412 replaced by the present erection, which was ever afterwards known as the Newgate Prison. It is now contemplated to demolish the gaol which has for so many years played a principal part in the criminal annals of the country; and by way of preserving at least some recollection of its historic associations we offer the reader a description of it as it exists at present. Although, thanks to the humane efforts of such men as Sir Samuel Romilly and Howard the philanthropist, the worst abuses of the criminal code and of prison discipline have been removed, the memories connected with the building are sufficiently gloomy and terrible. Here are brought for detention until trial all the numerous malefactors of the metropolis, as well as the more important criminals from the country, who are brought to London when, from local excitement or other causes, it is thought inexpedient to try them in their own counties. Here, too, is carried out, more frequently than at any other gaol in the kingdom, the last awful sentence of the law; and, although much that is to be seen is of a nature to afford anything but pleasant food for reflection, we think it desirable to chronicle it before the building has become a mere thing of the past.

The visitor to Newgate is received at the Governor's office, passing out of which he is ushered through a series of low, massive doors, and down a narrow, gloomy passage, into the old "pinioning" room. Here malefactors were formerly pinioned before being led to execution; but this is now done in the condemned cell itself. When executions were performed in public, the doomed men were led through the passage just mentioned to the narrow door, surmounted with irons, which leads out into the Old Bailey, where the gallows used to be erected in the open street. To reach this the sad procession had to pass through the kitchen of the prison, in which a narrow passage was formed by suspending two long black curtains from the roof. The hooks in the wall to which the lines which bore the curtains were attached still remain; but the principal object of interest to the visitor at the present day, and of pride to the warder who acts as his *cicerone*, is the steam contrivance for cooking vegetables. The pinioning room contains two large cupboards, in which are stored up the implements employed in the dreary business which forms one of the most important functions of the Newgate officials—namely, the execution of felons condemned to death within the metropolitan jurisdiction. Here, amongst objects of minor interest, are the leg-irons which prisoners wore in olden times, together with the anvil upon which they were riveted on arrival, the rivets being punched out when their wearer was about to be escorted through the kitchen to his death. A very heavy set of these irons is shown, which is said to have been worn by the celebrated Jack Shepherd, whose prison-breaking propensities made him once so celebrated. In Newgate itself no record of the sojourn of Mr. Harrison Ainsworth's hero exists, the prison which once stood in Wych Street having been the scene of his most notable exploits; the irons, therefore, are probably as unauthentic as the beheading axe which also forms an imposing part of the exhibition. This was certainly made for the purpose of amputating the head of the human subject, but, during the last generation or so at least, whenever a sentence of decapitation was passed, it was generally carried out in a less revolting manner, the culprit being first hanged and his head afterwards removed by a competent surgeon. The axe was carried in procession before the criminal rather as a symbol than as one of the working tools of an executioner. Thistlewood, the "Outo Street conspirator," was the last who suffered in this manner outside Newgate. Another very unpleasantly suggestive part of the collection is the set of straps with which condemned culprits are fastened and rendered powerless when upon the scaffold. A painful scene at the execution of one Bousfield led to the substitution of this apparatus for the rope arrangement previously in use.

The actual prison itself is a modern building, erected within the walls of the old gaol, and is built and managed on the "model prison" system, differing in no way in its arrangement from other gaols in the country. The peculiar and melancholy interest of the place centres, of course, in the provision made for the accommodation of the numerous prisoners under sentence of death who are lodged within the place. The condemned cell, with its dismal whitewashed walls and scanty furniture, and the two black chairs under the pulpit in the chapel, provided for the condemned man and for the warder who constantly attends him, though simple objects enough in themselves, are from their associations anything but pleasant to contemplate. Much more terrible in appearance, though less tragic in their use, are the "dark cells" for refractory prisoners. These are so dark, so isolated, and so impenetrable to sound that the most obstinate and violent subject would probably give in after a short experience of the discipline. An American visitor described the darkness as "something to lean against"; and we ourselves, after a very brief voluntary sojourn in one of them, experienced a most oppressive sense of meanness and dejection. Newgate being a house of detention and not a penal establishment, the discipline is not so severe as at other prisons, and the occasions upon which those "black holes" come into use is very rare. When we compare the present condition of the prison and its denizens even with the description given by Dickens, one feels a sense of relief and of hopefulness in the possibility of human improvement. The eminent novelist's account of the large groups of melancholy men walking up and down the spacious ward together, all awaiting the same terrible doom, and giving their last testamentary injunctions as to the disposal of tame pigeons and other "portable property," was no exaggerated or exceptional picture, but the usual preliminary of the ghastly gaol delivery on Monday morning. The still more horrible revelations of Fielding, and the last scenes in the lives of Jonathan Wild and his associates, belong to a more remote past; but their memories cling still to the place, which seems literally to lie under the "shadow of death." The prisoners, too, are for the most part awaiting trial, and are, therefore, naturally upon their best behaviour. Amongst the objects of historical interest in the prison is an old water cistern, in the pinioning room before spoken of, which bears the date 1781, the year after the Lord George Gordon Riots, during which Newgate was partially burnt down. Even this simple fixture recalls scenes of bloodshed without and of cold-blooded judicial murder within the walls, and gives a ghastly reality to the vivid description in *Barnaby Rudge*. Nowadays the sanctity of human life is more respected; and, although we have not yet arrived at that ideal stage of civilization which would enable us to abolish capital punishment, its surroundings are more decorous than they formerly were.

In one of the exercise yards stands the gallows, now a permanent erection contained in an ordinary-looking shed. In another

large room, where, under the old system—most happily abolished—the prisoners were allowed to herd together, and concoct plans for fresh robberies and other crimes, we are shown another instrument of penal human suffering, the whipping horse. As only the worst and most dastardly criminals are subject to this form of discipline, we can regard it with more calm feelings than the sinister apparatus which we have just left. The "cat" with which the punishment is administered is not so terrible a weapon as it used to be, but, in the hands of a stalwart warder, it is capable of inflicting very wholesome correction, and it is satisfactory to learn that garotters and the like regard it with salutary awe. We are happy to be able to assure humane persons who object to corporal punishment that, although a most deterrent implement, the "cat" is not in any way dangerous to life or health. It is, of course, easy to raise objections to its use, on the ground of the moral degradation which it entails, but the subjects upon which it is exercised as a rule belong to a class who are benefited rather than degraded by the process. In the same repository which contains the "cat" is a collection of ropes, destined for the purpose of carrying out the last sentence of the law. These are now supplied by the Government, and are sent out in numbers to the colonies.

An open-air passage, closed in at the top with iron bars, leads from the prison to the adjoining Central Criminal Court. This, which is known to facetiously-inclined habitual criminals as the "Birdcage Walk," is the cemetery of the condemned, and the warder, as he points to the letters cut in the old Roman wall to record the last resting-place of the many notorious criminals who lie there, waxes eloquent on the details of the murders which have from time to time filled the community with horror. A mere sketch of these would furnish material for pages of "sensational" description, which we forego for the same reasons which induce us to pass over the collection of ill-favoured castles from the faces of the executed criminals, taken after death. Newgate is full of reminiscences of the more stern and terrible phases of criminal procedure in the country; much of the brutality that was once thought indispensable to the preservation of law and order has passed away, and it is permissible to wish, however difficult it may be to hope, that a time may come when it will be possible to sweep away capital punishment itself. Interesting as the old prison is, we can hardly say that we regret its proposed demolition; and we sincerely hope that the executioner's museum within its walls will share its fate.

#### POST OFFICE REFORMS.

THE statements contained in Mr. Fawcett's speech, recently delivered in the Town Hall at Shoreditch, afford a striking testimony to the excellent spirit in which the work of his department is approached and done. It was natural that he should refer specially to that department before entering upon the subject of general politics, and the greater part of what he had to say concerning it was of an eminently satisfactory nature. But not the least satisfactory passage of the speech was that in which the Postmaster-General expressed a hope that it would "not be supposed that I wish it to be thought that, with regard to the administration of the Post Office, there is no more work to be done and no further improvements to be carried out." This is as it should be; but it is pleasant to see how much good work has hitherto been accomplished, and what good promise it gives for the future improvements which Mr. Fawcett has in mind. He began by referring to the "new form of money-order termed a postal order," which was devised to provide a cheaper and simpler way of transmitting money, and which was issued for the first time on the 1st of January last. It was then estimated that about two millions of these orders would be issued annually, and they are now being issued at the rate of four millions annually. Again, when it was proposed that these orders should be issued for as low a sum as a shilling, it was feared that "there could be no demand for the means of transmitting such small sums." Here the event completely proves Mr. Fawcett to have been in the right, inasmuch as postal orders for a shilling are now being sent out at the rate of more than four hundred thousand a year. While he was careful to refrain from asserting that the whole of this amount is to be explained by the convenience found in the use of these orders by the poorer classes, yet nobody will be inclined to dissent from his suggestion that "there can be no doubt that a very large proportion" is used by these classes, or to hesitate in the conclusion that by simple means a great benefit has been conferred upon people who stood in need of it. The lessening of trouble gained by the possibility of sending one of these postal orders is obvious on the face of it, and the question as to whether this gain would be widely enough appreciated to warrant the change being made has been answered in the only way that is completely satisfactory and irrefragable. To show, Mr. Fawcett said, how little ground there was for the fears expressed before the new system had been tried, he stated that "more than 900,000*l.* worth of these orders had been issued at the end of August, and only 20,000*l.* worth remained unpaid." This is certainly as strong a proof as could be wished for of the desirableness of the step taken.

From the consideration of the new postal orders Mr. Fawcett passed on to that of the employment of female clerks, by a staff of whom the whole clerical work connected with these particular orders is done at St. Martin's-le-Grand "in a very satisfactory

manner." The speaker further stated that a good deal of other important work in his department was done by female clerks, of whom about two hundred and seventy are employed, "and the number is rapidly increasing." As an evidence of the desire to obtain these appointments, it was set forth that on a late occasion no less than 920 candidates competed for 40 appointments. There are two sides, if not more, to this question, although it is but natural that the Postmaster-General should contemplate only one, and should take pleasure in its contemplation. Putting aside the general difficulty attending competitive examinations as they affect rejected candidates—a difficulty which, however, is more serious here than in ordinary cases—it remains to ask whether it is a really good thing for the successful candidates to get what they have tried for, and whether it is a really good thing for the public service that they should get it. One would like to have, as a rider to the Postmaster-General's cheerful statement, some statistics showing what is the proportion of the work done by female clerks as compared with that previously done in the same department by male clerks, and showing also how, and to what extent, the health of the female clerks is affected by their employment. It would be rash to endorse or echo all that the Postmaster-General has said of the satisfactory working of the system without fuller and more precise information on this and other points. It seems the more desirable to touch on this because Mr. Fawcett, passing from the particular to the general, thought it evident, from the results of employing women in the Post Office, "that the extension of the field for the labour of women would be of great advantage, not only to women themselves, but to their employers, whether those employers were the Government or private persons." This opens a field for discussion wider than we can here enter upon; but it may be observed that the conclusion is certainly sweeping, and that the premises are not altogether beyond doubt. Leaving this special branch of his subject, Mr. Fawcett went on to pay a graceful and well-deserved compliment to Lord John Manners, to whom, he said, the credit of introducing the new postal orders was more due than to himself, since "at the time of the dissolution he had passed through its earlier stages a Bill which would have authorized their issue." From this Mr. Fawcett went on to speak of other matters, among the most interesting of which was the plan for receiving small Savings Bank deposits in stamps, and in what he had to say as to this there was no ground for dissatisfaction or doubt. The figures, indeed, speak to a great extent for themselves. "In eleven months the number of depositors in the Post Office Savings Banks has increased by no less than 436,000." Part of this result, Mr. Fawcett said—and it is to be hoped he was right in so saying—was no doubt due to the normal growth of habits of saving among the people; but "it is particularly to be remarked that, whereas the number of depositors increased by 436,000 during the eleven months that the plan has been in operation, during the previous eleven months, when it was not in operation, the number of depositors increased by only 94,000." The speaker went on to give some special instances of the satisfactory working of the plan, and concluded this branch of his subject by pointing out that, "of the 709,000*l.* invested through the Post Office Savings Banks in Government Stocks, 271,000*l.* have been withdrawn from the Savings Banks deposits for investment; yet, in spite of this withdrawal, the aggregate amount now deposited in the Post Office Savings Banks is 2,181,000*l.* more than it was eleven months since."

That very much good work has been done under the rule of the present Postmaster-General is evident enough; but it is also evident that, as he himself has pointed out, much that ought to be done remains undone; and, unluckily for the prospects of immediate action in these matters, the doing of them does not rest with Mr. Fawcett. The reduction of the price of telegrams is subject to the decision of the Chancellor of the Exchequer, and is beyond the control of the Post Office. Mr. Fawcett is officially, and probably really, content to leave this to the unrivalled financial skill of Mr. Gladstone; but there have been and are people who, while they admit the unrivalled skill, may not feel quite so safe as Mr. Fawcett does as to the direction which Mr. Gladstone's delight in exhibiting this skill may take. More important, inasmuch as it involves a danger to which Mr. Fawcett did not refer, is the consideration of laying telegraph wires underground instead of overground. Most of us have suffered in some way from the inconvenience which the speech referred to of the interruption of telegraphic communication during the recent storms—an inconvenience which would have been avoided if the wires had been laid underground. But there is also no doubt that the overground system has added a new danger in stormy weather to human safety, and, indeed, to human life. A falling telegraph-wire is well enough fitted for the purpose of decapitation, and though horses have most frequently suffered from this, inasmuch as their heads are naturally in the best or worst position for catching the blow, yet the danger is not one that ought to be overlooked. But, Mr. Fawcett said, the conversion of overground into underground wires "would be very expensive." It is satisfactory to find that a report as to this matter is to be furnished to the Postmaster-General; but it would be rash to hope confidently that his representations after the report will lead to the reform which seems to us urgent enough. The old proverb about a ha'porth of tar is slow in carrying conviction in some quarters. As to the parcel post Mr. Fawcett spoke yet more strongly of the need of change, but with no more certain hope of the change being made than he could hold out with regard to the telegraph wires. It seems also desirable to note the fact to which the Lord Chief Justice has lately called attention, that the

Post Office is in this way different from ordinary banks, that it does not hold itself in any way responsible for payment made on a forged signature. This is a fact which heavily discounts the advantages referred to above, on which the Postmaster-General dwelt in his able and interesting speech. We might, however, be sure, even without Mr. Fawcett's assurance of the fact, that in these, as in other matters, no effort will be wanting on his part to secure all the convenience that he can for the public.

The greater part of Mr. Fawcett's speech was naturally enough, as we have said, taken up with the consideration of matters connected with his own department; but before he finished he called attention to one or two questions with which his name, like that of his master, Mr. J. S. Mill, is especially identified. Mr. Fawcett, in common with his Radical colleagues in the Ministry, is in favour of extending household suffrage to the counties; but, unlike most of them, he urges, with Mr. Mill, the absolute necessity of accompanying a wide extension of the suffrage with proper guarantees for the representation of minorities. The subject is one which Mr. Fawcett could not fully treat at the flag-end of a speech, and it can as little be treated at the flag-end of an article. But it is pleasing to find the most respected of our Radical politicians speaking so plainly before a popular audience on behalf of the minorities whom most of his party look on only as things to be trampled on.

#### THE SPANISH BUDGET.

IN criticizing Señor Camacho's Budget, it is fair to bear in mind that the task he has undertaken is both difficult and meritorious. Long-continued misgovernment, incompetence, dishonesty, revolution, and civil war have all combined to destroy the credit of Spain and to throw her finances into confusion. It is something on the part of a Finance Minister to endeavour to remedy such inveterate evils, and to recognize the obligations which rest upon his Government. If Señor Camacho's proposals are not always well considered, they seem, at least, to be honestly meant, and many of them will introduce great improvements. The Budget consists of two parts; the one dealing with the income and expenditure of the current year and next year, and the other treating of the debt. We shall first consider the former. Señor Camacho frankly admits that Spain is suffering from chronic deficits. Although civil war has long been ended, although peace has been restored to Cuba, and although the late Government professed to be paying off debt at a rapid rate, it now appears that last year there was a deficit of 3,640,000*l.*, and it is estimated that the current year will end with a deficit of 4,240,000*l.* To cover these deficits the new Finance Minister proposes, first, a conversion of the redeemable debt, to which we shall return by and by, and, secondly, a revision and equalization of taxation. It was stated by one of our Secretaries of Legation in a Report two or three years ago, that about 43 per cent. of the land in Spain pays no land-tax, and that of the remainder a considerable proportion pays less than its due share of the tax. Señor Camacho proposes to equalize the incidence of the land-tax, and at the same time to reduce its rate from 21 per cent. to 16 per cent. The proposal is undoubtedly in the right direction; but 16 per cent. is still an enormously heavy rate. It amounts to nearly 3*s.* 4*d.* in the pound, and, unless the new Finance Minister is able to secure purity of administration, such as has never hitherto been known in Spain, we greatly fear that the evasions of taxation of which he complains will continue to be practised. It would be wiser to reduce the rate of the tax considerably more, and then to endeavour to enforce its payment by stringent measures. But perhaps a reduction of 5 per cent. in a single year is as much as we have a right to expect from any Minister. Probably he has not very much faith in his own ability to enforce the collection, and he hopes more from the equalization of its incidence than from the efforts of the Administration to get in all that is due to the Treasury. The Minister further proposes to revise the taxes on industry and commerce; to suppress tolls and bridge and ferry dues; to diminish the tax on the salaries of Government servants; to reduce the price of tobacco; and to impose a tax upon rents. These are large and far-reaching measures, and they are mostly in the right direction. Our only fear is that they are too ambitious; that Señor Camacho is endeavouring to do in a single year the work of several years, and that the results will not answer his expectations. However, it is clear that the principle involved in most of these proposals is right, and that, if the present Government follows up the beginning now made, an elasticity hitherto unknown will soon appear in the finances of Spain. There is no doubt that the country is rich in resources, that it has been prospering of late years, and that the people are able to pay much more than they now pay. A rational system of finance would soon prove this, and would enable the Government to fulfil its obligations to its creditors. Lastly, Señor Camacho proposes to deal with the Customs tariff. All existing duties above 15 per cent. and under 20 per cent. are to be reduced to 15 per cent., and afterwards those of 20 per cent. and upwards are also gradually to be reduced. As a consequence of this reform, the Government is to enter into negotiations with other countries for commercial treaties, it being expressly provided that countries which have not commercial treaties with Spain are not to enjoy the benefits of the reduction. In this country we are

specially interested in this proposal for reducing the Customs duties. The late Spanish Government legislated in a hostile manner against this country, and we have every reason to welcome the better spirit shown by Señor Camacho and his colleagues, and to hope that his Budget may meet with the acceptance it deserves.

Coming now to the second part of Señor Camacho's Budget, we find that he proposes to fund the redeemable and floating debts, which now absorb for interest and sinking fund about 7 millions sterling a year. The proposal is that a new debt of 72 millions sterling nominal shall be created, bearing 4 per cent. interest, and redeemable in forty years, the issue price being 85. The interest and sinking fund on this debt would not much exceed 3 millions sterling, and the funding would thus leave free very nearly 4 millions sterling to assist Señor Camacho in covering the deficit which, as we have seen, he estimates. But the old perpetual debt claims a portion of this sum. Under the existing arrangement with the bondholders, Spain pays 1 per cent. upon this old perpetual debt up to the end of the present year, from and after which time the interest is to be increased by an additional  $\frac{1}{2}$  per cent., which, in round numbers, will add to the charge about 1½ million sterling. This leaves free only about 2½ millions sterling to be applied to covering the deficit; and by means of this, and the revisions and reform of taxes to which we have referred above, Señor Camacho estimates that the income will amount to 31,319,809½, leaving a small nominal surplus of 13,841½. It will be seen that the equalization of income and expenditure thus brought about is really effected for the most part by the suspension of the sinking fund now applied to paying off the redeemable debt. In other words, the pretence of paying off debt made by the late Government had no foundation, for as fast as it paid off debt with one hand it incurred debt with the other hand. Still it will be something that, even by the suspension of the sinking fund, Spain is able to pay her way; but it remains to be seen whether the Minister is not too sanguine in his estimates.

Señor Camacho, as we have said, proposes to carry out the convention made with the bondholders five years ago, and to pay 1½ per cent. on the foreign debt from and after New Year's Day next. He also asks power from Congress to negotiate with the bondholders both of the foreign and of the internal debt for a new arrangement. Hopes have been entertained for some time back that the new Minister would propose a plan for converting these debts, and various schemes had been propounded by which this could be done with advantage to Spain and to the bondholders. Señor Camacho, however, does not put forward any plan or even suggestion, but contents himself with taking power to negotiate with the bondholders. It is to be hoped that, if any of the schemes to which we have referred are put forward, they will not be entertained by the bondholders. In all past experience conversions of the debt by Spain have meant partial repudiation. Spain has pleaded, first, that the capital of the debt was larger than she was able to pay, and she has induced the bondholders to agree to cut down the principal on condition of receiving punctually a high rate of interest. Then she has pleaded that the rate of interest was too high, and that she could not go on paying it; but that if her creditors would meet her fairly, she would do her best, and would pay a lower rate of interest. When the creditors agreed to accept a lower rate of interest, she again pleaded that the principal of the debt was too large; and thus she has gone on reducing principal and interest until it almost seems as if the whole of the debt would ultimately disappear without the creditors receiving anything. There is no reason why the creditors should now be tender-hearted in their dealings with Spain. The country is rich in resources. It has been making great progress of late, and it is well able to meet its obligations. Partly owing to the restoration of peace, and partly owing to the ravages of the phylloxera in France, and the successive bad wine harvests there, the trade of Spain has been rapidly growing of late years, particularly the wine trade. The French wine production having fallen off, French wine-makers have imported immense quantities of Spanish wine, and have mixed it with their own deficient yields, and sold it as French produce. The result has been to pour wealth into Spain, and there is no ground for her now pleading that she is unable to meet the claims of her creditors. It also seems to us rather hard upon the bondholders that the redeemable debt should be given a priority over the old debt, and should be assured a much higher rate of interest. The new funded debt of 72 millions sterling is to be a preference debt, and is to receive, as we have already said, interest at the rate of 4 per cent. per annum. Moreover, certain revenues are to be made over to the Bank of Spain to ensure the performance of the contract. We fail to see on what grounds the floating debt and redeemable debt creditors receive this preference over the old bondholders. No doubt these debts were incurred—in part, at least—during the civil war, and every Government is justified in doing whatsoever may be necessary for its own preservation. But when everything is said, the creation of a preference debt in such a manner is giving a premium to those who lend to the bankrupt at usurious rates of interest. The real explanation of the favour shown to this class of creditors is not so much that they came to the relief of Spain when she was fighting for her integrity, for that applies only to a part of the debt. The real explanation is that this class of creditors have means of bringing pressure to bear upon the Court and Government of Spain, and that therefore they are able to secure for themselves terms which the general bondholders cannot obtain. But the old bondholders are not altogether without resource, and they should

seriously consider in their negotiations with Spain whether they should permit this preference to be given to the new class of creditors. No doubt the old creditors gain by the proposed arrangement respecting the redeemable debt; for it is only by means of this arrangement that Señor Camacho finds himself able to pay to them the additional  $\frac{1}{2}$  per cent. which the Government of Spain is bound to pay from and after New Year's Day next; but, on the other hand, if the creditors of the redeemable debt were placed upon the same footing as the old bondholders, the latter would obtain a still better rate of interest. Anyhow, the prospect of an increased rate of interest for the old bondholders does not seem very great. If to pay them an additional  $\frac{1}{2}$  per cent. Señor Camacho has to suspend the sinking fund, and to convert the floating and redeemable debts into what is practically a permanent debt, where is he to obtain the means of still further increasing the interest on the old debt? Possibly the reform of the taxes which we have described above may yield a larger revenue in future. Señor Camacho may follow up his Budget of this year by measures in the future which will ensure the punctual payment of the various taxes; and, if he does this, no doubt the receipts will grow rapidly. But it will be necessary for him to reform altogether the old system of taxation, and at the same time to weed out and purify the administration.

#### RECENT MUSIC.

HERR HANS RICHTER'S two concerts at the beginning and end of last week may be said to have begun the autumn concert season of 1881, and if the success of these performances is any promise of the future, we may well look forward to a season of more than usual interest. On this occasion, with the exception of two items, the programme has been strictly confined to the performance of the works of Beethoven and Wagner, the two masters that Herr Richter is acknowledged to have studied most profoundly, and it was no doubt partly in consequence of this that St. James's Hall was at both concerts filled with a most enthusiastic and appreciative audience.

The first concert opened with Herr Wagner's striking overture to *Die Meistersinger*, an opera which stands in the *répertoire* promised to us at the Grand German Opera at Drury Lane next year, and which is remarkable as a specimen of the composer's wonderful versatility in his art; for in *Die Meistersinger* he has forsaken legend and adopted realism. *Rienzi*, indeed, deals with the affairs of men; but it does not rank in the same class as *Die Meistersinger*, being, as the composer himself avers, different in its essence from his later compositions. The effect produced at this performance was of the finest, and showed that the orchestra had been no less carefully trained to their work than on the other occasions when they appeared before the public. To the *Meistersinger* overture succeeded six songs by Berlioz, for solo voices, with orchestral accompaniments, the words being written by Théophile Gautier, and translated into English by Mr. Franz Hueffer. Mr. Hueffer's translations are certainly not happy; and when we consider how much importance Berlioz, in common with all great composers, attached to the words that the music is intended to accompany, it seems unlucky that the original text should be marred by ineffective translation. Not content with distorting English idioms, as when he uses "fro and to" for "to and fro," Mr. Hueffer thus translates:—

Un air, comme en soupir aux cieux  
L'ange amoureux.

Such songs may breathe in realms above,  
Angels of love.

As to Mr. Hueffer's capacity for catching the spirit of Gautier's verse, one other quotation from a poem which M. Gounod has also set to music may serve as a specimen. At the end of the *Barcarolle* which begins with the words "Dites, la jeune belle," we have:—

Menez-moi, dit la belle,  
A la rive fidèle  
Où l'on aime toujours.  
— Cette rive, ma chère,  
On ne la connaît guère  
Au pays des amours.

Mr. Hueffer renders this passage:—

"Carry me," cries the maiden,  
"To that enchanted Aiden  
Where true love never dies."  
That fair land to discover  
Full fain is many a lover.  
But who knows where it lies?

If this is translation, then translator's work is indeed easy. But it leads us to ask the question, Why, in the name of reason, should not the original words be sung? Surely it will not be said that our singers are incapable of singing in the French language! The same words are sung over and over again to M. Gounod's setting, and why not to Berlioz's? Who would think of performing Beethoven's Choral Symphony with an English translation of Schiller's "Ode to Joy," which is used at the end of it? Is German easier to sing than French, or is it easier for the public to understand? The truth is, we fear, that translators of songs and operatic libretti think that any words will serve as a translation, provided they rhyme to a certain degree and fit in with the music; but we are sorry to see that Mr. Hueffer has

followed in the wake of such translators. It is some satisfaction to think that the words did not absolutely mar the effect of Berlioz's music, which, though tinged with that peculiar melancholy so characteristic of much of his work, will repay the study it demands. The songs which are likely to become most popular are, to our thinking, "The Spectre of the Rose," which was finely sung by Miss Ellen Orridge, and "The Tomb," which Mr. Shakespeare rendered with much feeling. The remaining songs were well sung respectively by Miss Louise Pyk and Mr. King.

Mr. Eugène D'Albert's Concerto in A followed. The composer, who played the pianoforte part on this occasion himself, is only seventeen years of age, having been born in 1864, and appears before the public as a musical prodigy. It is a difficult part to play, and Mr. D'Albert certainly performed it with a modesty worthy of his great abilities. Trained under the professors of the National Training School for Music, at which school he gained in 1876 a Northumberland Scholarship, he completed last year the score of the Concerto in A which was performed on this occasion; and, although not altogether unknown to the musical world, Mr. D'Albert probably owes to Herr Richter's appreciation his appearance in public thus early. Of the Concerto itself it is, perhaps, not too much to say that it gives evidence of great intellectual power and vigour of thought, as well as a knowledge of the intricacies of orchestration, remarkable in so young a musician. The work consists of three movements—"Allegro moderato," "Andante sostenuto," and "Allegro vivace," of which the second movement is perhaps the most attractive. The whole work, however, is masterly, and although the influences of Mendelssohn, Schumann, and even Chopin are at times evident, yet in no passage that we could mention is any servile imitation to be observed. We are far from saying that the production is faultless. There are faults, and grave ones. In some parts of the work, for instance, the pianoforte is absolutely inaudible owing to the very heavy orchestration, and thus the want of reservation of power, the waste of energy, as one may say, tends to confuse and impair the value of many an otherwise telling passage. Then, again, the inordinate length of the various movements wearies the listener and shows the inexperience of the composer. These, however, are faults which time and study may remedy, and we trust that Mr. D'Albert, regardless of his first successes, will work as he has hitherto done, and attain that goal which talent deserves. In bringing Mr. D'Albert thus prominently before the public, Herr Richter has shown that he is cosmopolitan and unprejudiced in matters musical; and we are sure that the young composer cannot be dissatisfied with the way in which the orchestra rendered his work on this occasion. This concert concluded with Beethoven's Choral Symphony, which it is only necessary to say was as admirably performed as upon former occasions.

The second Richter concert opened with the overture to Wagner's *Tannhäuser*, to which the orchestra did due justice, the *accelerando* towards the close being especially remarkable; and this was followed by the "Vorspiel" and Isolde's "Liebestod," from the same composer's opera of *Tristan und Isolde*—an opera which we are promised next year at Drury Lane, but which is as yet unheard in England. This was perhaps the most unsuccessful of the selection from the Wagner *répertoire* which Herr Richter has chosen, as the pieces were taken from the beginning and end of the opera—a combination not likely to unite harmoniously, and therefore apt to create a feeling of incongruity. At the time of the first concert the "Walkürenritt" and "Siegfried's Tod und Trauermarsch" were announced; but, owing to the fact that the holder of the performing right of *The Niebelungen Ring*, Herr Neumann, had refused permission to perform them, these two numbers were cut out. Instead of them, however, the "Siegfried Idyl," which followed the "Liebestod," and the overture to the *Fliegende Holländer*, were substituted. The "Siegfried Idyl" was composed, shortly after the birth of the composer's son Siegfried, in honour of Mme. Wagner, and was played as a serenade on her birthday in 1871 for the first time. It is constructed upon themes mostly taken from the opera of the same name, which Herr Wagner had then just completed, and is written for a small orchestra. Simplicity and extreme tenderness are its especial features, which are greatly enhanced by the skilful use which the composer makes of the old German cradle-song, "Schlaf, Kindlein, schlaf." The overture to *Der Fliegende Holländer* came next, and was played in a manner worthy of an orchestra well trained, and conducted by Herr Richter.

The second part of this concert consisted in the performance of Beethoven's Third Symphony, the "Eroica." This symphony, which the composer intended to dedicate to Napoleon, an intention which he gave up when he heard that the Consul had assumed the title of Emperor, contains as its second movement the magnificent Funeral March, which was rendered with profound pathos at this performance, while the manner in which the airy Scherzo which follows it in startling contrast was played was nearly faultless. The "Eroica" has been so often given here that it is unnecessary to say more than that the performance sustained in every way the great reputation of Herr Richter and his orchestra.

We may here observe that the prospectus of the Grand German Opera at Drury Lane has been issued, by which we see that, besides Herr Wagner's *Tannhäuser*, *Lohengrin*, and *Der Fliegende Holländer*, the *Fidelio* of Beethoven, and the *Euryanthe* of Weber will be performed every Tuesday and Thursday from 18th May to 27th June, 1882. The artists engaged comprise Frau Sucher, Fräulein Malten of the Dresden Opera, Fräulein Wiedermann; Herr Winkelmann, who

had been chosen by Wagner to perform the part of Parsifal in his new opera of that name; Herr Wolff, Herr Gura of Hamburg, and Dr. Kraus; while the entire chorus of the Hamburg Opera House has been secured, and the orchestra will be that of the Richter Concerts. The operas will be conducted by Herr Richter, and the whole will be under the direction of Herren Hermann Franke and B. Pollini. *The Niebelungen Ring* is, according to recent accounts, to be performed at about the same time at another theatre, under Herr Neumann's direction, and at an earlier date Mr. Carl Rosa proposes to give some of the Wagnerian operas in English. We hear with regret that it is likely that Mr. Rosa's intention of including Mr. Villiers Stanford's *Prophet* in his next season's performances may not be carried out. It would be matter for much regret if Mr. Rosa were unable to satisfy his own and his admirers' aspirations by bringing out an opera in English by an English composer as it ought to be brought out, and we must hope that any difficulties which may stand in the way of his doing this can and will be overcome.

On Monday last the directors of the Monday Popular Concerts began their twenty-fourth season with a string Quartet in A Minor, by Johannes Brahms, which was played for the first time in England on this occasion. Numbered as Op. 51, No. 2, this quartet consists of four movements, "Allegro non troppo," "Andante moderato," "Quasi minuetto," and "Allegro non assai." The first movement, which is also the most intricate, contains some very effective passages and much clever contrapuntal writing, while the second and third are simpler both in construction and expression. We are inclined to think that the second movement is likely to be preferred to the others; but it is almost impossible to judge from the first hearing of so important a work. The rendering given of it on Monday night by Herr Strauss, Mr. L. Ries, Mr. Zerbini, and Signor Piatti, was, however, highly satisfactory, and we hope to have another opportunity of hearing this work. After a graceful serenade, the composition for piano and violoncello of Signor Piatti, which was effectively sung by Mr. E. Lloyd, and accompanied by the composer, Mlle. Janotha played two pieces. The first, a *khapsodie* in B Minor, by Brahms—a novelty at these concerts—is a piece full of difficulties, which were finely met by the pianist, and it abounds in startling contrasts artistically welded together to form, as the analytical programme says, "a consistent whole." The second was Mendelssohn's well-known Andante and Rondo Capriccioso. Mlle. Janotha played the Andante with great feeling and grace, and the Rondo with lightness and speed which were almost amazing, and procured for her such applause that she had to resume her place and play a Mazurka by Chopin. The second part of the concert began with three pieces for pianoforte and violoncello, early works of M. Rubinstein, and not particularly remarkable. However, Mlle. Janotha and Signor Piatti contrived to give an interest to them by the fine manner of their performance. Mr. E. Lloyd sang a song, "Regret," by Schubert, with success, and the concert terminated with Haydn's quartet, Op. 42, in D Minor.

#### THE THEATRES.

THE St. James's has opened with a list of performances of the kind our best comedy theatres regularly give us—a new adaptation from the French and the revival of an old one. *The Cape Mail*, which is the new play "adapted from the French by Clement W. Scott," is, as all the world knows, though the playbill does not say so, a version of *Jeanne qui pleure et Jeanne qui rit*. This, in its turn, is one of many variations on an old motive, among which are *La Joie fait Peur*, and a play given in London by the Dutch company, *De Militaire Willemsoorde*. In Mr. Scott's adaptation a Mrs. Frank Preston, the wife of an officer who is supposed to have fallen at Rorke's Drift, and his sister Mary, go through the martyrdom of pretending to believe him still alive in order to spare his blind mother the shock of learning the truth. To keep up the delusion, they not only invent letters on the spur of the moment, but go to balls and wear fine dresses. At last a letter comes, through the family lawyer, telling that Preston is alive, and the piece ends happily—all of which any one may find touching that likes. For ourselves, though quite ready to agree with that moralist who would have lied with Desdemona, we think that a fine sentimental motive is not dramatic excuse enough for a long and elaborately acted lie, particularly when it is useless and the acting overdone. Mrs. Preston could not have deceived her husband's mother for ever, to say nothing of the fact that the grief which left her capable of such capital acting and so much literary activity in the way of inventing letters cannot apparently have been very intense. In reality, such a deceit would be both cruel and cowardly. Besides, why should the two ladies deceive the world at large, as they appear to do, and add its contempt to their sufferings? The barefooted Carmelite, who suffers all kinds of misery because her faith teaches her that it is the highest of duties, is an object of respectful pity; but a woman who should torture herself without the faith would only be fit for a madhouse. And Mrs. Frank Preston suffers just such an uncalled-for martyrdom. Many, too, of the mere incidents of the piece are not properly accounted for. Is it likely, for instance, that in these days of telegrams and the vigilant Correspondent, Preston's wife would have been left to learn of his safety from a letter? The motive of the piece is not

sufficient, and the incidents do not appear inevitable and natural; it is, in fact, essentially undramatic, and so obviously a mere piece of machinery—and even creaking machinery—for the production of sentiment, that it defeats its own end. Such as it is, it is acted in a manner creditable to the theatre. All the parts were fairly well filled, and the two chief ones—those of the blind Mrs. Preston and her daughter-in-law—were given very finely. Mrs. Gaston Murray gave a touching rendering of blindness and the timid dependence it causes. Mrs. Kendal acted with power as Mrs. Frank Preston. The unreality of the piece could be for an instant almost forgotten while watching her as she hears the reading of the letter which tells of her husband's safety. There was a rise to real tragic force from her first thought that it is only another pious deception to the moment when she knows it is true, and tears the letter from her sister's hand.

Mr. Robertson's *Home* is an adaptation in the fullest sense of the word. It has the same sort of relation to the *Aventurière* of Emile Augier which a signpost copy of Reynolds's "Lord Heathfield" might possibly have to the original. Perhaps even less, for the sign-painter might be trusted to add nothing, while Mr. Robertson thought fit to introduce a quite unnecessary Miss Dora Thornhaugh. But then, possibly, she is not quite superfluous. There is, to be sure, no dramatic motive for her existence, and there is more than one very good one why she should not be there; but she gives occasion for a great deal of comic love-making, which would be well enough in a farce, and afford a fine opportunity for Mr. Toole or Mr. Royce. It is not the less quite out of place in *Home*. There is also, we conceive, another reason for her existence. In the *Aventurière* Fabrice returns home, after a wild youth, to find his father about to fall a victim to an adventurer. He saves him by deceiving the woman into a belief that he is himself a wealthy man, and so persuading her to be false to his father, and then sends her away. At the close he discovers that her affection for him has grown to be real, and is left reflecting on the one sincere love he has found on earth. Now this would apparently be found too hard for an English audience, and Miss Dora Thornhaugh was invented to give Colonel John White his proper share of the domestic affections, and destroy the dramatic pathos of his character. As it is with Fabrice, so it is with the whole piece. The tone has been lowered throughout. And what is kept is made as wonderful as what has been added. Having resolved to bring the date of the play down to our own time, Mr. Robertson must needs allow Colonel White to frighten Mountraffe by the threat of a duel. Don Annibal was naturally scared by finding that Fabrice knew all about the famous *coup de Matapan*; but a Captain Mountraffe would simply call for the police. If we had the occasion or the space, it would be easy to show that every scene and every character in *L'Aventurière* has been spoiled in exactly the same way. The worst instance is probably the frothy nonsense of the love scene between Colonel White and Mrs. Pinchbeck. The acting of the play is, on the whole, inferior to the acting of *The Cape Mail*. Mrs. Kendal is comparatively tame and colourless, and never makes us forget for a moment how inartistic the character she is playing really is. Mr. Kendal is wholly unsuited to his part. Only the gayest comedy could make Colonel White tolerable, and it is quite wanting in Mr. Kendal's acting. Mr. Wenman played the part of Mr. Morrison firmly and well. It is somewhat harder to estimate Mr. Hare's rendering of Captain Mountraffe. No Mrs. Pinchbeck would allow herself to be hampered by a fellow with the manners of an insolent groom; but, granted that she would, then Mr. Hare's acting is consistent and finished. He quite makes us share Colonel White's longing to kick the insolent intruder. And, after all, Mr. Hare's acting is not more out of place than the part of Captain Mountraffe in *Home*.

In whatever sense the words may be taken, *The Half-Way House* exactly suits what has for long been the tone of the Vaudeville. Like most of the pieces which have been brought out there of late, this so-called comedy is a combination of the farce in three acts with the domestic melodrama. What plot it has is melodramatic, and the element of comedy is supplied by the mechanical puns of the dialogue, which are let off like crackers whenever they are out of season—that is, from the beginning of the first act to the end of the third. It is a serious task to attempt to give any notion of what this "comedy" is like. It manifestly cannot be said to depend for its interest on the construction of its plot. Everything is set going by some complicated series of events which took place before the curtain rose, and which the audience is justly supposed to be too impatient to listen to. The general wind-up is obviously brought about by everybody's recognizing that the thing has lasted long enough; and that it is time to do what, supposing anything remotely similar to be possible in real life, they would all have done somewhere about the middle of the first act. Neither can the author, Mr. Sims, mean us to take his characters seriously. A young country gentleman, the soul of honour and an ideal lover, who wins his mistress under a false name because his mother has been shut up in a lunatic asylum; an elderly country gentleman who allows his wife to be shut up because he is worried into it by his sister, who is fiercely ambitious for the honour of being his housekeeper; and a heroine who is there to fall in love with the young gentleman and into the arms of her father in the great scene of the second act are only Mr. Sims's slight modifications of the standing marks of the artificial comedy of the nineteenth century as invented by Mr. Byron. The other personages are

manifestly there to make puns. We may make an exception in favour of a naval officer who goes about on leave in his uniform, which is a mixture of that of a commander and the attire of the stage smuggler. This person hops in and out of the play in order to stammer and go up to the country gentleman's sister in order to say one thing and then say another. But it is the puns in which the strength of the piece consists—puns of the mechanical kind, which can be made in any number with patience and a dictionary. To be sure, this labour has been largely spared Mr. Sims, the majority of his puns being the common property of the baser sort of comic papers for many a day. They are one and all, new and old, of the kind which gracefully plays on the similarity of sound between heart and art.

Perhaps it is in the belief that the badness of a piece gives a larger scope to the skill of the actor that Messrs. James and Thorne accept plays of the character they have been producing for so long. If so, they may be congratulated on having done something to prove the truth of their opinion. With every desire to forget Mr. Sims's piece as completely as possible, we can remember the acting of the Vaudeville company with pleasure. Mr. Thorne will perhaps not understand our sympathy when we say that we are sorry to see so good an actor turned into a mouthpiece for bad witticisms and routine sentiments. But, whether or not, the regret was due to the contrast between the part he played and the real humour and tenderness he put into it. We would advise him, however, when he has a pun to make, not to produce it so much as if it were a pistol-shot, and then stand as if he were watching the effect. The quicker these things are done the better and the less unnatural they are. Mr. Farron acted, as he always does, with the manners and tones of a gentleman, and it is clearly not his fault if these do not suit very well with the part of Squire Hasseltine. The fooling of Mr. Lestocq as the man in possession of the Half-way House was excellent. Mrs. Cannings, in the part of Mrs. O'Shaughnessy, the Squire's sister, was venomous, as she ought to be, and well bred, for which we thank her. The part would lend itself so easily to vulgarity. Miss Alma Murray was tender and graceful as the heroine, Ivy Hope.

The "new and original poetical and historical play," in five acts, by Mr. Walter S. Raleigh, chosen by Mrs. Scott Siddons in an unguarded hour for her reappearance on the English stage, suggests some reflections on the stock lamentations over the difficulty of getting pieces by English writers produced. Like more than one which have lately triumphed over the difficulty of getting acted, *Queen and Cardinal* is very bad. Whether this is a proof that the faculty for writing plays is utterly lost in this country, or only that the judgment of the "practical man" as to what is fit for the stage is not so infallible as he commonly supposes, or both, we shall not attempt to decide. Perhaps it proves the first of these propositions better than the second; for *Queen and Cardinal* is new and original in very much the same sense that an adaptation from the French is. The only difference is that Mr. Raleigh has preferred to recast the work of one of his own countrymen. *Queen and Cardinal* is simply an attempt to re-write *Henry VIII.*, and fit it for a nineteenth-century audience, which, as a great critical authority informs us, has quite outgrown Shakespeare. Mr. Raleigh is to be praised for drawing on national sources, and the result of his efforts is highly satisfactory. He has produced a play which every member of his audience could see at once was very bad. And yet he has trodden faithfully in the steps of the adapter. He has carefully lowered the whole tone of his subject. He has put stage sentiment in the place of real passion, slovenly English where the noblest blank verse was before, and more stage effects in the place of great dramatic situations. Having had the heart to re-write Wolsey's reflections on his fall, he ends up a tirade of commonplace thus:—

No miracle for me. My course is run,  
And all my dreams must end in nothingness.  
(O God! that it should ever come to this!  
Foiled—overthrown—and by a woman, too.

This is not much worse than what has been done to many French originals in English adaptations; but we are glad to see that it is not to be done to Shakespeare with equal impunity. The acting of Mrs. Scott Siddons's company was of a kind to hasten the precipitate fall of the piece. Mr. Kemble delivered the few lines he had to give in the part of Cranmer with force and intelligence, but nothing else called for praise. Mrs. Scott Siddons acted in a noisy unemotional melodramatic style, which is fortunately now becoming old fashioned, even as an example of bad acting. Several of the other members of the company have proved competent to act in less trying plays; but they were unable to put life into Mr. Raleigh's combinations of emptiness and pretension.

Another of the very remarkable pieces called "burlesque dramas," doubtless because they burlesque nothing, and are not dramatic, has appeared at the Gaiety. *Whittington and his Cat* is the title, and the author is Mr. Burnand. The part in the authorship which really belongs to Mr. Burnand, and not to the stage carpenter or arranger of dances, is doubtless the few smart puns and cleverly absurd plays on words which disturb the general insipidity of the piece. They come up once or twice in a scene, and feebly burst like bubbles in soda-water going flat, after the manner of the jests in the conversation of Thackeray's fashionable portrait-painter. For the rest, the piece is of the kind which the Gaiety audience demands and obviously enjoys. There are plenty of brilliant dresses, and the habitual absence of dress. There is a "Polka Fantastique," a "Mouvement Cadencé," and so forth, performed

with great muscular energy, and having very much the same relation to dancing which the burlesque drama has to any known form of dramatic literature. Mr. Dallas is ignobly funny in a woman's dress, and the chorus raise their arms with the wooden grace of clockwork figures, and stiffly sway to and fro. As usual there is real low comedy in the grimaces of Mr. Royce, and real grace in the dancing of Miss Kate Vaughan.

Mr. Pinero's *Imprudence* has shown a remarkable power of attracting audiences. After a removal from the Folly to the Standard, it has stood a second change, and is being successfully played as an afternoon piece at the Imperial.

#### RACING AT SANDOWN AND NEWMARKET.

THERE is no place in England where racing can be enjoyed in greater comfort than at Sandown. To begin with, a train leaves London for Esher at mid-day, and as this train is specially reserved for members, it is unaccompanied by the objectionable mob which makes most trains bound for racecourses almost unendurable. On arriving at Esher, a pathway kept exclusively for members leads up to the race-stand, which is very prettily situated beneath a wooded hillock. Sufficient time is allowed between the arrival at Sandown and the commencement of the racing to get luncheon in the most comfortable restaurant existing on any British racecourse, and at the back of the stand is a pretty saddling paddock, where the horses about to run can be looked at without a crowd or unpleasantness of any kind. When the jockeys are mounted, they have to ride their horses down a wooded drive at the back of the stand, where there is plenty of room for spectators to take a leisurely look at them without being mobbed or fussed. The stands themselves are most comfortable, and in place of a betting ring there is a sloping lawn from which ladies as well as men can comfortably watch the races, sitting on chairs or garden seats. It is true that there is a betting ring, but it is on one side, and its occupants are safely barricaded behind formidable railings. It would be too much to say that the racing at Sandown is always of the very highest class; yet some very good horses occasionally put in an appearance; the fields are generally large, and the finishes are in many cases exciting. Although the best English jockeys ride at Sandown, in some of the races members of the Club only are allowed to ride, and these contests confined to amateur jockeys are the source of a good deal of interest and amusement. The late meeting was opened by a match, and the two competitors, who were ridden by Archer and Wood, were considered so equal that only 21 to 20 was laid on the mount of the last-named jockey; a rather pretty race, however, ended in an easy victory for Archer. A dozen horses started for the Sandown Autumn Cup, and, after a most exciting race, Spitzbergen and Frontier ran a dead-heat. In the deciding heat it appeared so close a thing that another dead-heat was anticipated, but in the last few strides Frontier swerved, and was beaten by half a length. Archer won a race on old Strathavon, who is nearly white, and another on Passaic, an American horse that formerly belonged to the owner of Iroquois. Although he had run five times this season before he won a race, he was sold at Sandown for 500*l*. In the hunters' flat race there was a clumsy piece of riding on the part of one of the amateurs; but Mr. Coventry, who rode Cortolvin, showed excellent jockeyship by the way in which he kept his horse going against its will until he had won the race. In the Juvenile Stakes Archer and Wood had another battle. Thirteen horses started, but at the distance the two famous jockeys brought out their mounts, and had it all to themselves. It was a pretty race, but Wood had the best of it, and the Rigolboche colt beat the rather undersized Bentrice by a length. After a hurdle race, in which there was a nasty fall, a Nursery Handicap, for which thirteen two-year-olds again ran, ended the day. It is melancholy to see a famous racehorse reduced to hurdle-racing; but in the first race of the second day Lord Clive, who was believed by many good judges to have been the best three-year-old of his year, not only ran in a hurdle race, but tumbled down and gave his jockey a heavy shaking. The most interesting race of the meeting was the Great Sapling Plate for two-year-olds. The favourite was Kingdom, a colt by Kingcraft that had won a race at Ascot, and had run second to Kermesse at the same meeting. The second favourite was Resin the Bow, a colt that had won several races. Almost from the start the two favourites went to the front and raced side by side; but as they drew near to the winning-post Resin the Bow passed his antagonist, and was apparently winning with some ease when he swerved across the course, and allowed Kingdom to win by a head. Out of a field of eighteen in a Nursery Handicap, a 20 to 1 outsider surprised everybody by winning in a canter by three lengths. The rest of the racing at Sandown requires no special notice.

The two days of heavy rain which intervened between Sandown and Newmarket made the prospect of the latter meeting anything but agreeable; but before Monday afternoon the rain cleared away, and, with the exception of two or three showers, the weather during the five days' racing was remarkably fine for the time of year. The great race of the first day was the Criterion, and, as the reputation of the favourite for next year's Derby depended upon it, it was an unusually interesting event. Bruce had already won three races, but his enemies maintained that in those

faces he had not been opposed by anything capable of testing the merits of a first-class two-year-old; but now he was to meet Nellie, who was but a very few pounds inferior to the three flying fillies that have been distinguishing themselves as the best two-year-olds of the season. Although Nellie was to run against Bruce at a disadvantage of 3 lbs., inclusive of her allowance for sex, she was the most fancied of the pair, and started first favourite at rather shorter odds than Bruce. Bruce made the running, closely followed by Nellie and St. Marguerite, another filly of high class, while the other five starters came on at a respectful distance in the rear. Of the three leaders, Bruce was the first to show symptoms of distress, and very soon afterwards Nellie seemed to have the best of it; but Bruce kept struggling on very gamely, while the two fillies tired in the last hundred yards, and allowed Bruce to pass them and win by a length. This performance makes Bruce on public form the best two-year-old colt of the season; but it scarcely proves him to be as good as either Kermesse, Geheimniss, or Dutch Oven. The racing on the Monday was chiefly noticeable for the large fields, for the ill-luck of the usually infallible Archer, who rode in five races without getting even a place, and for a couple of very fine races, one of which was won by Fordham on Mr. de Rothschild's Emmeline Marcia, the other by Wood on Sir G. Chetwynd's Sutler, who was bought in for 1,150 guineas after the race.

Last week we noticed the chief incidents of the Cambridgeshire. It is a curious fact that on the first occasion that 9 st. has been carried in that race by a winner, the course was at least as heavy as it had ever been on a Cambridgeshire day. This materially enhances the merit of Foxhall's victory. We may dismiss the subject by observing that the late Cambridgeshire was a particularly fine example of the art of handicapping; for two three-year-olds, handicapped at weights varying as much as 35 lbs., were within a head of each other at the finish, and another three-year-old, handicapped at an intermediate weight, was within a neck of the leading pair. The other racing on the Cambridgeshire day does not require any notice here; but we may mention the fact that the fields of the day were very good, averaging eleven starters for each of the seven races. Nor was the racing of the Wednesday of a very exciting nature. The great event of the day was the Dowhurst Plate; but even this was comparatively a tame affair. As much as three to one was laid on Dutch Oven, and she won. The only interesting feature of the race was the nearness of Marden to the winner at the finish. Dutch Oven won by a trifle more than a head, but she was giving 4 lbs., exclusive of allowance for sex, to Marden. In the July Stakes, Marden had run within half a length of Kermesse, and had beaten Dutch Oven by the same distance. At Lewes he had run within a length of the famous Geheimniss, but in two other races he had run unaccountably badly. From this it appeared that Marden was an uncertain performer; but it seemed possible to argue, from his relative form with Dutch Oven and Kermesse, from their form with Nellie, and from Nellie's form with Bruce, that, when in his best running humour, Marden might be almost as good as Bruce. In the last race of the day Geheimniss cantered in, the easiest of winners, by a length. She has now won seven consecutive races and has never yet been defeated. During the day's racing only two out of eight races were won by the first favourites, and when the favourites did win, long odds were laid on them. In two races, horses against which 10 to 1 or more had been laid were successful, and in three races 5 to 1 was laid against the winners.

There were nine races put down on the card for the Thursday. One of these was the Free Handicap Sweepstakes of 100 sovereigns each, for three-year-olds, the weights for which appear before the Derby. This handicap is very interesting at the time of its publication, as it furnishes a statement of the opinion of the official handicapper on the merits of the principal three-year-olds of the year; but the race itself is often a tame affair enough, as there are certain penalties which generally exclude the best public performers of the season, and, in consequence of the starting fee being so high, the field is usually but a small one. The favourite on this occasion was Scobell, who was carrying 8 st. 12 lbs., and he justified his position in the betting by winning, with tolerable ease, by a length. Althotas, who carried 8 st., was second. Scobell has won between seven and eight thousand pounds in stakes this season, but he must have been a source of immense losses to many of his admirers, as he was backed very heavily for the Two Thousand, the Derby, the Grand Prix de Paris, the St. Leger, and the Cambridgeshire, in neither of which races was he even placed. For the Subscription Plate, the American horse Gerald walked over. If he keeps well, we shall probably see this colt doing great things next year. On Thursday morning a gentleman gave 1,550 guineas for the two-year-old Convert, who had won several races. As he was entered for the Troy Stakes, which was to be run that afternoon, he was likely to repay some of his purchase money immediately, for the race appeared completely at his mercy. The heavy odds of 75 to 40 were laid on him; but he was beaten by a head by Actress, so that between his actual price, and the money laid on him for the Troy Stakes, he was by no means purchased for an old song.

Chippendale was a strong favourite for the Jockey Club Cup on the Friday. Exeter was the second favourite, and the least fancied of the half-dozen starters was Peter. Chippendale was beaten a long way from home, and as the leading horses came into the Dip, Corrie Roy was in front, closely pursued by Peter. There was

a fine race from this point, but Peter either could not or would not give Corrie Roy 7 lbs. more than weight for age, and the filly won by a head. It was generally considered by good judges of racing that Peter could have won if he had liked, but against this theory must be set the fact that he ran throughout the race in a far kinder fashion than is usual with him. The backers of Corrie Roy for the Cesarewitch had some cause for feelings of mortification at her withdrawal from that race three hours before the start, for the Jockey Club Cup was run over the Cesarewitch course. There were several closely contested races during the day. St. Marguerite won the Home-Bred Foal Stakes in a canter. It has been too often the fate of this clever filly to be matched against competitors just a trifle better than herself. The last race of the meeting was a match between horses belonging to Sir John Astley and Mr. Alexander, in which the first-named gentleman was victorious; and thus ended the Newmarket racing season of 1881.

## REVIEWS.

### INDIAN PRESIDENCY TOWNS.\*

A CLASSICAL scholar wishing to recall some of the lore which gave him a good place in "moderations" or "finals" will naturally turn to some of the best-known ancient authors to see how they have fared under the searching touch of modern criticism. He will take up his Virgil and Horace in preference to Valerius Flaccus or the *Periplus* of Scylax. In like manner, those who refer to Mr. Hunter's *Gazetteer* to see how India has advanced after the deluge of the Mutiny may prefer to read his account of celebrated Capitals rather than to search for obscure villages or tributaries of the Ganges, or mountainous ranges which have a rainfall of hundreds of inches in the year. In this spirit we now propose to notice Mr. Hunter's treatment of the great Presidency towns and some of the capitals of Moghul sovereignty, about which every Anglo-Indian resident, traveller, or tourist has his own opinion.

Mr. Hunter, who has assigned forty pages to the territories under the Lieutenant-Governor of Bengal, has given only fifteen to the town of Calcutta, which, all theories as to the superior advantages of Nassik, Simla, or Jubbulpore notwithstanding, is, we take it, destined, in his words, long to be "the capital of India and the seat of the Supreme Government." He disposes in a few lines of the historical events of the last century, which most Englishmen are not unreasonably supposed to remember, and he draws a parallel between the metropolis as described by writers of that age—a jumble of sordid huts and magnificent palaces—and the present city, in which the efforts of the Chief Commissioner and a municipality have reduced the annual death-rate to twenty-five in a thousand. Here we think that the author has hardly done justice to himself and his subject. He might have told us more of the disappearance of old landmarks, the evolutions of streets, and the general expansion of the town; the dates of the foundation of noble hospitals, colleges, and celebrated public buildings; the sites of statues raised by a grateful community to the successive statesmen who have built up the fabric of British empire; the era when roads, which had been constructed of bricks burnt from the Bengal clay, began to be paved with stones brought as ballast from Mauritius; or the year in which certain vast reservoirs were dug, and when elephants were first prohibited from coming within the Mahratta ditch; and many other little details which can be gathered from the writings of the late Mr. J. C. Marshman and Sir John Kaye. The former was a complete treasury of antiquarian and local lore with regard to every temple, mansion, or bathing ghaut on either bank of the Hooghly between Diamond Harbour and the French settlement of Chandernagore. The splendid view which used to charm travellers landing for the first time in a P. and O. steamer at Garden Reach is now missed by those who descend, dusty and travel-stained, from a first-class compartment at the Howrah railway terminus. It was Lord Hardinge who said on landing at Obandpal Ghaut that you must go back to Cairo to find the East, and Bishop Heber compared the view of Government House and the Esplanade to that of St. Petersburg. Since these dicta were delivered by the warrior and the prelate, means have been taken to give to Calcutta those sanitary advantages which its magnificence and importance demand. Open ditches, reeking with garbage, have been replaced by vast underground drains, at a cost of nearly three-quarters of a million. A supply of filtered water has been procured from the Hooghly, sixteen miles above Calcutta. The daily flow is estimated at six millions of gallons, allowing sixteen gallons per head for a population of about half a million. The town is now lit by gas, and other improvements in the cremation of dead Hindus and the burial of Mohammedans have diminished, though not entirely removed, the danger of fevers and cholera. But with all its fine esplanade, tidal river, and supply of pure drinking-water, Calcutta does not easily expand, and it is too contracted for the wants of its official and mercantile community. More than three miles of native bazaars and streets prevent Englishmen from building and occu-

pying houses to the north of Dalhousie (late Tank) Square. To live beyond Cossipore in that direction, or on the line of the Eastern Bengal Railway, involves for eight months in the year an amount of heat, fatigue, and exposure to which few Englishmen can submit. To the east progress is effectively barred by canals and a marsh, known to natives as Dhappamanpur and to Anglo-Indians as the Salt-water Lake; and this ineligible spot is rapidly being filled up by deposits of silt and sewage. To the south of the Esplanade, a series of dense gardens and hamlets ends after a few miles in a rice swamp of gigantic dimensions, and more than one-half of the once favourite suburb of Garden Reach has been occupied by the ex-King of Oudh, his menagerie, pigeons, aquatic birds, and dissolute retainers. Howrah, on the right bank of the Hooghly, is now, it is true, connected with Calcutta by a fine floating bridge, which has hitherto bid defiance to cyclones. But there is little space for building in such a suburb—"differtum nautis cauponibus atque malignis"—and some of the best houses in Chouringhi, where Chief Justices and members of Council once dispensed a graceful hospitality, have been converted into boarding-houses in which married couples can be lodged and fed, in flats, at so much per head a month.

Mr. Hunter gives us slight sketches of the suburbs of Calcutta under their alphabetical headings; but here we notice some omissions, as well as what we think errors of antiquarian research. He mentions the lunatic asylum at Bhowanipore, but why does he omit all reference to the London Missionary Society? In his review of the cyclones he takes no notice of the great gale of June 1842 and that of May 1852, nor of one in the last century, about 1737, which blew down the tower of the old church. Again, we find Cox's Bazar, a subdivision and police circle far away in the district of Chittagong; but why leave out Cox's Bangulow, long the well-known half-way house between Barrackpore and Calcutta, where the hounds used to throw off regularly once a week from November to February, as the distant and random gun was fired from the cantonment of Dum Dum? It is incorrect, we think, to represent the celebrated duel between Francis and Hastings as having taken place near a large tree on the Maidan, not far from the racecourse, on the Esplanade of Calcutta. We have long heard on better authority than mere tradition that this encounter took place in the grounds attached to the large house on the west side of the Alipore road passing by the Lieutenant-Governor's residence of Belvidere, and not very far from what was the European Orphan Asylum. Indeed, though the old jurisdiction of the Supreme Court extended to Englishmen resident out of Calcutta and in the Provinces, it was usual for duellists to fight outside the limits of the city, for the most obvious reasons. We remember several duels fought in Bengal before the custom died out, and only one took place on the Esplanade. The scene of the last was Seraimpore, Barrackpore, and the alluvial formation on the Howrah side of the river. We think, too, that within the last twenty-five years the thermometer in the early mornings of the cold weather has been registered below 52° in Calcutta, or certainly in Garden Reach.

No greater contrast can be imagined than what is presented by the view of the cities of Calcutta and Bombay. If the former derives its name from Kali Ghat, the latter, in all probability, is a corruption, through the Portuguese Mombaim, of Mumba-Devi, a local deity. We transcribe Mr. Hunter's picturesque language in preference to our own, descriptive of Bombay:—

In the beauty of its scenery, as well as in the commercial advantages of its position, Bombay is unsurpassed by any of the cities of the East. . . . The approach from the sea reveals a magnificent panorama. The distance is closed by the barrier range of the Western Ghats. In front opens the wide harbour, studded with islands and jutting precipices, dotted with the white sails of innumerable native craft, and giving a secure shelter to fleets of tall merchantmen. The city itself consists of well-built houses and broad streets ennobled by public buildings. The sea-shore is formed by docks, warehouses, and a long line of artificial embankments extending continuously for nearly five miles.

Mr. Hunter passes with too light a touch over the discreditable mercenary epidemic which affected all classes of the community, including even some of the Civil Service, in 1864-65. The crash that ensued when the price of cotton fell after the end of the American war was what might have been expected when two millions of cash were expected to do the work of Companies and Associations requiring for success just ten times that sum. In improvements Bombay rivals and perhaps surpasses Calcutta. Omnibuses now ply between Bhendi Bazar and the Fort, which is a defence only in name. The crumbling ramparts that only excluded the sea air, and could not have kept out an enemy for half an hour, have been removed. Government offices, banks, mercantile establishments are situated within the area of the Fort, somewhat the same as at Madras. Of the Presidencies Calcutta is the only one where the Fort retains its martial appearance, or could be in any emergency a real protection to the inhabitants. The houses inhabited by Englishmen at Mazgaon and on Malabar Hill at Bombay are spacious and comfortable, though the latter site, exposed to the fury of the south-west monsoon, is literally uninhabitable from June to September. One of the most curious local misnomers is that of Back Bay. Any one would imagine that this spot must be looked for somewhere between the island and the mainland. It forms, on the contrary, the sea front between Malabar Point and the suburb of Colaba. It may be very shallow, but it has to bear all the rage of the Indian Ocean. Some years ago it was the fashion for all the magnates of the island to leave their comfortable houses and occupy tents on the shore of Back Bay from the 1st of November to the beginning of the hot weather. This habit involved several of the dis-

\* *The Imperial Gazetteer of India*. By W. W. Hunter, C.I.E., LL.D., Director-General of Statistics to the Government of India. 9 vols. London: Trübner & Co. 1881.

comforts of living under canvas without the compensation of constant change of scene, rural scenery, and the sporting excursions with which an Anglo-Indian camp is generally associated. Panegyric can scarcely exaggerate the convenience and amplitude of the harbour of Bombay. It could afford anchorage for the whole British navy, and it is spacious enough to allow yachts to remain becalmed towards nightfall at some miles distant from the pier. We note, by the way, that, though called the Apollo Bunder, this landing-place is said to derive its name from the Palwa fish. We find no mention anywhere by Mr. Hunter of the famous "Towers of Silence," though full justice is done to the public spirit, loyalty, and intelligence of the Parsis, as well as to the varieties of national type to be met with in the bazaars and streets.

The town of Madras has, we may remind some readers, neither the fine harbour of Bombay nor the flowing river of Calcutta. Indeed, from False Point to Adam's Bridge, the whole of that coast possesses no harbour worthy of the name. The first view of Madras from the roadside is disappointing, and the landing is made difficult by the celebrated Madras surf. There has been a talk about a breakwater on the model of that of Plymouth, and a pier has been constructed, to be twice seriously damaged by the collision of vessels drifting in a storm. A harbour of moderate size is now under construction. The city, says Mr. Hunter, is spread over a much larger area than Calcutta or Bombay. The native suburbs are numerous, and there is no period of the year which by strained courtesy can be termed the cold weather. But divers stations in the hills are easily reached; the water supply is abundant; railways run south and west; and there are horticultural gardens and people's parks. The population, after several random estimates, is set down at about 400,000 souls.

We turn from these cities, mainly created by Englishmen, to the old capital of Akbar. The period of its splendour fills just one century. Akbar completed the fort at Agra, began to adorn it with lovely mosques and palaces, and lies buried in a tomb worthy of his fame and character at Secundra, four miles from the city. His son Jehangir had no great fancy for this place, and it was reserved for his successor, Shah Jehan, to complete the structures commenced by his grandfather, and to eclipse all that Mohammedan sovereigns or architects had devised by the exquisite Taj Mahal. In the last century the fort was several times besieged and taken, but it never became the seat of Anglo-Indian government until 1835. Then, with that whimsical uncertainty which characterizes our selection of important sites, the capital of the North-West Provinces was whisked away to Agra from Allahabad, to which latter place, as being central and on the main line of rail, it has again been brought back. Mr. Hunter sums up the beauties of the Taj Mahal in half a page of accurate and graceful description, which travellers should be careful to read and weigh on the spot. A commercial future is anticipated for this old capital. It has always been a native mart for grain and sugar, and it will soon be the centre to which several lines of railway will converge. Its population is about one hundred and fifty thousand souls, and it is one of the driest, dustiest, and hottest cities under our rule. Agra should be visited after Lucknow by persons who do not wish their taste to be highly offended. Oudh is a magnificent province containing eleven millions of inhabitants, and Lucknow has nearly double the population of Agra. In an historical point of view the defence of Lucknow will always rivet attention as a focus and a turning-point in the Sepoy Mutiny, and will leave Agra far behind. A large number of Englishmen and Englishwomen did certainly hold this last fort all through the eventful summer of 1857, endured manifold inconveniences, and displayed a great deal of pluck. But in the nature of things there could be nothing highly heroic in their attitude, and their ultimate deliverance by General Greathead's column, after the fall of Delhi, was as much a surprise to the defenders themselves as to the mutineers from Gwalior. But if architecture there is no parallel between Agra and Lucknow. With the exceptions of the Imambara—said to be equal in size to the mosque of St. Sophia at Constantinople—of a fine old gateway known as the Rumi Darwaza, and of one or two other buildings, the architecture of Lucknow is tawdry and debased. The gardens, summer-houses, and palaces built in succession by one royal spendthrift after another for wives, concubines, and menageries of wild beasts, are exact types of the characters of their silly designers and builders. Yet it is astonishing what an amount of false sympathy was evoked by the dethronement of the last of an incorrigible dynasty which we had ourselves set up. It is gratifying to learn that charitable dispensaries, schools, and "other works of public utility" have succeeded to statues of green mermaids, domes of copper gilt, burnished umbrellas, and unfinished tombs and mosques. We note also that a capacious hospital, with beds for one hundred patients, has been established on a plot of high ground near the Residency by the Maharaja of Bulrampore, Sir Dig Bijai Singh, one of the most loyal, practical, and intelligent of the Talookdars of Oudh. He is as good a sportsman as he is a landlord and subject.

Into five pages Mr. Hunter has managed to compress a great deal of information about Benares, where according to a Sanskrit couplet, a Hindu may die, in security of bliss, whether on dry land or in the water. A more correct census has dissipated false notions that the population of this Hindu city varied from 300,000 to 500,000. The Census of 1872 gave the return under 200,000. No visitor to this sacred place will forget to walk through its crowded bazaars during the afternoon or evening,

and to row down the Ganges in the early morning, when the inhabitants turn out in successive batches to bathe. Benares used to be noticed as the lowest station in the Upper Provinces where ice could be manufactured by a simple process of evaporation when the thermometer was above freezing point. For Hindu customs and antiquities, the work of the Rev. Mr. Sherring should be consulted. Mr. Hunter says nothing about the colony of Hindus from Lower Bengal, who, to the number of several thousands, inhabit a part of this city, and have a press, a Society, and a newspaper of their own. We reserve for a future occasion all notice of topics less familiar than the cities associated with the rivalry of Hindus and Buddhists, with the splendour of Mohammedan sovereigns, and with the commerce and conquests of adventurous Englishmen.

#### DARWIN ON THE ACTION OF WORMS.\*

MR. DARWIN'S little volume on the habits and instincts of earth-worms is no less marked than the earlier or more elaborate efforts of his genius by freshness of observation, unflinching power of interpreting and correlating facts, and logical vigour in generalizing upon them. The width of his sympathies with nature is not bounded by the limits which conventional taste or inherited prejudice too often assigns to the study of natural objects. It is not because such and such forms of life are rare or beautiful, complex or exotic, that they kindle his enthusiasm or keep his attention on the stretch by day and night. None has proved too humble or too repulsive in popular estimate to awaken his interest and concentrate his powers of observation. In the economy of life nothing is common or unclean to one who has learnt to view nature as a whole—various in function, but uniform in structure and design. In what is popularly thought the lowest grade of life it may be shown that there is a use, an adaptation to ends, and a resulting beauty which may reverse the verdict of vulgar prejudice. Animals even more lowly organized than the worm—namely, corals—have built up reefs, islands, and continents from the bod of the ocean, as Mr. Darwin was the first adequately to recognize and to explain. He now comes before us to do justice to an order of toilers far more despised, and even cast out as evil. In point of structure the worm, as he shows us, presents an interesting object of study. In its intelligence it holds no mean rank among living creatures, and in its labours are involved results which it behoves us to look upon with wonder and gratitude. The main purpose of Mr. Darwin's work is to point out the share which worms have taken in the formation of the layer of vegetable mould which covers the whole surface of the land in every moderately humid country. Though it may rest upon various subsoils, and differs but little in its general aspect—being for the most part blackish in colour and having but a few inches of thickness—one of its chief characteristics is the fineness of the particles of which this mould is composed, and this is to be seen whenever a field long undisturbed is freshly turned up by the plough. Now, although of the highest antiquity, viewed as a whole, yet, as regards permanence, the component particles of this superficial structure of earth have been all along in process of removal at a rate by no means tardy, being replaced by others due to the disintegration of the underlying materials. Nature's ploughman, the earth-worm, has been for ages at his humble but beneficent work.

As early as the year 1837 a paper was read by Mr. Darwin before the Geological Society of London, in which it was shown that small fragments of burnt marl, cinders, &c., which had been thickly strewn over the surface of several meadows, were found after a few years buried in a layer some inches beneath the turf. On the suggestion of a friend, Mr. Wedgwood, of Maer Hall, Staffordshire, that this apparent sinking was due to the large quantity of fine earth continually brought to the surface by worms in the form of castings, he was led to institute experiments which convinced him that all the vegetable mould over the whole country has passed many times through, and will yet over and over again pass through, the intestinal canals of worms. Hence, he infers, the term animal mould would be in many respects more appropriate than that of vegetable mould. His observations during later years, kept up with his characteristic patience and acumen, aided by the suggestions of friends and fellow-students of nature, are embodied in the interesting monograph before us.

The anatomical structure of this widespread, familiar, yet rarely scrutinized order of annelids (illustrated in fig. 1) shows the adaptation of the worm to its life-long task of burrowing. The liason body is made up of from 100 to 200 almost cylindrical rings or segments, each furnished with minute bristles. Having a well-developed muscular system, worms can, by contact with the surrounding earth, crawl or work themselves backwards as well as forwards, and by the aid of their affixed tails can retreat with extraordinary rapidity into their burrows. At the anterior end of the body is seen the mouth, provided with a slight projection known as the lobe or lip, which is used for prehension. Internally behind the mouth there is a strong pharynx, which is pushed forward when the animal eats, corresponding, according to Perrier, with the protrudable trunk or proboscis of other annelids. The pharynx leads into the oesophagus, which has on each side of the lower part three pairs of large glands capable of secreting a

\* *The Formation of Vegetable Mould through the Action of Worms, with Observations on their Habits.* By Charles Darwin, LL.D., F.R.S. With Illustrations. London: John Murray. 1881.

surprising quantity of carbonate of lime. Nothing corresponding to these calciferous glands is known in any other animal. The oesophagus is enlarged in most species into a crop, behind which comes the gizzard, lined with a smooth, thick, chitinous membrane, and surrounded by muscles, weak lengthways, but powerful transversely. By the action of these muscles the food must be triturated, since the worm possesses no jaws or teeth of any kind. In the gizzard and intestines are to be found grains of sand and small stones from 0.1 to 0.05 inch in diameter, which serve, as is the case with fowls, like millstones for the trituration of food. From the gizzard the intestine runs in a straight course to the vent at the posterior end of the body, presenting the remarkable structure of the typhlosis, known to the old anatomists as an intestine within the intestine, consisting, as Claparède has shown, of a deep longitudinal involution of the walls of that organ, by means of which an extensive absorbent surface is gained. Worms breathe through their skin, having no special respiratory organs. Both the circulatory and nervous systems are well developed, and close to the anterior end of the body lie the two almost confluent cerebral ganglia. Although wholly without eyes, it has been found by Hoffmeister and other observers that worms are in general highly sensitive to light, and Mr. Darwin's experiments have strongly confirmed him in this view. The colour of light made no apparent difference, nor were the worms much affected by a sudden or moderate light, the effect being in proportion to its intensity and duration. It is only the anterior extremity of the body, the seat of the cerebral ganglia, which seems affected by it; no effect being produced, though the rest of the body be illuminated, if only this part is shaded. It is through the skin that we must suppose the light to pass and excite the cerebral ganglia; but by no particular difference in the transparency of the skin or in the incidence of the light could Mr. Darwin account for the various ways in which the worms were affected on different occasions. Their action in dashing rabbit-like into their burrows when suddenly illuminated might be looked upon as simply reflex or automatic, the irritation of the cerebral ganglia causing certain muscles to contract independently of the will or consciousness of the animal; but the insensibility of the worm on occasions when its attention seems absorbed in work would point to the possession of a mind comparable in kind, if not in degree, to that of animals higher in the scale of intelligence. Their sensitiveness to light certainly suffices for them to distinguish between day and night, enabling them to choose the night hours for burrowing to the surface, thus escaping many a danger from the diurnal animals that prey upon worms. They appear less sensitive to moderate radiant heat, judging from the effect of a poker heated to dull redness; but a low temperature immediately tells upon them, as may be inferred from their retiring into their burrows during frost. That they equally withdraw during heat may be more directly traceable to the effect of drought, humidity being the first condition of the worm's active work. They show not the slightest sense of hearing, yet are sensitive to vibrations in solid bodies, remaining perfectly unmoved when placed in their pots within a short distance while both high and low notes were loudly struck upon the piano, but rapidly burying themselves when the pots were set upon the vibrating frame of the instrument or were sharply struck. The least current of air, as of the breath, shows how sensitive the worm's whole body is to contact. The senses of smell seems to be feeble and confined to certain odours presumably connected with its food. Tobacco, millefleurs, and paraffin were tried by Mr. Darwin, with no perceptible effect; acetic acid made the worms seem rather uneasy, but this was probably due to the irritation of their skins. Cabbage leaves and bits of onion had a more lively effect, being always discovered when buried a quarter of an inch or so beneath the surface, while scraps of fresh raw meat, of which worms are very fond, remained undetected forty-eight hours, not having become putrid. Though they have their favourite food, which our author tested by manifold experiments, worms are practically omnivorous. Besides decayed leaves of all kinds, their chief diet seems to consist of earth, of which they swallow an enormous quantity, extracting from it whatever digestible matter it may contain, and secreting the residue in the form of the fine mould familiar to us as the worm cast. It is probable that the calciferous glands greatly help in the process of digestion, especially where the worms live over chalky soil, the concretions of lime in the intestine serving moreover to neutralize the acetic acid from decaying leaves.

Carefully watching their habits by night and day, Mr. Darwin has set down a number of interesting particulars as to the way in which worms discriminate and seize their food, excavate their burrows, line and plug them with leaves, or pave them with little stones or seeds. Their instinct is shown in the way they grasp a leaf by its tip rather than by the base or foot-stalk, even in the case of exotic plants, of which neither they nor their progenitors could know anything. Small triangles of paper were found to act similarly as tests of intelligence, 62 per cent. being drawn in by the apex—which independent trials proved to be the way of least resistance—15 per cent. by the middle, and 23 per cent. by the base. When kept in a warm room they were found to work more carelessly, dropping or loosely dragging the triangles—a sad proof of demoralisation. The rate at which worms burrow is too various to be easily reduced to measure, some burying themselves in a pot of loose mould in two or three minutes, others taking 15 or 40 minutes, without apparently swallowing any earth, whilst a large worm was 25 hours 40 minutes in burying itself in ferruginous sand, swallow-

ing and evicting large quantities of it. That worms swallow earth more for the sake of nutriment than of making their burrows, though doubted by so high an authority as Claparède, Mr. Darwin considers to be proved by the analysis of castings. A tower-like casting from Nice, photographed life-size, 3.3 inches high, voided probably by a species of *Perichæta*, hollow in the middle, through which the worm must have ascended to eject the earth it had swallowed, showed no signs of a leaf having been drawn in, the organic matter in the earth itself having supplied all necessary food. Similar results were obtained from castings from the Botanic Garden, Calcutta, and from the Nilgiris, one (fig. 4) weighing over a quarter of a pound, the worms measuring 12 or 15 inches in length, and in thickness a man's little finger. With slight generic differences, worms are found at work over nearly all parts of the world alike, in Iceland and Tahiti, in the West Indies and New Caledonia, even in islands isolated and barren as Kerguelen Land, where not even a land bird is to be seen.

The interest of Mr. Darwin's researches culminates in the estimate he proceeds to make of the amount of work brought about by the continual labour of earth-worms, and the effects thereby produced upon the surface of the soil. From careful measurements of the weight of earth ejected from a single burrow and from a number of burrows within a given space, he has come to results which strikingly show the important part played by these seemingly insignificant agents in the economy of nature. In a field near Nice the castings within one square foot of surface were found to weigh 12 ozs. a year, equivalent to 14.58 tons per acre. Upon a chalk down in Kent 33.47 lbs. were accumulated in a square yard, equal to 18.12 tons per acre. Near Leith Hill, Surrey, the yield was calculated at 7.56 tons annually on one piece of land, and 16.1 tons on another. If uniformly spread out over the surface, the castings ejected would amount, Mr. Darwin estimates from a number of instances, to a thickness of about 1½ inch in ten years. The number of worms to be met with in an acre of garden land has been estimated by Hensen at 53,767; but, taking half this amount as the yield of average land, it may be inferred that each worm ejects some 20 ozs. a year in about the same number of castings. Considering that many a burrow extends to three, four, or even five feet in depth, it is easy to conceive the amount of change perpetually going on in the distribution of subsoil, fresh and virgin mould being brought up by these untiring miners to renew and fertilize the upper earth. At the same time they carry on the process of burying objects resting on the surface—stones, bricks, and other debris sinking to all appearance with the lapse of time; the fact being that the worm-casts are heaped up alongside and over them till they become entirely hidden from view. Instances are given of great stones, the apparent sinking of which has been measured. One which had lain in a grass field for thirty-five years had been buried to the extent of 1½ inch below the original surface, another larger stone about 2 inches, the mould rising to several inches higher against the sides of the stone from the fact of the worms working under it having to eject their castings clear of the under surface, and thus piling them to a height above the average level. A sloping field near Mr. Darwin's house had been so thickly covered with flints great and small as to be called "the stony field." As his sons ran down the field the stones clattered together. In thirty years they had been so thoroughly buried that a horse could gallop from one end of the field to another and not strike with his shoes a single stone. A flagged path was similarly covered up in about the same space of time. A layer of coal ashes strewn upon the surface was found in a distinctly marked line, within eighteen years, 7 inches under the soil. In New Zealand there was found, from 3 to 6 inches underground, a layer of rude weapons and implements, flakes and chips of basalt, dropped by the aborigines upon the surface. Farmers are wont to speak of lime, cinders, and heavy stones "working themselves downwards"; and Mr. Darwin throws out a hint for surveyors as to the possibility of their "bench stones" set in the ground to mark the levels being turned by the undermining of worms into false standards.

Still more curious are the results indicated by remains of ancient buildings. The floors and walls of Roman villas at Abinger, Ohedworth, Silchester, and Brading, penetrated and buried by worm casts, form an excellent index to the rate of accumulation. Pavements have been lowered by the gradual withdrawal of the underlying soil. At Silchester the centre tesserae are found 5½ inches below the line where those at the sides of the apartments join the wall, being thereby kept from subsiding. The ponderous trilithons of Stonehenge have undergone for ages the process of slow interment by the accumulation of mould around them, at the same time that they are in danger of tottering and falling from being undermined by these tiny assailants. On the other hand, we are often indebted to them for the preservation of coins, weapons and ornaments of metal and stone, and relics of all kinds. Archaeologists are reminded by Mr. Darwin of what they owe to the despised earth-worm. The agriculturist, the lover of the picturesque, the economical philosopher, the practical statesman, may join in grateful acknowledgment of services which have so largely helped to clothe the earth with richness and beauty. All lovers of nature, we may add, will unite in thanking Mr. Darwin for the new and interesting light he has thrown upon a subject so long overlooked, yet so full of interest and instruction, as the structure and the labours of the earth-worm.

## OUR RIDE THROUGH ASIA MINOR.\*

THIS book has many faults, and yet, in spite of them, we have found it, on the whole, lively and interesting. It certainly takes us over country with much of which we had already been familiar through the travels of Mr. Davis, the English chaplain at Alexandria. Nevertheless, accurate as was his observation and minute as was his description, we have been glad to refresh our recollection of such interesting scenes in Mrs. Scott-Stevenson's pages; while, as her travels took in a large tract which he did not cross, we find much that has the charm of novelty. We could wish, however, that she had cut down her book by at least one-fifth. It is too long—a good deal too long. Publishers would do well were they each to keep a literary pruner, as it were, who should with an unsparing hand lop away all that is superfluous. Writers of travels would thereby be taught that their business is to tell what they have seen, and not to hash up what they have read. Because a man—or a woman for the matter of that—spends a few weeks in Asia, he is not the better fitted for making an abstract of all the learning of the East. Our author, for instance, goes to Tarsus, and therefore she seems to think that she has something fresh to tell us about St. Paul. From St. Paul's birthplace she gets by an easy transition to Rome, where the tradition is that he suffered martyrdom. She next tells us that it is believed that he died by the sword. This leads her to inform her readers that "decapitation by the axe was the usual mode of inflicting capital punishment on a Roman citizen; but in A.D. 66, during the reign of Nero, death by the sword was more common." We ought to be thankful that she is not led on to tell us where axes and swords were manufactured in the first century of our era. She comes to a village which "Mr. Davis," she writes, "thinks was very probably the site of Lystra." She at once assumes that it was the site, describes how the Apostle healed the cripple there, and in a footnote adds, "Paul, the sacred record teaches us, was taken for Mercury because he was the chief speaker." Because she has gone to Asia Minor, and has seen a village which another traveller thinks was very probably the site of Lystra, have all we who have stayed at home lost our copies of the sacred record? Unfortunately for the reader, it was not only St. Paul who rendered Tarsus famous. "It possessed," says our author, "one of the three great Universities of the world." Here a footnote might well have been added to show us in what sense she uses the term *University*. The town gives, indeed, an opportunity for a great display of learning, for in less than a page we find dragged in Sardanapalus, Nereus and Alexander, Frederick Barbarossa, Antony and Cleopatra, Julius Cæsar, Hadrian, Augustus, Pompey, Justinian, Haroun-al-Raschid, his son El Mamoun, and Bayazid II. In one passage we read how our author and her husband carried off from a ruin some fragments of ancient blue tiling, which likely enough are now adorning the sides of her hearth. We were reminded of the fragments of old learning with which modern travellers so often adorn their books. In one place the information that she gives is singularly confusing. She has it, she says, from an American missionary, but we would gladly believe that it has suffered in the transmission. "Mr. Farnsworth," she writes, "kindly gave me the following dates. An Arabic inscription on the tomb of Honant proves it to have been erected in 635 of the Hegira (1238 of our year the Crusades)." Does our author or her informant believe that there was only one Crusade, and that it lasted just one year? It would seem so; but yet it is not easy to think that such ignorance exists. We are all of us, however, as we ought to remember, too easily amazed when we discover that another person does not know a fact with which we have been long familiar. Thus Mrs. Scott-Stevenson, in writing of "Colonel Briscoe of the Turkish Cendarmerie," says, "As nearly every one knows, he was formerly in the 15th Hussars, and is now acting A.D.C. to Said Pasha, who is very fond of him, indeed Colonel Briscoe always lives with his chief." We will deal fairly and openly with our author. We are astonished, as we have said, at finding out that she knows nothing of the Crusades, but she shall have her triumph over us in return. We are ignorant of what not only she, but nearly every one, knows. We never knew that Colonel Briscoe was in the 15th Hussars; nor had Said Pasha's fondness for him reached our ears, though it had gone to the length of making the acting A.D.C. live with his chief in his house at Aleppo.

Some part of the interest of the book is certainly due to the utter ignorance of the country with which the author started on her travels. She brings thereby a fresher mind to all that she sees, and she describes much that a better-read traveller might pass over in silence. It is true that she too often records what must be known to any one who is familiar with even a volume or two of Eastern travels; but, on the other hand, her descriptions have at all events the merit of liveliness, while we may safely assume that most of her readers will be as ignorant of Anatolia as she herself was in the spring of last year. She had "expected to find at least a tolerable inn" in the first small town in Syria to which she came, and was, with the rest of her party, utterly ignorant of the nature of a *khan*. Yet it is nearly two hundred years ago that Maundrell warned travellers that in this country "a man does not meet with a market-town and inns every night as in England," but will only find "certain public lodgments called by the Turks *khanes*, where you must expect nothing generally but bare walls."

Whatever may have been our author's surprise, she was not in the least discouraged by the want of accommodation. Indeed we must do her the justice to admit that she has one admirable quality in a traveller and in a narrator of travels—she makes the best of everything, and scarcely grumbles. She thoroughly enjoys the country fare on which she lived for many a week, though it was only twice that she had any meat. The travellers had, indeed, taken with them some tins of preserved meat, but they neglected them for the homely fare of bread, eggs, and milk. Fresh meat was scarcely to be had, and they never missed it. Her lodgings were often of the rudest; but the weariness brought on by the fatigues of the daily ride made even the rudest lodgings welcome. In fact, she keeps herself and her reader in good humour almost from the beginning of the book to the end; and even if she does vex us now and then by her learning, yet we try to remember how patiently she bore long rides on stumbling horses and in jolting carts.

Like all other honest travellers in Asia Minor, Mrs. Scott-Stevenson raises in us a feeling of anger against the Turkish rulers who have ruined so noble a land, and of pity for the sufferings of the Turkish peasantry under the rapacious Pashas who one after the other come from Constantinople to prey upon those who are as industrious as they are helpless and weak. Our author is an impartial witness. Her sympathies are all with Turkey, while her hatred of Russia goes almost beyond bounds. We are not at all surprised that the Russian Consul of Aleppo—a wary diplomatist, as she calls him—tried, as she says, "to find out the real reason of our travelling in Asia Minor." Her husband is an officer in the army, at present serving as one of the Civil Commissioners in Cyprus. "He," she writes, "often speaks of Asia Minor as the 'future recruiting-ground' of England; for its sturdy peasants and brave mountaineers are ready and willing to meet our common foe. And it is here, in all probability, that we shall again encounter that incarnation of organized hypocrisy and injustice, of brute force and cruelty—the Russian Government, and the Russian people." One day in their travels a young Turcoman asked Captain Scott-Stevenson whether he would let him serve under him should he go to Cyprus. "Andrew [the Captain] put to him the two questions he asks every man who applies to him for enlistment—first, if he was willing to serve the Queen; then, if he was ready to fight the Russians. 'Evet, evet' (Yes, yes), he called out enthusiastically." Her friendly feelings towards the Turks are as strong as her hatred of the Russians. She praises their patience, their politeness, their kindness, their hospitality. She draws a contrast, and it is a strong one, between them on the one hand, and the Armenians and Circassians on the other, and it is always in favour of the Turks. The Armenians grudged the travellers food, even sometimes altogether refused to supply any for liberal payment. The Turkish peasants gave what they had, and often would accept nothing in return. One day she came to a little village, and asked for food. "In a few minutes men and women arrived with bowls of buffalo milk, boiled eggs, fried eggs, butter, bread, and coffee; and so soon as the plate of food was put in the arabs [cart], would run away, so as to prevent payment being offered. . . . I was most anxious to pay them, but they refused to accept anything, and said strangers were always welcome." From the Pashas and others in authority the travellers met with the greatest kindness, courtesy, and hospitality. "I feel," the author writes, "a sort of repugnance in saying anything against the governors, as though it were almost a want of gratitude in me to do so. Yet the truth compels me to state that I do not believe we met one honest or capable leader in the whole country we passed through." The ruins of temples, theatres, roads, bridges, aqueducts, and vast cities would show, if all written record were wanting, how flourishing this land had once been. It is now not merely a country full of ruins, it is one great ruin itself. Vast tracks that might support a teeming population lie untilled and waste. In one way it is even in a worse state than it was before man first set foot on it; for the forests have been cut down or fired. As they disappear drought takes their place. Oppression of the rulers has done one part of the work, their neglect another, and the brigands a third. The travellers for eight days rode over plains so fertile that, writes our author, "one would think there was enough pasture to feed the whole of Asia. As it was, they were quite deserted, except by a few small tribes of wandering Bedouins or Turcomans." Later on their path led them "through parklike scenery, fine firs and huge arbutus trees. . . The prickly oak, the plane, the birch, or a tree like it, bordered the narrow path." The only living things they saw "in the vast solitude round us" were tortoises. No care was taken to repair the bridges, to mend the roads, or even to keep them from being wantonly ruined. In many places they found them cut through by a watercourse that a neighbouring farmer had dug. Till the travellers had shovelled back the earth they could not get their cart over the ditch. In other places pits for storing corn are dug in the very centre of the roadway. When sowing-time comes round and the grain is removed, no care is taken to fill the pit. "A pickaxe is almost a necessity in driving near these villages. Without one we could not have got the arabs over." In many places the ancient road had disappeared. "It is surely a scandalous thing," our author indignantly writes at the end of a hard day's travelling, "that the second greatest town in the eastern part of the Turkish Empire should actually be without a road either to enter it or leave it. In another passage she says that "no attempt is ever made to fill up the ruts or to repair the old causeways; and the consequence is that most of the towns are unapproachable except on foot."

\* *Our Ride through Asia Minor.* By Mrs. Scott-Stevenson, Author of "Our Home in Cyprus." With Map. London: Chapman & Hall, Limited. 1881.

She pleasantly adds, "In one sense Asia Minor is truly a free country; every man seems to do just what he likes with the land. He may cut down trees, turn watercourses, destroy the roads, build shanties, and do, in fact, whatever he chooses." It was from the little port of Killindryeh that the travellers sailed on their return to Cyprus. "The inhabitants complained bitterly because the broken bridge across the river had never been repaired; declaring that, were it made serviceable, their little town and harbour would be the most thriving along the coast." In this opinion our author shares, so well is the town situated for the inland trade. In a footnote she adds, "One cannot fail to see that absolutely *nothing*" (the italics are hers) "is done to increase the trade or secure the prosperity of the people." The result is what we might expect. "Throughout the heart of Asia Minor," she writes, "we have been struck by this want of population. Every town is more than half in ruins, simply because there are not people enough to occupy the houses and keep them in repair."

We have dwelt chiefly on one side of this work. It has, however, another and a brighter side, on which we have not left ourselves space to do more than touch. The narrative is full of incidents and even of adventures. A journey of several weeks through so wild a land was not without its dangers, and the risks that the travellers ran were more than once really great. On one occasion Captain Scott-Stevenson found it high time to use his fists "after the manner of his preceptor, Mr. Jem Mace. . . . In a moment the blue, the green, the yellow gowns went flying in all directions." On other occasions it seemed only too likely that, to save his life and his wife's life too, he would have to use far more deadly weapons than his hands. The descriptions of the scenery are for the most part pretty enough, though now and then our author does fall away into fine writing. Her book, however, deserves this high praise. No one can read it without casting at least one longing look Eastwards, and uttering the wish that it may some day or other fall to his lot to see with his own eyes that famous and most noble land wherein, in spite of all that its rulers have done to work its ruin, so rare a beauty still lingers.

#### FRENCH DRAMATISTS OF THE NINETEENTH CENTURY.\*

MR. BRANDER MATTHEWS'S volume on the French dramatists of the present century is likely to be welcomed by the increasing number of people interested in dramatic literature, both on account of its subject and because it presents to English readers the views on this subject of an American writer of experience. There will probably be many dissentients from a great deal of what he has to say; and this, it may be said, is inherent in the very nature of a work dealing with matters as to which, beyond certain limits, there cannot but be room for endless variety of opinion. It is, for instance, as open to Mr. Matthews to say in his preface that the French "have done better work in the drama than in any other department of literature," or of Alfred de Musset that he "was a dramatist only secondarily, and, so to speak, by accident," as it is to him to follow later on in M. Zola's footsteps by speaking somewhat slightly of M. Victor Hugo's dramatic powers. One curious point in the book, it may here be noted, is that it shows throughout an increasing tendency to believe in M. Zola's critical faculty; and this is the more remarkable in the chapter devoted to M. Victor Hugo, inasmuch as its end seems oddly and unfortunately at variance with its beginning. But, before going into these matters, it may be not amiss to give some idea of the object of the book. This is "to give an outline of the course of the drama in France from the first quarter of this century to the present time." It is certainly odd to find at starting that in such a scheme such a writer as Alfred de Musset should be "passed with but casual attention"; but, when this allowance has been made—and it must be admitted to be a considerable one—the volume will be found to contain a good deal of information which will be useful to those who approach the subject as a new one, and a good deal of critical writing which perhaps may not lose in interest from the fact that one often finds oneself unable to accept the author's views.

Mr. Matthews prefixes to his volume "a brief chronology of the French Drama in the Nineteenth Century." In this the preface prepares us to some extent for finding not a single work of Alfred de Musset mentioned, although the date of his birth is given; and apart from this the work is carefully compiled, and may be found useful for reference. The writer then gives a slight sketch of the Romantic Movement, and follows it by the chapter referred to on M. Victor Hugo, which contains certain statements that strike us with some surprise. In speaking of *Hernani*, for instance, Mr. Matthews is no doubt right in saying that the metre of the play is "handed by a master of verse," but he is, it seems to us, equally wrong in describing the rhymed Alexandrine as "lumbering and jingling." This is, however, less odd than the subsequent assertion that "when Hugo drops verse he gives up a great advantage. His plays in verse may pass for poetic dramas; but his plays in prose are of a truth prosaic." As if to make this startling assertion yet more startling, Mr. Matthews goes on to support it by reference to *Lucrece Borgia*, and puts a climax to what he has said by telling his readers that M. Hugo's *Lucrece* "arouses the latent instinct of caricature when, in the

first act, she tries special pleading for herself, and lays the blame and the burden of her sins on her family—'It is the example of my family which has misled me'—one involuntarily recalls the fair Greek heroine of the *Belle Hélène*, who complains of 'the fatality which weighs upon me.' After this it is comparatively not surprising to find that the author has come to a definite conclusion that M. Victor Hugo is alike deficient "in the power of creating character true to nature and in unflinching elevation of thought." Now Mr. Matthews leads off by describing M. Hugo as "a born playwright," and has subsequently said that in his prose dramas "there is no falling-off in the ingenuity of invention or in the constructive skill of the author," although the plays "seem somehow on a much lower level than those in verse." It is difficult, and perhaps unnecessary, to reconcile the various positions which the writer thus takes; and perhaps what explanation there may be can be found in his concluding paragraphs, in which, having said that "the best part of him [M. Hugo] has got out of literature into life," the writer goes off at score into a burst of "high-falutin'" enthusiasm over M. Hugo's career as apart from his writings. We must confess to being no more impressed with the truth of this than of the statement that "no great dramatic poet, no one who was truly a dramatic poet, could have written such stuff" as (we are tempted to quote "je vous le donne en cent") "*Marie Tudor* or *Angelo*." From M. Victor Hugo Mr. Matthews passes to Alexandre Dumas père. Here we are far more at one with him than in what he has to say of M. Victor Hugo, and special praise may be given to the judgment and insight with which he has written on the vexed question of Dumas's *collaborateurs*. No one who has considered the question seriously is likely to disagree with Mr. Matthews's conclusion as to the true history of the *Tour de Nesle* that "looking back now, one can scarcely have a doubt as to whom the success of the drama was due—whether to M. Gaillardet, who had not done anything like it before, and who has not done anything like it since, or to Dumas, who had shown in *Henri III.* and *Antony* his ability to write a play of precisely the same quality. The original sequence of situations was no doubt suggested by M. Gaillardet; but the play, as it stands, is unequivocally the handiwork of Dumas." Of *Henri III.*, which may claim the honour of the first Romantic victory on the boards of the Français, Mr. Matthews gives a spirited sketch, although, by the way, he does not seem to be aware that the incident of the husband's clasp ing his wife's wrist with his iron gauntlet is taken from Scott. "I am inclined," he says, "to call *Henri III.* Dumas's best drama. It has a compressed energy, and a certain elevation of manner, not found together in any of his other plays." Here we are disposed to agree with the writer, although he has, perhaps, underrated some of the other plays, and notably *Don Juan de Marana*, which he calls, it must be admitted with some show of reason, a "hodge-podge." The expression cannot, strictly speaking, be quarrelled with; but we are inclined to think that the writer might have seen more merit than he has done in the play, in spite of its obvious, and in some respects shocking, faults. However this may be, we are in the main disposed to agree with Mr. Matthews's estimate of the elder Dumas, which is interesting in itself, and valuable as an antidote to the stupid stuff which used not very long ago to be talked and written about one of the great figures in modern European literature.

From Dumas Mr. Matthews passes on to Scribe, and here finds occasion for giving a brief and lively sketch of the growth of the *vaudeville*, and of its final transformation in the hands of Scribe:—

In 1820, four years after Scribe's first success, M. Poirson, his collaborator in that play, opened the Gymnase theatre, and at once bound Scribe by contract not to write for any rival house for the space of ten years. This is the decade of Scribe's most copious production. Aided by a host of collaborators, he brought out at the Gymnase a hundred and fifty pieces, nearly all of them *vaudevilles*. Sure of his public, Scribe gave the *vaudeville* still greater extension. From one act he enlarged it often to two, and at times to three acts. From a merely jocular and hasty representation of scenes from every-day life, he raised it now into comedy, and again into drama. As he trusted more and more to his plot, to the situations which his wondrous constructive skill enabled him to present to the best advantage, the couplets, although still retained, became of less and less importance; they could even be omitted without great loss. In at least one case this was done. Scribe had written a *vaudeville* in one act for the Gymnase, intending the chief part for Léontine Fay, who, however, fell sick before the piece was put into rehearsal. The author cut out the couplets, and cut up the play into three acts, changing but one line of his original prose in so doing. Then he took *Valère*, a comedy in three acts, to the Théâtre Français, where it was accepted at once, and where Mlle. Mars acted the blind heroine with her usual graceful perfection. This anecdote shows how the *vaudeville* had grown in Scribe's hands. A *vaudeville* which a skilful touch or two will turn into a comedy fit for the Comédie Française is very far from the *vaudeville* which is only a hastily dramatized anecdote. Of this *comédie-vaudeville*, then, Scribe was really the inventor, as well as its most industrious maker.

This is appreciative and true enough; nor is it untrue of Scribe that "his characters are silhouettes, into which the scissors have cut also the date." Mr. Matthews may indeed be congratulated on having done Scribe, to some extent, a justice which it was fitting should be done, and the adequate doing of which is necessarily the result of much pains. He contrasts fairly enough Scribe's method of treating his collaborators with that adopted by Dumas; but in so doing he is careful not to injure in any way the impression which he has given of Dumas. We have qualified the statement made above that the writer has done justice to Scribe, because here, as elsewhere in his volume, Mr. Matthews seems best as he draws to the end of his chapter with a desire to "hedge." Having told us many facts that we read with interest,

and having shown considerable appreciation concerning Scribe, he ends up by, to put it shortly, finding fault with him for not having written what he never attempted to write:—"He showed no knowledge that life is more than mere work and play, that there can be grand self-sacrifice, noble sorrow, or any large and liberal sweep of emotion." Setting aside the fact that these very qualities are the making of *Adrienne Lecouvreur* (a play which, as Mr. Matthews is forced to admit, owes at least as much to Scribe as to his collaborator), it is left for us to ask why Scribe's commentator, having given him the praise due to him as the inventor of a form of comedy which has since become stereotyped, should rail at him for not having done something quite different. This is a form of criticism which is but too common, and we cannot but regret that Mr. Matthews should have adopted it. It is remarkable, in connexion with what we have already hinted as to M. Zola's influence, that in the chapter on M. Augier, which follows that on Scribe, Mr. Matthews is unstinted in admiration for M. Augier, and at one point backs his opinion with a quotation from M. Zola. It is possible to have a great admiration for M. Augier without M. Zola's authority; and we share Mr. Matthews's admiration to a considerable extent, though we may not go so far as to class Giboyer with the oddly-assorted company of "Sancho Panza, Faletaff, Tartuffe, and Captain Costigan." Akin to this in spirit, though infinitely more startling in itself, is what the writer has to say later on in his chapter on MM. Meilhac and Halévy concerning *La Belle Hélène*. Of this *libretto* he writes that, "allowing for the variations made with comic intent, it is altogether Greek in spirit—so Greek, in fact, that I doubt whether any one who has not given his days and nights to the study of Homer and of the tragedians, and who has not thus taken in by the pores the subtle essence of Hellenic life and literature, can truly appreciate this French farce." This might lead one into pleasing visions of MM. Meilhac and Halévy's long devotion to studying "the subtle essence of Hellenic life and literature," and the joy they experienced when they felt that they were at length sufficiently imbued with Grecism to write "this French farce," and forthwith set to work to do so; but, in truth, suggestions like the one just quoted baffle all comment and can only be left to speak for themselves. There is, unluckily, a good deal more of the same kind in this chapter; but the specimen which we have quoted may be enough to show its purport. Here, as at the end of his otherwise well-considered chapter on M. Feuillet, Mr. Matthews seems to have been carried away by his desire to say, at whatever cost, something which nobody else would be likely to say. However, as we have before said, he has chosen a subject which is especially open to controversy, and therefore perhaps especially likely to provoke a tendency to paradox, and it is, at any rate, refreshing to find a writer who has so completely the courage of his opinions whatever they may be.

#### THE BRAES OF YARROW.\*

MR. GIBBON has written some pleasant novels, and he has succeeded best when he has taken Scotland for his field; but we are sorry that we cannot congratulate him on his latest venture. The historical romance is always a hazardous experiment, and must inevitably provoke disadvantageous comparisons. It is not every man who has the genius of a Walter Scott or a Victor Hugo, or who can throw himself into the life of distant times even with such moderate and ephemeral success as a G. P. R. James or a Harrison Ainsworth. And we must say for Mr. Gibbon that his deprecatory dedication suggests a modest consciousness of failure. It is addressed to "My Boys," which commends the book to our merciful consideration; but at the same time it throws out an indirect challenge to the critics:—"There are in it sundry historical anachronisms, but I am not going to point them out; first, because you ought to be able to discover them yourselves; and next, because there will be plenty of critics to direct your attention to them." We should fancy that the discovery of the anachronisms in question would be easy to any fairly well educated boy, and there can be no manner of doubt that they will not escape the most superficial reviewers. In fact, the whole of the novel, in style, incident, and suggestion, strikes us as a consecutive anachronism from the beginning to the end. The scenes of the story are laid in turbulent, distracted, and semi-barbarous Scotland, in the year succeeding the disastrous defeat of Flodden. The chief characters, under the rank of great historical personages, are adventurous soldiers of fortune, or wild Border barons who lived by foray or plunder. Yet, if the parochial school system of Scotland had been as well organized in the fifteenth century as at present, they could hardly have done more credit to their instructors. Lord Angus boasted, in Scott's *Marmion*, that, save Gawain the learned Bishop of Dunkeld, no son of his could pen a line. But probably the Douglas family would have kept a capable private tutor, had such appendages to a great establishment been common. In *The Braes of Yarrow* the ladies and gentlemen read and write with the greatest readiness. A nameless man, though he subsequently turns out to be a nobleman of high birth, who has been appointed, by a stroke of good luck, full private in her Majesty's Guards, sits down at a moment's notice and dashes you off a letter to the dictation of the head of the house of Angus.

Mailed warriors glance their eyes over correspondence as if they were merchants in the city of London opening their letters. Young ladies of rank lightly scribble *billets-doux*, and we have a pseudo-noble who imitates the statutory offence of Lord Marmion for which Scott was so severely ridiculed, and forges with such perfection of calligraphy that it is impossible to detect the imposture. Seeing that the good society of the time has mastered the difficult art of penmanship, it would be cavilling to take any exception to their style of conversation. Yet we cannot help being somewhat taken aback when rough Borderers and their retainers, in their wildest outbreaks of unbridled passion, attend to the rules of speech with severe propriety, and even rise into flights of polished eloquence. It is true that some mild oaths are thrown in by way of make-weights; but even oaths like "Odds boddikins" seem anachronistic, and savour strangely of modern times. Even the habits and mode of living of the aristocracy appear to have been more luxurious than is popularly supposed. Thus we are informed that "the new Lord of Binram occupied an *elegantly furnished suite of apartments* on the second flat of a house in the Canongate, near the Netherbow Port." The italics are our own; and we are only surprised that Mr. Gibbon does not condescend to describe the Lord of Binram's muffins and coffee, and his dressing-gown and slippers, and the copy of the *Edinburgh Courant* laid on the breakfast-table by the solemn valet in respectable black. There are Geneva clocks chiming from the chimney-pieces of Holyrood Palace, though we believe it was towards the end of the century that *horlogerie* began to flourish in Geneva; and we have some novel lights on the weapons of the period. Nor is it only in the costumes and properties of his thrilling melodrama that Mr. Gibbon ventures on audacious liberties. The scenes are laid partly in the Scottish capital, partly on the Borders; and horsemen ride from one to the other at a pace that might be envied by the occupants of modern Parliamentary trains on the Caledonian and North British Railways. So far as we can gather, one lady of the highest rank, who has been ravished and hurried away by the greatest villain of the piece, only musters breath and resolution to question him as to his purpose when they are drawing bridle on the Braes of Yarrow. We take no exception to Gilpin Horner, the original of Lord Cranstoun's Goblin Page, being transferred from the farmhouse of Todshaw Hill to the fortalice of the freebooter Scott of Tushielaw, since, being still a being of mystery, he is a fair subject for the fancy.

To return to Mr. Gibbon's dedication, where it deals with the matter of the novel. We are told "It is an old-fashioned story of hair-breadth escapes, of mysteries, of hard fighting." So it is, undoubtedly. In fact, the hairbreadth escapes are at least as inexplicable as the mysteries, and the hard fighting introduces us to warriors with the proverbial nine lives of the cat, or who, like Achilles, seem to have been bathed in the Styx and made absolutely invulnerable to pikes and broadswords. Most of the escapes naturally fall to the lot of Gilbert Elliot, who may be regarded as the novel's hero. He is tracked by moss-troopers, guided by savage bloodhounds. His chivalrous disposition and his excellent heart induce him to encumber himself with helpless females. But, with the good luck as well as the courage of the knight-errant of romance, he mows down his enemies "like the seeded hay," and gives them the slip in thickets and morasses with which they ought to have been as familiar as the rabbits or the wild ducks. But three of his adventures are specially remarkable, and they follow each other in an ascending scale of sensation and in the natural sequence of the story. On the first occasion he obtains admission in disguise to the tower of the wild freebooter, Scott of Tushielaw, with the purpose of rescuing a fair captive with whom Scott means to make a Sabine marriage. Elliot, although interrupted in the course of his proceedings, continues nevertheless to saw through the iron gratings of the window, and lowers himself from an upper chamber by means of a stout rope, with the buxom form of a Scottish matron buckled to his stalwart back. The adroitness of the achievement would have done credit to a London fireman, even had there been no urgent reason to hurry over it, nor any apprehension of a hot pursuit. It might have been supposed that Elliot would be slow to trust himself near such a rat-trap a second time; but the behests of chivalry and generosity create combinations of circumstances over which he has no control. A second time he is in one of the dungeons of the tower of Tushielaw, and on this occasion an involuntary tenant. Either by design or accident he touches the spring of a trapdoor in the flooring, and tumbles into a subterranean watercourse that communicates with the Yarrow. Considering that it is "mirk night," and that Yarrow is in "speat," we should have concluded we had seen the last of him had he been anybody but the hero of the book. As it is, we are less surprised than we might otherwise have been when, as another acquaintance of ours is stamming a flooded ford a long way down the valley of the Yarrow, a body is washed up against his struggling steed, to be dragged to the bank and happily resuscitated. Surely a special interposition of Providence, if ever there was one! And yet Providence has a crowning deliverance in store for this special favourite. Master Elliot has unduly prolonged his leave from his corps, owing to the untoward circumstances to which we have referred. Without the formal process of a court-martial, he is summarily condemned to death for desertion. We do not see why a court-martial should have been dispensed with, seeing that a firing party of twelve of his comrades is told off—in the sixteenth century—to do execution on the culprit.

\* *The Braes of Yarrow: a Romance.* By Charles Gibbon, Author of "Robin Gray," &c. London: Sampson Low & Co. 1881.

When the solemn preliminary arrangements have been completed, we are all impatient for the arrival of the inevitable reprieve. The gallant victim makes it his dying prayer that he shall fall facing the firearms with eyes unbanded. The pieces are levelled, and for the life of us we cannot understand what delays the lingering messenger of good tidings. The pieces actually go off; the object of their concentrated aim tumbles over; and, veteran novel-reader as we are, we are utterly taken aback. This premature catastrophe in the gloomiest style, à la *Bride of Lammermoor*, has upset all our prognostications. Yet, had our faith been a little stronger, as it should have been after our experience of Mr. Gibbon, we might have known the death was only a false alarm. After twelve men have fired at him from a distance of a very few paces, and under the immediate eyes of their officers, who must have noted the elevation of their pieces, Elliot is picked up very little the worse. One shot has penetrated his shoulder, the eleven remaining charges have gone wide of the mark. That he establishes his claim to a peerage and a property, that he marries the lovely daughter of the all-powerful Earl of Angua, is absolutely something of an anticlimax after all that has befallen him.

The lives of the two villains of the story are, perhaps, almost as remarkable; though the powers of evil who befriend them naturally throw them over at the last. The wrongful possessor of the lands and title to which Gilbert Elliot proves the rightful heir seems likewise to carry a talisman on his person which makes him proof to steel and rope, to fire and water—at all events till his inevitable term is up. Besides, his crafty head helps his ready hand, for he is gifted with the diabolical astuteness of an Achitophel. But his staunch comrade and ally, Scott of Tushielaw, the historical freebooter to whom we have already referred, is even more mysterious in his ways and habits. We should, for example, hardly have expected to find money so plentiful with a man of his stamp that he could afford recklessly to offer a reward of a hundred gold pieces for the recovery of a captive who had escaped from his hold. We should have fancied that the "Border lads of the belt and bridle" would have been ready enough to obey the truculent chief's behests without any such fabulously extravagant stimulus. But we are still more puzzled by the deed of treachery imputed to Tushielaw on the eve of the battle of Mudden. It is not like a bold Scottish riever of birth and name, although with decidedly loose ideas as to property, to sell his king and country to the Southern with whom he was at deadly feud. We should have thought his information as to the ways and means of circumventing the Scottish host must have been absolutely worthless, considering that Lord Surrey was on English soil and must have had many "Northumbrian pricklers" in his camp who knew each pass and peat-moss in the county. And the reward for which the traitor stipulated is still more extraordinary, being a free pardon for crimes committed in the English marches, with protection against the vengeance of the Scots he had betrayed. It was only by a generous afterthought of the English general that Tushielaw consented to accept a sum of money in addition. With which crowning extravagance we may close our notice of a novel abounding more copiously in anachronisms and absurdities than even its ingenious author hints in his dedication.

#### CALENDAR OF STATE PAPERS.—DOMESTIC SERIES, 1654.\*

THOUGH there are many more years than two in the history of England in the seventeenth century which might claim for themselves the title of the Year of Wonders, bestowed upon 1666 in verse and upon 1602 in prose, the year 1654 can hardly with any propriety be reckoned among them. In foreign affairs, it is indeed notable for the termination of the most serious foreign war waged by this country under the Commonwealth; but though the peace with the United Provinces was very popular, and brought with it very substantial advantages, it went but a small way towards the realization of the ideas with which the English Government had first entered into the negotiations. Altogether, though in this year there was a great deal of diplomatic activity at Whitehall, and though by treaties and otherwise the spirited Protestant policy of the Protector was preparing for the great strokes of 1655, no more serious complication with a foreign Power arose than the little difficulty about the Portuguese ambassador's brother and his execution on Tower Hill. Foreign ambassadors unencumbered by felonious or riotous relatives were beginning to feel comfortable again in a capital which once more offered the decent luxuries of a Court; two members of the Council were, in a sort of rotation, appointed to dine with the Dutch and the French Ambassadors; and, while the former were allowed to receive duty-free four hogsheds of white French wine and a quantity of stockfish, the latter, M. de Bordeaux, was liberally "allowed a diet of fifty dishes for first and second course, and thirty dishes of fruit and sweetmeats each meal, and also a convenient allowance for the table of his attendants."

At home too, though the country at large could not yet be said to have made up its mind to "rest and be thankful" under the recently organized system of the Protectorate, yet, inasmuch as Parliament was not to assemble till September, and the ordinances of the Protector and his Council were in the meantime

to have the force of law, there was every reason for prudence on the one side and for acquiescence on the other. With an all-important election so near at hand, it could not but be the primary object of the Government, while causing itself to be respected on all sides, to give as little offence as possible to any interest; and the season was on the whole propitious enough for the various interests to exert themselves with considerable activity on their own behalf. It was a year, if ever year there was, of petitions for the redress of personal grievances, the discussion of which must have occupied no small part of the time of the Council, even when they were remitted for report to one or another of its Committees. There were claims, to which both precedent and policy forbade a deaf ear being turned, for losses in property sustained during or in consequence of the civil war; and there were the petitions of the poor disestablished servants of the Royal household, which in common humanity could not be rejected unheard. Parishes were crying out for ministers, and from the Universities, or rather from that University of Cambridge which the Puritans flattered themselves on having transformed into just what it should be, came chronic entreaties of needy Masters of colleges for payment of the "augmentations" granted them. One Master only, Dr. Seaham of Peterhouse, had got more than his due, having taken too large a share of Dean Cosin's sequestered estate; while his (long since purified) college was detaining, and not, it was alleged, taking very good care of, the Dean's library. The petition of his daughters for payment of their lawful allowance out of the estate now enjoyed by Dr. Seaham and another, and for the restoration to them of the library, was granted; and thus the books came to form "the nucleus of the collection which exists in Bishop Cosin's library at Durham." The desires of the trading classes naturally took a direction in accordance with the commercial policy which gloried in the Navigation Act. The London wine merchants openly demanded protection for their trade, and with some reason asked that, if the retail prices of wine were fixed, the wholesale prices should be fixed likewise. The "ancient hackney coachmen of London," appealing to their many unpaid services to the Parliamentary armies, complained of being "mightily oppressed by a number of hackney coaches set up by coach-makers, harness-makers, innkeepers, ostlers, tapsters, nay, many gentlemen and ladies." And, under date of May 4th, the Council was called upon to deal with a petition to the Protector which purported to come from "the masters and wardens of the handicraft companies of London, viz., merchant tailors, weavers, cobblers, hatband-makers, cutlers, and card-makers," and which throws no very pleasant light upon the sentiments of the class to which the petitioners belonged. It is conceived quite in the spirit in which the London apprentices in the Plantagenet days resented the prosperity of the Easterlings, and in which under Henry VIII. the London weavers proposed to put an end by a kind of industrial St. Bartholomew to the activity of the Venetian merchants; but its most astonishing feature is the coolness with which it treats any supposed claim of the foreign interlopers upon the religious sympathy of English Protestants. The gist of the appeal lies in the complaint "that the French and Holland strangers in and about London have petitioned Parliament, not only for the free exercise of their religion, but for the free use of their trade"; and it is addressed to the Protector in person, because he had spoken to the late Council of the justice of the petitioners' cause, while that Council and the late Parliament had shown themselves very ready to answer the desire of the aliens, all proceedings against whom had been stayed by an Order. In the two annexes to this document the whole case is argued with so candid and complete an exposition of the fair-trade principles of the period that we cannot resist quoting Mrs. Green's abstracts in full:—

I. Statement by the native manufacturers and tradesmen of reasons why aliens should not trade in or near London, and of the mischiefs which would follow.

That the number of native artisans is more than enough, and their skill equal to that of strangers.

That natives are compelled to serve apprenticeships, are incorporated, and punished for bad or deceitful work, and have to pay towards their companies, and also to pay assessments, so that strangers who have not these burdens can undersell them, invite over their own countrymen, and ingross trade. They take large houses, divide them, take inmates, and so breed infection.

They are maintained by getting what we should else have for our maintenance, so that we can hardly live. Divers Parliaments have been so sensible of this that they have made sundry statutes against strangers, from Edward IV. to Henry VIII.

The handicraft men are the nursery of soldiers, and all the army being such, if it were disbanded, they would want employment, strangers having engrossed it, because, being generally disaffected, they stayed at home whilst the English engaged for Parliament, so that the latter have now to turn to dishonourable employments, as porters, chimney sweepers, &c.

If their being protestants, fled hither because of persecution, be an argument that they should trade, it is a better argument for the natives. The law allowed them to work as servants to English masters, but they should not be masters, for it is not prudent to gratify them and discontent us. All other nations prefer their natives to strangers, and an Englishman is only allowed to work as a servant in France or Germany.

II. Statement by 35 Englishmen, in contradiction to a report that English artisans and professors of sciences residing beyond seas are allowed to practise their trades as the natives, that they and other English in Paris and elsewhere have had their tools taken and destroyed, been reviled, beaten, and imprisoned for working as masters, and that they are only tolerated as servants and journeymen. They beg that strangers may not by such toleration eat the bread out of their mouths. Signed by 7 painters, 3 goldsmiths, 3 joiners, 5 cutlers, 12 tailors, 1 combmaker, and 4 weavers.

\* *Calendar of State Papers.—Domestic Series, 1654.* Edited by Mary Anne Everett Green. Published under the Direction of the Master of the Rolls. 1880.

We have noticed no further reference in the present Calendar to this remarkable remonstrance; nor does it appear whether the Protector further interested himself in clients so naïvely regardless of the "league and union" which (to quote Mr. Commissioner Lisle) "this nation had with the Protestant interest abroad." The sittings of the Council, largely occupied as it was with details such as those enumerated above, were in fact but very rarely honoured by the presence of the Protector himself, who seems to have lacked that omnivorous appetite for business, small as well as great, which is not inseparable from the energy of a far-seeing and resolute statesman. He was not, however, absent on the extraordinary occasion of April 12th, when he passed, together with other ordinances connected with the same subject, that "for uniting England and Scotland into one commonwealth." None of Oliver Cromwell's measures redounds more largely to the credit of his statesmanship than this; but there is a flavour of hypocrisy, unfortunately not altogether singular in the history of legislative Unions, in the preamble of the sagacious Ordinance in question, which recalls the circumstance that "in December 1651 Parliament sent commissioners to the people of Scotland to invite this union, who, by elected deputies, consented to it." The elected deputies sent up for the purpose to Edinburgh had certainly signified their assent to the measure proposed to them by Vane, St. John, and their colleagues; but its unpopularity with the Scottish nation at large was a very open secret, and could hardly surprise Cromwell, whose army, during its march to Perth in this year 1651, according to Whitlocke, "saw not one Scotsman under sixty years of age, nor any Scots youth above six," there being a general belief that the English intended to cut the throats of all male persons between those ages. The number of representatives in Parliament (then, of course, without a House of Lords) allowed in Cromwell's Ordinance was thirty only—or fifteen less than the number of representatives in the House of Commons granted by the Act of 1707; and the grouping of shires, as afterwards arranged by Lambert and reported to the Council on June 2nd, is not without interest. The Ordinance is, it need hardly be said, silent on the important point of religion; but it may be worth noting that the Protector was, or seemed about this time to be, particularly anxious to conciliate the good will of the Presbyterians; "it is said," writes Secretary Nicholas from Aix-la-Chapelle, "he now seems resolved to run absolutely their way, with which the Independents and Anabaptists (the greatest part of his army) will be much unsatisfied." "What do you hear there?" inquires the "good old secretary," as Glarendon calls him, "of his permitting so many Presbyterians to be of his Parliament?" Sir Edward Nicholas proved a true prophet in his prediction that Cromwell would "purge the new elections," though he was not sanguine enough to foresee that even the purged Parliament would resist the Protector's wishes. Meanwhile the Government had taken the greatest pains with the elections. The forms of indenture supplied by the Council to the sheriffs and electors of county members for the choice of "fit and discreet knights" contained a proviso (inserted also in the indentures for borough elections) that the persons chosen "do not alter the government as now settled in a single person and Parliament." Further precautions were taken; but the Committee for elections had many failures to report when the critical time at last arrived. More especially in the West of England and in Wales, disaffected persons, and even actual delinquents, were returned; and from Bristol, the second city in the realm, "divers free burghesses" sent up their plaint to the Protector, how they had come to the place of voting "supposing that the business would be so carried on as to secure the liberties which had cost seas of blood and unspeakable sufferings; but the sheriffs encouraged those who had favoured the late King to vote, promising to bear them out in so doing, and affronted and threatened us, refusing to allow some of us to vote, though duly qualified. They declared that what they did contrary to the instrument" of 1653, which the Council had ordered to be publicly read at the proclamation of all writs of election, "was the judgment of counsel, which we cannot believe, whereon the Cavalier party carried things as if there were no Commonwealth or Protector, but as if Charles Stuart were again enthroned in the sovereignty of this nation, so that we protested against the election, and left the hall." If things do not appear to have gone quite as badly in the Royalist counties of Cumberland, Cheshire, and Lancashire, it was not for want of spirit in the landlords; but perhaps they were apprehensive of the Committees which the Council were about this time sending to mediate between them and the well-affected tenants who had complained of oppression by their "tyrants."

As is well known, the earlier part of the year had not passed by without its Royalist plot, the frustration of which was not more fortunate for its intended victim, the Protector, than for the reputation of King Charles II. and Prince Rupert, whose sanction had been obtained for the scheme. Mrs. Green prints the account of the trial of the principal conspirators—Colonel Gerard (the Gerard whom Don Pantaleon Sa had attempted to kill, but whose fate he was destined to share on the selfsame day), Peter Vowell, and Somerset Fox. Though all three were condemned to death, the life of the last-named was spared; and Cromwell's moderation in bringing to trial only three out of two-score prisoners has been justly praised. Mrs. Green not unnaturally dwells on the strangeness of the argument, as coming from the lips of the President of a Commonwealth High Court of Justice, that "to compass the death of the supreme magistrate of this nation, whether called by the name of King, Queen, or what name soever, is treason

by the common law of England." But, though the Protector's Government tempered justice with mercy, such occurrences as these rendered the strictest vigilance indispensable to its existence. Gerard and Vowell's conspiracy was discovered in May, and on the 24th of that month, the Protector being present at the sitting, the Council issued a proclamation requiring all householders of London, Westminster, and Southwark, on peril of being themselves considered partakers in the bloody designs recently come to light, to furnish a complete list and account of their lodgers. On June 9th the Council ordered a classification by commissioners of the persons apprehended—"Irishmen" forming one category, and "persons called hectors, common gamesters," &c., another. A number of persons were in this year, both before and after the discovery, sent to the Tower, where, as the list produced at the Council on July 31 shows, still lay several noblemen committed thither in 1651 for bearing arms against the Commonwealth.

As might be expected, what Mrs. Green calls the "literary entries" in this volume are few and far between. The execrable verses of "Chas. Stayning," communicated to the Council by some informer in proof of their author's disaffection, are not interesting in themselves; but the testimony of the informer to the influence exercised upon this Malignant by "the late King's book," which he "always carries about with him, and reads to many," is worth noting. The only man of letters who figures by name in this volume is—with the exception of the irrepressible Samuel Hartlib—Sir William D'Avenant, who, after being conditionally released from his imprisonment in the Tower, had been arrested again for debt, and now prayed "for a general pardon, that he might live a faithful subject." Doubtless the prayer was soon granted, and he was thus two years afterwards enabled to commence operations for the "revival of the drama." Of "scientific entries," as we suppose they should be called by analogy, Mrs. Green notes the petition, for arrears of military pay and for compensations due to himself and to his brother slain in Scotland, of Captain Thomas Sydenham, afterwards famous as a physician. More dubious is the fame of the wondrous cures effected by Matthew Ooker, here upheld in a letter from an enthusiastic believer, who writes that "two things are now questioned—one, whether there be gifts of healing in the Church, as in the Apostles' times; the other, whether Mr. Ooker has those gifts, or only pretends to them." Some other details of more or less interest are pointed out by Mrs. Green in her preface; but we have already exhausted our space. The editor of this volume is one whose work requires no praise from us; it is always unostentatious, and always thorough.

It may perhaps be added that the sequel to the history of the quarrel between George Glapthorne and his constituency of the Isle of Ely (where he was at the same time Justice of the Peace and Chief Bailiff), to which Mrs. Green directs attention in her preface, will be found in a curious narrative contained in a pamphlet in the King's Library, and reprinted in the memoir of Henry Glapthorne prefixed to a recent edition of that dramatist's works. The upshot of this narrative is that George Glapthorne (of whose connexion with Henry we fail, by the way, to see that there is any evidence whatever), having complained of the aspersions cast upon him, was confronted with his accusers by the Council; and that, after evidence against him had been given, and his defence had at his request been postponed to the next day, he preferred not to put in an appearance, but to allow judgment to go by default. The mention of a dramatist reminds us that the marginal note found by Mrs. Green on a copy in the Order-book of the Council of a letter to the Hon. Captain Charles Howard, bidding him provide for the spread in the north of a proclamation prohibiting horse-races and other meetings of disaffected persons, still awaits elucidation. It runs thus (the query is the editor's):

Old Noll's rules to put down interludes (?) of the 99, then to govern the rooth J.C.

Surely we are not wrong in suspecting the heading "Petition of Armiger Warner to the Protector," in p. 219, to be a mere accident, though there is a corresponding entry of "Warner, Armiger," in the index. Nor do we quite understand the designation of Sir Edward Nicholas as "Sir Edward Cologne Nicholas," in p. 407. To attempt to rectify an entry concerning any one of the Counts of the Wettarabian College, otherwise and still more strangely Anglicized as the Counts of Wettarabia (p. 111), might seem sheer presumption; but we cannot suppress a suspicion that the "Count of Hainault" who contributed so munificently to the English subsidy was the Count of Hanau.

#### BUDDHISM AND EARLY BUDDHISM.\*

MR. LILLIE furnishes a peculiarly unhappy illustration of the proverbial danger of a little knowledge. He has devoted considerable reading and an evidently zealous interest to one of the most important and fascinating subjects not merely of to-day but of the future; for there can be little doubt that Buddhism is destined to exercise an increasing influence over the learned and even the popular mind as its history and real character become more generally and accurately known. But he has touched upon this great subject with an unskilful hand. It needs a scholar to treat of Buddhism in these days, when research has revealed so much that

\* *Buddhism and Early Buddhism*. By Arthur Lillie (late regiment of Lucknow). With numerous illustrations. London: Trübner & Co. 1881.

is subversive of old views; but Mr. Lillie gives no evidence of such qualifications as are essential to the proper execution of his work. He has not learnt the rudiments of scientific method, and constantly confuses resemblance with relationship, in the manner of all beginners. His reading, though wide, is in many respects obsolete; he has not kept pace with the literature of his subject, and consequently it is common to find him seriously advancing propositions which have been shown to be erroneous. But his chief disability is the possession of a suicidal gift of imagination which he lets loose upon every department of learning with a recklessness that is almost as amusing as it is astounding.

The very title of the book is a misnomer. Early Buddhism, of which it professes to treat, is precisely the one subject which is not to be found in Mr. Lillie's work. There is a great deal of interesting discussion of Gnosticism, the Essenes, Ferdinand Baur, and higher Christianity, with a thousand irrelevant or doubtfully relevant matters; but Early Buddhism is not among them. The truth is that Mr. Lillie does not know what Early Buddhism is. He seems to have adopted the conclusion that the Northern Buddhist accounts contain the oldest form of the religion, and accordingly proceeds to illustrate this supposed primitive Buddhism by examples taken from the most corrupt modern developments of it. He collects practices and precepts from China, Burmah, or anywhere except the right place. He scouts the Singhalese books and substitutes Father Borri, whose account of Cochin-China pursues the reader relentlessly throughout the book. It is needless to say that modern usage affords no evidence for the true form of Buddha's own teaching, and that Mr. Lillie's premises are therefore placed entirely out of court. His argument from the titles on the Asoka monuments cannot be seriously urged when we know that they are rather descriptions of contents than fixed titles, and may easily be varied. How far such a method may lead a writer astray may be gathered from the curious statement in p. 47:—

I have dwelt somewhat at length on this supernaturalism, because it is of the highest importance to our theme. Buddhism was plainly an elaborate apparatus to nullify the action of evil spirits by the aid of good spirits operating at their highest potentiality through the instrumentality of the corpse or a portion of the corpse of the chief aiding spirit. The Buddhist temple, the Buddhist rites, the Buddhist liturgy, all seem based on this one idea, that a whole or portions of a dead body was necessary.

The assumption that the Buddhism of to-day in China or Burmah is the best evidence for the character of original Buddhism is not the only false principle adopted by Mr. Lillie. He is apparently careless of the ordinary progress of history, and seems to think that a man may suddenly arise and create a new religion and social system, and impose them on a great people entirely of his own will, and without the aid of any external circumstances. All history points to a different explanation of a great man's influence, and the modern student looks first at the surroundings and antecedents of a reform or revolution before he attributes it solely to the mind of one man. Even Napoleon, who was of all men the nearest in appearance to the individual motive power which holds its energy entirely of itself, and exerts it without the help of anything outside, has lately been explained as the creation of the *Jeune en masse*. Mr. Lillie, however, will allow nothing of this with Buddha; and the want of that study of preparatory and conducive circumstances which the French call *mésologie* is fatal to the attempt to trace the beginning of Buddhism. It might have been expected that the chapter entitled "The Historical Buddha" would contain something of this; but it is, on the whole, the least historical part of the book, unless, indeed, we accept the term on the principle of the old axiom that all history is falsehood.

But it is Mr. Lillie's imaginative bent that plays him the scurviest tricks of all. There is nothing he does not illumine with the flare of fancy. Everything has a mystical meaning for him, and if it is not very obvious at first, a wide induction from miscellaneous facts, not at first sight connected with the matter in hand, is sure to establish it to the author's satisfaction. Mr. Lillie's chief idiosyncrasy reminds us of a powerful story by Dr. Wendell Holmes. Mr. Lillie sees nothing but serpents wherever he looks. In the Buddhist zodiac he finds a serpent in every crooked line. "For Aries I have given a horse with two serpents on his head—the solar-horse and his father and mother." Without discussing the place of the serpent in mythology, it may be as well to say plainly that the horse with the two serpents on his head is just a ram and nothing more. The same may be said of the lion's tail. The Swastika, again, is here derived from the crossed serpents which stand for Pisces in the Buddhist zodiac as drawn by Mr. Lillie, but the derivation is entirely wrong. The serpentine shape, again, is not the most ancient form of the Tri Ratna, and Mr. Lillie's theory of its origin is merely another example of his ophiomania. All these serpentine illustrations are much more modern than the symbols they are supposed to have originated; and this part of Mr. Lillie's labours must be considered as misdirected energy.

The luxuriant growth of fancy is painfully exhibited in the chapter entitled "Buddhism in the Catacombs." Jonah and the whale may or may not be solar symbols; but it is surely ridiculous to trace so ancient and widespread a story to a Buddhist source and thus explain its appearance in the Catacombs. It is possible to be too credulous, even in the identification of solar myths, nor is it wise to advance with an air of conviction theories which have been keenly disputed, and which at the best can only be proposed as possibilities. There is a vast deal too much of this assurance in the chapter on "Buddha and Woden." The connexion between

Scandinavia and India is well known, but there is considerable uncertainty about many details which apparently give Mr. Lillie no uneasiness. "Why should two nations," he asks, "so remote as China and Norway, in their war-junks, their arms, their clothing, have so much in common?"—

I have found an answer that seems to me convincing. In the first century of our era Kuei-Chuang, a Chinese prince, subdued Cabul, Kandahar, and Kopen, and converted it to Buddhism. This, according to Professor Holmboe, was the special region of the Asas. At any rate this conquest quite accounts for the fact that the Chinese standard should by and by flaunt upon the galleys of the Vikings.—Pp. 236-7.

This "convincing answer" may serve as an example of Mr. Lillie's manner of accepting theories which, to say the least of them, are open to controversy. The conversion of Kabul, &c. by Kuei-Chuang, in the first place, to Buddhism is improbable in the face of the unquestioned fact that Kabul was a focus of Buddhism at least a century before Christ, and was not likely to need conversion "in the first century of our era." Secondly, it is a matter of dispute whether this was "the special region" of the Asas. And, lastly, if it was, it is probable that they had left it before Kuei-Chuang arrived there. It is quite possible that the Scandinavians did in reality get their Buddhistic similarities from Afghanistan; but Mr. Lillie's method of proving it is not by any means so "convincing" as he believes. Another example is found in the slight and inconclusive chapter on Buddhism in America. Here again everything is assumed; whereas the identification of Fou Sang with California has been strenuously controverted, the supposed delineations of elephants are not clear beyond possibility of dispute, and the Mexican Buddha drawn on Plate IV. is open to the objection that the face is in profile, the head-dress (where again an imaginary serpent is introduced) is not Indian, and that other people besides Buddha sit cross-legged and wear necklaces.

The chapter on "The Historical Buddha" explains a good many peculiar fancies which meet one throughout the book. The following paragraph shows that in this chapter and no less clearly elsewhere—Mr. Lillie started with a preconceived theory to which facts were forced to bend:—

Our inquiry at starting was this:—Is there any evidence from which we may fairly infer that early Buddhism was propagated in India by a system of Freemasonry? From the nature of the Indian initiation, from the Triad Society of China, from the Buddhist (as opposed to the priestly) nature of most Masonic rites—the bloodless sacrifice, the poverty, the chastity, the refused crown, &c.—I think the answer must be given in the affirmative.—P. 138.

By a similar process of reasoning it might be argued from the practice of the monks of the Grande Chartreuse that the making of liqueur was among the primitive rites of Christianity. This Masonic theory, and the literature which Mr. Lillie has studied in order to elaborate it, have done much to injure his book by introducing a multitude of fantastic and unprofitable speculations. A footnote in p. 138 indicates the sort of works to which Mr. Lillie refers for his explanation of the spread of Buddhism—from King's *Gnostics*, through a series of Masonic manuals, to Philo on the Essenes and Therapeuts.

It is a pity that a good subject should be treated in this fashion; and the more so inasmuch as Mr. Lillie has spent some pains on his work, and has filled it with a large amount of interesting information on the comparative relations of Buddhism. There are many pages to which no exception can be taken; but, again, these are followed by some preposterous theory which can only mislead the reader if he is ignorant, or enrage him if he is learned. A work of this kind needs to be undertaken in a spirit of sober study, and not with a foregone conclusion. Above all, it is necessary to make sure of your authorities, and not begin at the wrong end. Mr. Lillie has done both; he has taken the less authentic sources for Buddha and early Buddhism to be the best authorities; and he has argued back from a corrupt and perverted religion in order to trace the original and pure form. In the absence of other means this method must be adopted; but in the present case it is not only unnecessary, but injurious to the great subject it pretends to illustrate, and fatal to the usefulness of the book. In Mr. Lillie's own words:—"It is evident that, until the earliest Buddhism can be detached from the later Buddhism, the living from the dead, such inquiry will be premature." His book is a persistent attempt to effect precisely the contrary of this—to join the dead and the living together.

DERVAL HAMPTON.\*

IT is fortunate for Mr. Grant's readers that his new novel is but in two volumes. He begins his story not amiss, and goes on with a fair amount of success till he is half-way through his task. Extravagant though many of the incidents had been, and faulty as his style frequently is, yet he had interested us in the fortunes of his hero, and made us not unwilling to take up the second volume. But here we found a change greatly for the worse. There was a vast increase in acts of villainy of which we had had quite enough already; while the improbabilities of the tale, which had already drawn to the full upon our stock of credulity, became so great as to excite a feeling of contempt. It is not easy to understand why the author has thus overcharged the latter part of his book with characters and incidents that are so extravagant as to become

\* Derval Hampton: a Story of the Sea. By James Grant, Author of "Romance of War," &c., 2 vols. London: Allen & Co. 1881.

utterly ridiculous. Apparently it was not through that want of matter which often leads novelists to fill up with villains a great gap in their third volume, just as the ancient geographers filled up the blank spaces in their maps "with elephants for want of towns." Mr. Grant, it would seem, had much ado to get all his story into the space that he had at his command. "In detailing plot and counterplot," he writes, "cunning and selfishness, doubt, despair, and no small agony of spirit, we have much to compress in the latter pages of this our history." We could have wished that, instead of packing his villains so tight together, he had been content with a smaller assortment of them, and so had allowed both himself and them a little more elbow-room.

The story opens in a cottage in a Devonshire village. At first sight it seems scarcely needful to record that before the cottage lay a garden, and that in the garden were growing strawberries, asparagus, cucumbers, and peas. It is presently seen, however, that the peacefulness suggested by this enumeration of vegetable productions serves to form a strong contrast to the stormy and dark incidents that are to follow. The owner of the cottage is Mr. Groville Hampton, the hero's father. This gentleman was a moody and discontented man "on whom the world and society had smiled in other days," but had left off smiling now that he had run through his fortune. He had a further cause for discontent. "A destiny," he said, "over which I have no control, deprives me of my birthright; and I, who ought now to be twelfth Lord Oakhampton and tenth Lord of Wistmanswood, am a poor and needy man." In the second volume we find that destiny gets under the control of his old family lawyer, "a denizen of Gray's Inn." Novelists have laws and lawyers of their own, which have served them, and will yet serve them, many a good turn. The family that was in actual possession of the estates and title had not held them for much more than a century and a half. They had come into them by a mistake that was made in the year 1707, when the ancestor of that day, in ignorance that his eldest brother was alive and settled in Bermuda, "was called to the Upper House as the direct heir of Derval, Lord Oakhampton, who was forfeited (*sic*) under Edward IV., but was restored by Henry VII." No steps were taken by any descendants of the eldest brother till Groville Hampton's time. Instructed by him, "his stout and deliberate old lawyer," the denizen of Gray's Inn, called on Lord Oakhampton, and greatly alarmed him by the news that "with his title would go lands and estate, plate, pictures—everything even to your household effects." His Lordship not unnaturally points out that whatever proofs his opponents have "must be submitted to the legal acumen and most searching analysis of my law advisers." The deliberate old lawyer most handsomely admits this. "Indubitably, my Lord," he answered, "yet the dates are, fortunately for us, not remote ones." In the end a compromise, as will be seen, is fortunately hit upon, though not till the happiness of the hero and heroine had come within a few hours of being wrecked for ever. They would have been spared a vast deal of suffering had "the legal acumen and most searching analysis of the law advisers" ever discovered the Statute of Limitations.

We are, however, anticipating matters, and must return to the cottage in Devonshire, when the hero was but a child of six, "with a wealth of golden curls that rose crisp and in upward spouts from his forehead." *Gold and golden*, by the way, are somewhat too common in this story, above all in the opening scenes. We cannot properly object to "golden sands," "golden morning of life," "golden butter," "golden laburnham" (the spelling is somewhat odd), "golden dreams," "glare of the golden sunshine," "golden haze," and "billows of golden grain." We may, however, hesitate a moment over a sky that was "violet braced with gold," with waves below "that rose with a silvery sheen." And we must loudly protest when from golden curls we pass to "golden-coloured eyes," to "golden hazel eyes" and "false eyes of golden hazel." But to return to our hero. The moodiness of his father was more than made up to him by the tenderness of his mother. She is pleasantly enough drawn, but unhappily the necessity of the plot requires that she shall be carried off very early in the story. Her place is taken by a wealthy, but most wicked, stepmother. She it is who owns eyes "of that golden-hazel colour which so often goes with a duplicity of character." They were indeed of a very strange kind, for once, when she spoke of her husband's first wife, there came into them "a flash of subtle colour." Let the reader pause, and call upon his imagination to set before him a picture of a flash of subtle colour coming into a pair of false eyes of golden hazel. She treats the child in a way that was not unworthy of "the tiger-like expression" that came into her face. Still more cruel does she become when she gives birth to a son, who has "his mother's chestnut hair and her cunning yellow-hazel eyes." Her hatred is partly due to her knowledge of the claim her husband has to a peerage. Should he succeed, it would not be her son who would inherit the title. She does her best, therefore, to get rid of little Derval; and, as the most likely way of bringing him to an end, sends him to sea. Application is made to a firm of ship-owners to take him as an apprentice, and "the correspondence with them ended in Derval finding himself elected (*sic*) to seek his bread upon the waters as midddy." We are at once plunged into all those stirring incidents of a sea novel which used so much to delight our boyhood. Of course there is a good captain who is every inch a sailor, a tyrannical mate who never loses a chance of persecuting the lad, and a virtuous boatswain who comforts him and soon makes of him a thorough seaman. This worthy's language, for the most part, is

nautical enough, and none the less pleasing to us that, like the young hero, we often only understand about half of what he says. We regret, however, to have to notice that on one occasion he so far forgot himself as to talk of "the impetus of the wind." We like him far better when he warns Derval "not to run foul of the third mate's havae," who, he told him, "was often crank, and who yaws a bit in way of doing duty." It is all very proper for authors to use fine-sounding words; to call cutlasses and pistols "lethal weapons," and to write of a midddy's "uninitiated mind"; but we cannot allow them to fill our ears' mouths with language even bigger than their quids. We are glad to find that Mr. Grant does not make any of his characters use the scraps of French which he himself now and then introduces, and very needlessly too. Sea-sickness, for instance, he speaks of as *mal-du-mer*. Had he called it *mal de mer* his French would have been correct, though still very absurdly and even ostentatiously introduced.

Matters go on very prosperously with our hero, and his voyages are not without agreeable incidents. The wicked mate gets eaten by a shark, the ship is pursued by a pirate, a couple of abandoned vessels are fallen in with; tremendous storms sweep the decks and "gorge the lee scuppers," red flashes of lightning are seen, and also flashes of green lightning. On one occasion the black outline of the waves was so remarkable that it was not only serrated, but serrated like the teeth of a saw. Mr. Grant would seem to be familiar with Juvenal. Can he have forgotten the meaning of "serrated"? At the same time we should like to ask him whether he is correct in the title that he gives to a book from which he quotes—*Atlas Geographicus* (*sic*).

But these inquiries into words must not lead us away from our hero's adventures. Being a sailor, of course he saves the heroine's life on the sea-shore. This time she is not cut off between two headlands by the tide, but has a fall from a cliff. Her sash catches in a stump, and leaves her dangling in mid-air some fifty feet above a pool in the rocks, in which the hero had just before seen the dorsal fin of a great shark. Being a British sailor, he soon climbed up to her, and, grasping one part of her dress in his teeth and another in his left hand, brought her down in safety. She had violet eyes, and was, as might be expected, the only daughter of Lord Oakhampton. She was still but a child, and so the hero, instead of at once marrying her, returns to his sea life. His wicked stepmother, more enraged than ever at the reputation he had gained, plots his death. A far more terrible villain than any that had as yet been introduced appears on the scene as first mate. He is in her pay, and is pledged to kill the hero. At length he finds, as he thinks, his chance, and, striking him on the head, leaves him senseless on an island that swarmed with savages. The ship sails off, and for the hero there seems no chance of escape. Of course he does get off, or he would have been no hero. Meanwhile his wicked half-brother of "the cunning yellow-hazel eyes" had contrived against him as dark a plot as ever villain spun. But we must not tell the author's whole story; something must be left to excite the curiosity of the reader. Let us take leave, then, of the hero "bleeding, stunned, and senseless," and surrounded by infuriated savages on an island that was but seldom visited by ships. Let us part with the heroine in a condition that was scarcely less forlorn. She had by this time grown up into womanhood, and to save her father from the consequences of his lawyer's ignorance of the Statute of Limitations, had consented to marry a cold-blooded villain whose eyes were yellow hazel. Let us see the marriage contract drawn up and ready for signature, the wedding clothes ordered, the bridesmaids selected, and the bride white, wild-eyed, and nervous. Let us suffer the curtain thus to fall in the knowledge that our readers can, if they wish, very quickly and easily bid it rise again for themselves.

#### FRENCH LITERATURE.

THE fifth volume (1) of M. Wallon's History of the Revolutionary Tribunal is not inferior to its predecessors in importance and interest. Like them, it is an excellent example of the careful working up of details, the tragical significance of which is apt to be somewhat blunted by the legal formalities in which they are enwrapped; while, on the other hand, rhetorical heightening is foreign to the author's plan, and, indeed, would be a breach of his duty. No names of the first interest, with the single exception of that of André Chenier, diversify the dismal record of Messidor and of the latter *fournées* which punished the pretended conspiracy of the prisons. But the justice of the detestation with which the Tribunal has been regarded by all sober students of history continues to be proved amply. The revolution of the ninth Thermidor led, as is known, to the suspension of the Court, and the appearance of Fouquier Tinville before the Convention; but the Tribunal was reconstituted towards the end of the month, and fresh victims fell, though in smaller numbers, and on the whole on less iniquitous charges. The last chapters of the book give an account of the infamous excesses of Carrier and his daughter-tribunal at Nantes, and of the curious revolution which brought this provincial Court of blood before the very institution which it had originally copied. The volume comes to an end in the middle of this proceeding. M. Wallon's promises to be (with the exception of M. Lallie's mono-

(1) *Histoire du tribunal révolutionnaire*. Par H. Wallon. Tome 5. Paris: Hachette.

graph) the fullest and most detailed account, confined as it is to documentary and legal evidence, of how "Carrier came down to the Loire and slew." It is worth noticing that, though the *Noyades* proper and the "Republican marriages" rest on the clearest testimony, the so-called "Republican baptisms" appear more doubtful. Children were undoubtedly drowned in the general *Noyades*, but not, if would appear, singly, or as a special mock ceremony. The most atrocious criminal even of the French Revolution can, however, amply afford this deduction from the list of his claims to the title.

In noticing the first volume (*L'Indo védique*) of M. Marius Fontane's *Histoire universelle* (2) we stated certain objections to the form and plan of the work, which there is no need to repeat, but which apply equally to the second, *Les Iranien*s. The book, however, deserves the same praise as well as the same blame. M. Fontane writes well, and is evidently a person of remarkable diligence; nor is there any doubt that, accidents excepted, he will accomplish the formidable task which he has set himself of writing sixteen large octavo volumes on the history of the world in general.

M. Albert Babeau's *Village Schools during the Revolution* (3) is an excellent specimen of the monographs on historical subjects which are nowhere now produced in a more creditable manner than in France. M. Babeau appears to be an impartial politician and a temperate thinker generally. He shows, however, conclusively that the much-reviled ecclesiastical system of education was, for the most part, altered only for the worse by the Revolution; that the power given to the Communes of managing their schools on something like the School Board system had by no means good results; and that the chorus of demand at the beginning of the century for the restoration of clerical supervision was loud and almost unanimous. Of course M. Paul Bert and his friends may say that they will manage things better; it remains to be seen how far their boast is justifiable. M. Babeau has diversified his book with some curious citations; among others with extracts from a Republican Horn-book containing commandments, &c., modelled on the old ones, but rather innocently ludicrous than anything else:—

A la section tu te rendras  
Du cinq en cinq jours strictement ;

and

La dix août sanctifieras  
Pour l'aimer éternellement,

are delightful examples of the peculiar *bric-à-brac* which seems to cling inseparably to certain forms of political and religious emancipation.

M. Henri Belle (4) observes with much *naïveté* in his preface, "On trouvera dans ce volume plus d'une fois le nom de la France." It is quite true, and the result is not a little tedious. For our part, it seems to us that a traveller, whether he be Englishman, Frenchman, or what not, would do well to look on "spread-eagleism" as the one unpardonable sin; and we do not think we are uncharitable in saying that French travellers are specially prone to overlook this. However, M. Belle cannot be always dragging in "le nom de la France"; and then we have lively and interesting pictures of Greece, including many of the less visited parts, which he explored with all the advantages of his position of Secretary to the French Embassy in or about, as it would appear (for there is some confusion of dates in the volume), the year 1874. The book has the advantage of very fair and pretty plentiful illustration.

If M. Renan were not a person of irreproachable life and conversation, he would have had occasion to tremble when he knew that the author of *Sainte-Beuve et ses inconnues* was going to write a book about him. As it is, there is no scandal in M. Pons's volume (5), and we can only imagine that the author wished to wash out the memory of his successful, but discreditable, treachery to his former master by showing that he can do something else than play the traitor. Any other reason why he should have written the book it is not easy to discover. There is a little—a very little—personal gossip of the mildest kind, and the rest is made up of a sort of abstract of M. Renan's famous ecclesiastical history or romance, whichever it ought to be called. We cannot say that the book has any particular merit.

There are many dictionaries of French *argot*, and none is wholly satisfactory. The reason probably is that the jargon is, unlike the slang of other countries, in a perpetual state of transition. M. Rigaud's book (6) will be useful, more particularly to the students of naturalist novels, an improving class of literature which is apt to be rather puzzling to those who rely on the antiquated assistance of the late M. Littré.

There is something a little odd in a second edition of *Poésies inédites* (7); however, everything must have its title. These unedited poems of Lamartine appeared for the first time eight years ago and more, and we fear it is no slight sign of the fact that

Lamartine is an *étoile qui file* that they should only now have reached their second edition, or be thought worthy of ranking with the ordinary 18mo editions of the poet's works. There is merit in them, and, in the case of the unfinished epic of "*Le Chevalier*," considerable merit. But all the contents of the book—tragedies, epic, and lyrics—show the *mollesse* (there is no exactly equivalent English word) which has been fatal to Lamartine's reputation. The secret of this is not the mere sentimentality of the matter, obsolete as that is, but the flaccid character of the diction, the absence of nerve and force in the verse, the form moulded instead of carved, the lack of glow and colour. M. de Laprade's prefatory essay makes a noble fight for his master, but, we fear, a losing one. Together with these poems appear *Mémoires inédites* (8) in the same form. As has often happened with poets who have not kept their hold on the world, Lamartine's prose is less obviously wanting than his verse, though it has some of the same defects.

A sixth edition of a book on such a subject as education speaks pretty plainly for itself, and there is no need to do more than announce the appearance of such an edition (9) of Mme. Guizot's well-known letters.

M. Mézières has reprinted (10) the sketches of the war of 1870 which he contributed soon afterwards to the *Revue des Deux Mondes*, and which were first collected in 1871.

In consequence of the death of M. Joanne, the *Guide du voyageur en France* (11), of the excellent series which bears the name of that topographer, appears under the authorship of M. Richard. Some alterations appear to have been made in the arrangement. The prefatory matter which used to accompany each volume is not to be found here, and the information as to hotels, &c., is relegated to the index at the end of the volume. Otherwise the system seems unchanged, and the admirable maps and plans of towns which have always distinguished the series are forthcoming in abundance. Perhaps it may be doubted whether it was wise to attempt a road and railway book of so large a country as France, and one so excellently furnished with means of internal communication, in a single volume, even of nine hundred well-filled pages. But that is a question rather for those who know what the special demand is than for those who do not. It is sufficient to say that the information given, though necessarily somewhat stenographic, is wonderfully copious and very well selected.

Except on the general principle of the value of a *réclame* to any public character, Mme. Sarah Bernhardt must certainly have exclaimed, "Save me from my friends!" when she saw Mme. Marie Colombier's account (12) of her American travels. We use the complimentary title in both cases after the example of our author. The two amiable actresses open and close the book in each other's arms; but the interval is chiefly occupied by Mme. Colombier in showing how her friend persuaded her to go to America on false pretences; how she was completely indifferent to any one's comfort but her own; how very badly she often acted; how she cared for nothing but the *revette*, &c. &c. The biographer has also reproduced with great care large numbers of American caricatures of her heroine, has repeated with scrupulous frankness the strictures of American puritanism on her character, and has recorded, perhaps with historic conscientiousness, or perhaps for some other reason, how American women would have nothing to do with her. To do Mme. Colombier justice, she has applied with great impartiality her rather singular canons of good taste in writing. Here is her portrait of an American actress whom she names at full length, in which respect we shall not follow her. "Imaginez une femme n'ayant plus d'âge et qui n'a dû jamais avoir de beauté. Sa bouche est un trou noir, ses dents semblent des clous de girofle dans la cire à cacheter. Ratatinée, monifiée, elle porte perruque de chérubin," &c. It is probably not necessary to say anything more of Mme. Colombier's book, except that it has a preface by M. Arsène Houssaye which is not unworthy of it.

Lecturing in all its forms seems to be making no small headway in France. M. Paul Bert lectures on the happy times when all men will die atheists, and all dogs die vivisectioned; M. Coquelin cadet delivers comic monologues; M. Coquelin aîné delivers addresses of a more solemn kind on dead and living poets. The piece before us (13) is, in effect, a spoken review with abundant citations, and of a highly complimentary character. M. Eugène Manuel, for a minor poet, and we cannot give him any higher title, is lucky.

It is not generally true that it never rains but it pours, yet it seems to be true in some singular way of literature, and especially of French literature. Somehow or other nobody seems to attempt any literary task without somebody else attempting the same simultaneously. It is but the other day that we had to notice a verse translation into French of the First Part of *Faust*, and here (14) is another. There is no need to compare M. Daniel in any invidious sense with his predecessor. Both translations are very creditable pieces of work, and remarkable examples of the gain in flexibility

and range which ordinary French verse has made, thanks to the example of the great masters of the last fifty years. As might perhaps be expected, the book is strongest in the dialogue and weakest in the lyrical parts. M. Daniel has, indeed, rather a leaning to the pedestrian; and the poetry, as distinguished from the verse, of his model does not come out very well under his hands. But Englishmen have not much right to throw stones at French translators of *Faust*.

Messrs. Plon's functions as publishers to the central dépôt of almanacks must be not the least important part of their business. We cannot attempt to give individual notice to the portly bundle of year books which lies (15) before us. We have the plump *Liégeois*, the veritable triple *Liégeois*, which appears to have been constructed on purpose to exemplify the grey paper and blunt type of Mr. Browning's well-known line, though its contents are perfectly harmless; and several sizes of the venerable Mathieu de la Drôme, with his respectable countenance outside and much scientific information inside; and the *Comique*, which is not more comic than others; and the *Astrologique*, which tries to prognosticate wittily; and the "Good Catholic's Almanack," and the "Prophetic Almanack," and the "Ladies' Almanack," and the "Perfect Wine-Grower's Almanack"—the perfect wine-grower is not quite so unhappy this year as he has been for some time past—and the *Almanach pour rire*, and the *Sacré-Cœur Almanach*, and the *Mère Cigogne*, and the *Almanach lunaire*—which seems rather dull—and the "Scientific," and the "National," and the *Charivari*, and the special collection of M. Grévin's audacities from the same journal, and the *Almanach-Album des Célébrités contemporaines* (we wish the title were true, for they have got Théophile Gautier among the portraits), and the *Almanach du savoir-vivre*, which does not seem to vary its contents much from year to year, and the *Almanach de la bonne Cuisine*, and the *Almanach parisien*, of which perhaps the same may be said. Among all these, the *Almanach du voleur illustré* (16) alone scorns M. Plon, and publishes itself at its own office. It has some fair illustrations of the Tunisian expedition. But we cannot imagine where the dead Arabs come from. However, without them, the pictures might have had the same effect on the spectators as that picture of the High Street without gowmen which scandalized the Oxford Spectator's aunt.

Readers of that original, if rather inorganic, book, *Zéphyrin Casavan en Egypte*, which seems, since we noticed it last year, to have received the honour of an Academic *couronne*, will not be sorry to hear of the issue of another book by its author (17). M. Charles Edmond has changed his ground considerably, and has gone to Denmark for his scene. *Harald* is not, like *Zéphyrin Casavan*, a series of dissolving views, but a tolerably connected novel—at least in plan. However the author's apparently insuperable tendency to represent separate tableaux re-appears here. The least that can be said for M. Edmond is that he writes well and not like other people. M. Hector Malot's new book (18) depicts the struggles of a virtuous *inséparée*, left almost destitute by the sudden death of her father. Like many others of the author's books, it has a strong resemblance to the ordinary run of English novels. The writer of *Le mariage de Loti* has brought his extraordinary talent for depicting tropical scenery and manners to bear on a new country, Senegambia (19). It would be a very great mistake to confound M. Pierre Loti with the small fry of the shoal that splashes after M. Zola, though his ardour for description occasionally leads him rather too close to their unsavoury company. *Le roman d'un Spahi* describes, with singular force and power, the life of a French trooper in the deadly, and yet in a way seductive, climate and social atmosphere of Senegal, until his death in an obscure *razzia* against the tribes of the interior. The last scene is sufficiently ghastly, including, as it does, the suicide of a negro girl who loves the Spahi, after she has murdered their child. But the breadth and power of the drawing, as well as the poetry of the style, distinguish it altogether from the deathbeds of the naturalists. The letters of the Spahi's mother and of his betrothed from the far-away home in the Cevennes make an admirable contrast with the body of the narrative. There seems to be a mania just now in France for translations from the Hungarian. We must say that, if French writers cannot produce better Magyar novels than *Le comte Kappanyai* (20), they are quite right to translate Hungarian originals. It is one of those clumsy novels of incident in which the incidents are simply chronicled, and not in any sense acted; which have but little dialogue, and that of a lifeless and commonplace kind; and in which the story jolts and bumps along in a succession of jerks, the separate scenes being neither duly connected nor individually vivid. In short, it is a bad copy of the worst style of Dumas, or rather of "the young men" when Dumas left them to themselves. A scene in which the hero tumbles

down a precipice and is picked up for dead one moment, and a few pages later comes to life again, without rhyme or reason, is as nearly entitled to the credit of being the absolutely worst thing of its kind as anything we remember at the minute. *Les amours d'une empoisonneuse* (21) can hardly contribute much to its author's reputation even in the eyes of his most fervent admirers. It is apparently a fragment, and does not give promise of much good if it had been completed. We have also two volumes (22, 23) of short tales, or at least of tales of moderate length, before us. M. Price's is decidedly the better of the two, and some of the stories are amusing enough.

- (21) *Les amours d'une empoisonneuse*. Par E. Gaboriau. Paris: Dentu.  
(22) *Historiettes de France et d'Espagne*. Par G. Price. Paris: Calmann-Lévy.  
(23) *Le Monde et la Comédie*. Par M. Fournier. Paris: Calmann-Lévy.

#### NOTICE.

We beg leave to state that we decline to return rejected Communications; and to this rule we can make no exception.

#### THE UNITED STATES.

The Annual Subscription to the SATURDAY REVIEW, including postage to any part of the United States, is £1 10s. 4d., or \$7 58 gold, and may be forwarded direct to the Publisher, Mr. DAVID JONES, at the Office, 38 Southampton Street, Strand, or to Mr. B. F. STEVENS, American Agency, 4 Trafalgar Square, London. International Money Orders can be sent from any office in the United States, and Subscriptions, payable in advance, may commence at any time.

#### PARIS.

Copies of the SATURDAY REVIEW may be obtained every Saturday of M. FOTHERINGHAM, 8 Rue Neuve des Capucines.

The publication of the SATURDAY REVIEW takes place on Saturday Mornings, in time for the early trains, and copies may be obtained in the Country, through any Newsgent, on the day of publication.

## MINISTERS AT GUILDHALL.

AT Guildhall on Wednesday evening every one was smiling and everything was serene. A happy Ministry met a happy Corporation. It was the fortieth birthday of the PRINCE OF WALES, and Mr. GLADSTONE was able to contribute the interesting reminiscence that he had been present forty years ago, when, not the birthday, but the birth, of the PRINCE was celebrated. The incoming Lord Mayor welcomes the Premier of the day with impartial hospitality; and men of every party might be pleasantly reminded of the continuity of English institutions by the presence of a statesman whose roll of public services extends over so long a tract of time. The LORD MAYOR could honestly say that, even in a constituency politically antagonistic to Mr. GLADSTONE, every one cordially recognized his unwearied industry and commanding ability, and trusted in the magnanimity and wisdom which he could best display by leaving the City alone. Mr. GLADSTONE responded in a fitting key that the City had lasted virtually as it is now for five hundred years, and might last for five hundred years more if only it would always elect such men as the last Lord Mayor had shown himself and as the new LORD MAYOR was sure to be. The constitution of the City is at once unique and popular, and it is popular because it is unique; and these reciprocal courtesies of Prime Ministers and Lord Mayors are never wholly unmeaning. They are at least the expressions of amiable relations between two very different representatives of popular power; and they carry on the traditional history of England even when, as on the present occasion, the great guest of the evening has nothing very much to say. Sometimes the Guildhall banquet is made the occasion of an important Ministerial announcement, in which the secrets of coming legislation are revealed or the line of a new foreign policy is foreshadowed. But Ministers cannot always have something surprising to communicate; and this time Mr. GLADSTONE had nothing novel or unexpected to reveal, except that he had at last discovered that Boycotting in Ireland means the total ruin of the livelihood of those whom it affects. Everything in the world grows, even the PREMIER'S recognition of the real facts of Irish life. Mr. GLADSTONE was prudent enough to exhibit much reserve in his anticipations of the future of Ireland; but for the present he was cheered by the thought that the blow he has struck at the Land League is heartily approved in England, and that the tenants are flocking into the Land Court. This is a legitimate source of satisfaction to the authors of the Act; but it still remains to be seen how the Act will be received when it is properly tested. The rent is in many parts of Ireland too low for the real market value; and a just Court will have to raise rents as well as lower them. When in this class of cases an equitable and fearless decision has been received with loyal acquiescence by the tenants whom it affects, Mr. GLADSTONE will be better able than he can be at present to survey his work and pronounce it good.

Lord GRANVILLE had a little more to say than Mr. GLADSTONE had. He could make a personal reference to Mr. GLADSTONE himself, and dispel the notion that there was to be a new combination by which Mr. GLADSTONE was to be eclipsed, and Lord GRANVILLE was to shine in his stead. When Lord PALMERSTON was Mr. GLADSTONE'S age

he was thought to be too old for public life, and yet had ten years of public life before him; and certainly, if Mr. GLADSTONE could learn to take things as easily as Lord PALMERSTON took them, and jog along, repressing his supporters by the aid of his opponents, there is no reason why he, too, should not be Premier when he is eighty. It is unnecessary to look too far ahead, and we may be content with noticing that Mr. GLADSTONE'S colleagues think him perfectly competent to give them guidance or Ministerial existence for the present. After a careful perusal of Lord GRANVILLE'S observations on Egypt, it must remain doubtful whether he intended really to say anything pregnant with meaning about Egypt or not. All that he said was excellent, but its excellence principally consisted in its being very safe and very negative. We are not going to dissolve our partnership with France; we are not going to remove Egypt from under the shadow of Turkey; we are not going to cease applauding the KHEDIVÉ when his Government adopts a new measure of reform. This is, no doubt, the right policy for the moment. To ward off a crisis, to avoid disturbing the public law of Europe, to be cautious, but not to be jealous or suspicious, is the best course an English Foreign Secretary can pursue towards Egypt while things are as they are now. But there are serious dangers menacing the Egyptian Government and the joint protectorate; and it would have been reassuring if Lord GRANVILLE had thought it consistent with his official duty not only to recognize these dangers, but to express a conviction that by the pursuance of a wise policy these dangers would disappear. Lord GRANVILLE was, however, in too cheerful a humour to depress himself or his audience by noticing anything unpleasant. And he was optimistic about the Treaty of Commerce as about everything else. He fully adopts the theory of treaties of commerce which was entertained by CORDEN twenty years ago, and has now become almost exclusively the current theory of the day. They are valued, not for their economical, but their political results. They signalize and foster friendly feelings; and this is their real use. Whether they promote Free-trade is a subordinate, and perhaps a debatable, point. The Emperor NAPOLEON, as is evident from CORDEN'S Life, made the Treaty of 1860, simply to mitigate the alarm as to his designs which had sprung up in England after the Italian war, and CORDEN thought there was something almost treacherous personally to him as a negotiator in Lord PALMERSTON'S consenting his fortification scheme in the face of such a pledge of amity. It cannot be denied that trade does promote friendliness, and that treaties of commerce are in this way of some real use. But it can scarcely have escaped the notice of Lord GRANVILLE'S hearers that the nation which he described as of all nations that with which we are on the most friendly terms, is one which has not resorted to this stimulus of friendship, and that we have no treaty of commerce with the United States.

Mr. GLADSTONE referred to a great enterprise of the coming Session—the attempt to expedite the business of the House of Commons. The House does not, he said, get through its business at present, partly because it has too much to do, and partly because it does not know how to do what it tries to do. The quantity of work thrown on the House of Commons can scarcely be lessened by any change of procedure; but a change of procedure might

conceivably make it more competent to despatch the business it takes up. Mr. GLADSTONE made an appeal to Parliament and the country that the reform of Parliamentary procedure should not be regarded as a party question. Honest men of both parties may be trusted to welcome any proposals which attack recognized evils, suggest certain and legitimate remedies, do not create evils worse than those they remedy, and preserve the independence of minorities and the influence of constituencies. Sir STAFFORD NORTHCOTE is much too fair and moderate, and will be too well supported by the bulk of his party, to offer any potty and factious opposition to proposals of this character; but he cannot escape from the duty of seeing that this is the character of the proposals actually made. On any point of Parliamentary procedure and of the traditions and of the customs of the House of Commons anything said by the SPEAKER must command the most serious attention, and he gave it as his opinion at the Guildhall dinner that some kind of reform is highly desirable. And the evil for which he desired a remedy was a very distinct and precise one. He came down from the region of vague generalities to the region of specific facts. The mischief of which he complained was that there is a considerable body of members who, under cover of rules framed for other men and for other times, have asserted for themselves the monopoly of the right of public speaking, and have contrived to stifle the voice of the House, and to paralyse its action. The mischief, then, is that the wrong men will speak at the wrong time and at the wrong length. It is a mischief that seems at first to be of a comparatively simple kind; and the general body of the House of Commons would be very happy to cure it if possible. But it is a mischief exceedingly difficult to cure. Obstruction in its familiar Irish form may be dealt with, but obstruction is only one form of irrelevant loquacity. The *clôture* would prevent speeches being made beyond a certain time, but it would not prevent the allotted time being usurped by the wrong men. Nor is it easy to see how any general rule could be laid down that would hit the wrong men and would not also hit the right men. The difficulties in the way of the reform of Parliamentary procedure are difficulties inherent in the subject-matter itself. Wisdom, tact, and inventiveness may overcome them; but to show that they exist is not to exhibit any kind of party spirit that deserves to be reprehended.

#### M. FERRY'S LAST DAY.

THE French Chamber of Deputies is as fond of delays in the matter of divisions as the English House of Commons is in the matter of debates. The discussion on Tunis was a model of brevity; but, as soon as the last speaker had sat down, one motion after another was put and negatived until it seemed as though there were no one element in the question about which a majority of the Deputies were of one mind. The Ministerial majority, for which M. GAMBETTA has been so long searching, might have been expected, in the first instance, to take the shape of an Opposition majority; and probably, if M. GAMBETTA himself had taken part in the debate, this end might have been brought about. But M. GAMBETTA had maintained an unaccustomed silence. The undisputed leader of the Chamber had not said one word which might indicate to his followers what it was that he wished them to do. Under these circumstances, they could only fall back upon doing nothing. They would not have the inquiry proposed by M. CLÉMENTEAU; and, indeed, when the universal desire is to see the last of the present Cabinet, who could wish to be occupied for weeks or months to come with the record of its misdoings? They would not condemn the Government without inquiry. They would not pass to the order of the day, because that would have been taken as a partial absolution of Ministers. They would not refer the proposed resolutions to a Committee which should pronounce upon which of them a decisive vote should be taken. They would not consent to let the debate end without any resolution at all. They were evidently tempted by a resolution declaring that, as things stood, the Chamber would not hamper the military operations in Tunis, but when it came to the point this seemed too favourable to the Ministry, and was rejected like its fellows.

Whether M. GAMBETTA's intervention at this point was dictated by despair or calculation, it exactly answered its purpose. Things had come to a point at which it was plainly impossible that they could remain without serious injury to the character of the new Chamber. M. GAMBETTA may without injustice be supposed to have had two things in view—to create a majority out of chaos, and to give unmistakable proof that nobody but himself was equal to the task. The rejection of twenty-six motions in a single sitting had demonstrated the existence of chaos, and it was a fair inference that if either Ministers or the opponents had been able to evoke order out of it they would not have allowed their power to lie unused. M. FERRY would have got a vote of confidence if he could. M. CLÉMENTEAU would have carried the appointment of his Committee if he could. But, as neither party could do what they wished to do, the ground was clear for M. GAMBETTA. If it could be shown that he had but to rise and indicate how he wished the Chamber to vote to ensure its voting as he wished, he would have proved himself the indispensable leader of a Chamber which no one else could lead. It was not necessary for M. GAMBETTA to subject his influence to any excessive strain. He did not wish either to condemn the Cabinet or to acquit it. The former course might have been too open a challenge to M. FERRY to prove M. GAMBETTA's complicity with the Tunis expedition; the latter might have been held to pledge him to admit that late justified innocent, M. FERRY, into the new Cabinet. All that M. GAMBETTA had to do, therefore, was to compose a platitude, and in this he succeeded so completely that it is strange that sixty-eight deputies should have been found to vote against it. But even when these had been deducted the majority in favour of the motion exceeded three hundred. By 355 votes to 68 the Chamber declared that it is determined to carry out the treaty signed by the French nation on the 12th of May, 1881.

The reasons which M. GAMBETTA gave for proposing this resolution were good so far as they went. By taking no part in the debate he had greatly contributed to bringing about the "painful spectacle" which he lamented. Any one of the twenty-six motions vainly submitted to the Chamber might probably have been carried if he had thought fit to rise and support it. He was directly responsible for the "avowal of impotence" which he deprecated, because, though he might have prevented the avowal, he did not choose to do so. The reason why he did not prevent it is less clear. M. GAMBETTA contented himself with declaring that he had not thought it his duty to take part in the debate; and he apparently thinks that the statement of a fact and the giving of a reason are, in his mouth, the same. At least he refers later in the speech to the reasons he has just given; but, when they are examined, they turn out to be nothing more than assertions that he had not originally intended to take part in the debate, and that the speeches he had listened to had supplied him with no ground for changing his purpose. The deputies were too grateful to him for interfering when he did to find any fault with him for not interfering earlier. They knew at last what would please M. GAMBETTA, and in the unwonted sense of security to which this consciousness gave birth, they could for once vote and be thankful. Thus by a colourless resolution the FERRY Cabinet fell, if a Cabinet can rightly be said to fall which has first thrown itself down. The French public are so well pleased, however, to get rid of it, that they will not be critical about the method by which they have got their way. A sense of relief seems to have come over everybody now that the stage is at length cleared for M. GAMBETTA. Ever since the definitive triumph of the Republic he has been a Minister behind the scenes, and, patient as Frenchmen have shown themselves of this strange state of things, they cannot but feel glad that it is over. The simple announcement that M. GAMBETTA has been sent for is for the moment enough to convert the greater part of them into political optimists.

There is a limit, however, to the possibilities of speculation, and it is one that in M. GAMBETTA's case has long been reached. For months past every combination that either his Cabinet or his policy can conceivably show has been discussed over and over again, and it is not worth while to take up the theme once more in the short interval which now divides us from something like certainty. M. GAMBETTA's choice of Ministers will be eagerly gone

ever in order to form some estimate of the lines on which his administration will be built. According as he picks out moderate or extreme colleagues, moderate or extreme measures will be expected of him. It is by no means certain, however, either that this particular indication will be given, or that it will be worth much if it is given. The old divisions in the Left seem for the time to have appeared; and if M. GAMBETTA cares to form a broad-based Administration, he will, to all appearance, be very well able to do so. In that case the antecedents of different Ministers will point in different directions, and all that will be clear will be that, if Ministers are to be consistent with their past selves, they must vote on different sides upon every important Government measure. There is another possibility in reserve, and that is that M. GAMBETTA may frame his Cabinet on one principle and his measures on another; that the promotion of moderate men may be meant to disguise the adoption of an extreme policy, or the adoption of a moderate policy be meant to sweeten the promotion of extreme men. The truth is that in these respects M. GAMBETTA is altogether a dark horse. The world knows what he can do under extraordinary circumstances, and how much he can say under ordinary circumstances, but it knows nothing more. If he were succeeding to a dictatorship, it might form a guess of the use to which he intended to put it, but when the place into which he steps is that of a nominally constitutional Minister, it has no data upon which to found a prediction. Like the French public, it can only rejoice that the experiment which has so long been delayed is now to be tried; that power and responsibility are once more to be vested in the same hands; and that M. GAMBETTA's great influence over his countrymen is for the future to be wielded in the character of a Minister and not of a wire-puller. From the day that M. GAMBETTA takes office the affairs of the Republic will wear a new complexion. It may be either smiling or threatening, but it will at least be genuine.

#### LORD HARTINGTON ON THE ENGLISH LAND QUESTION.

MR. FAWCETT and Lord HARTINGTON are the only members of the Government who have recently delivered useful or instructive speeches. Mr. GLADSTONE's exuberant rhetoric, while it excites the passions of his partisans, seldom fails to increase the uneasiness with which his impulsive policy is regarded. Sir W. HARCOURT, though he is both amusing and eloquent, generally devotes himself to party controversies and to the opportunities which they furnish for personal recrimination and for sparkling repartee. Mr. FAWCETT preferred to explain to his constituents the administrative measures which he has introduced, and to warn them against some popular fallacies which are now commonly propounded. As a political economist who believes in the doctrines which he teaches, Mr. FAWCETT objects to the substitution of legislative rules for dealing with property for the discretion and personal interest of the owners. The managers of the Farmers' Alliance will not be encouraged by Mr. FAWCETT's reference to their selfish and piratical projects; but the language of a Minister who has not a seat in the Cabinet affords no direct indication of the purposes of the Government. Greater significance is necessarily attached to the most careless utterance of Mr. GLADSTONE, who has encouraged the projectors of schemes for robbing landowners by the promise that large changes shall be introduced into the present laws of land. He perhaps only refers to the abolition or modification of the power of settlement; but his words may also imply an intention of transferring to the occupier in Great Britain, as in Ireland, a part of the property of the owner. Mr. GLADSTONE's declaration that he would never propose an Irish Land Bill for England might restore confidence if it proceeded from any other statesman; but the Farmers' Alliance has interpreted Mr. GLADSTONE's words to mean that the English Bill is to effect the same objects with the Irish Land Act by the use of a different phraseology. It was not certain whether these calculations might not be justified by the result; but it is now clear that the Cabinet has not agreed to any project of agrarian spoliation.

Lord HARTINGTON's speech at the agricultural dinner

at Yeovil as the first official answer which has been given to Mr. HOWARD's predatory proposals. It was probably of deliberate purpose that a vindication of freedom of contract was addressed to a mixed audience rather than to a body of political supporters. The Conservative members for the county judiciously released Lord HARTINGTON from the restrictions which are formally imposed on speakers at agricultural meetings. With less felicity Mr. PAGET expressed a hope that Lord HARTINGTON might hereafter join a coalition of moderate members of both parties. It has from ancient times not been thought expedient for the fowler to spread the net in sight of any bird. Some of the Whig aristocracy have, with abundant cause, already seceded from the party which has appropriated their ancestral name; but large proprietors who are still nominally Liberals resent the premature expression of their own secret apprehensions. In answer to Mr. PAGET Lord HARTINGTON quietly repudiated the implied suspicion that he is separated from any section of his colleagues by differences of political opinion. The real state of the case may be approximately ascertained by a comparison of the recent declaration of two members of the Cabinet. Mr. CHAMBERLAIN said that the land laws of England are nearly as faulty as those which formerly existed in Ireland. It follows that he would forcibly alter the relations among the different classes who are connected with land. Lord HARTINGTON thinks legislative interference between landlord and tenant neither necessary nor justifiable. It is difficult to suppose that Mr. GLADSTONE, who lately designated Lord HARTINGTON as one of his successors, will run the risk of losing his official support by proposing any wild agrarian project. Lord HARTINGTON adheres to the opinion which he formerly expressed, that the tenure of land should be so far altered as to diminish the chance of its belonging for considerable periods to limited owners who may have neither the desire nor the inclination to expend capital on improvements. The economical inconvenience, though it has been greatly exaggerated, exists to some extent; and it is not certain that the additional facility of encumbering land which would result from a general practice of ownership in fee simple would equally discourage expenditure of capital on the land. There can be no doubt that legislation on the subject is within the competence of Parliament.

Passing from a question on which there is no immediate controversy, Lord HARTINGTON declared in the plainest language that "he should hesitate a long time before he should recommend Parliament to lay down, in any compulsory enactment, the manner in which landlords and tenants hereafter shall act." Although he objected in some respects to the provisions of the Agricultural Holdings Act, Lord HARTINGTON, with a candour which might advantageously be imitated by his colleagues, expressed his firm belief that it was honestly intended, and that it had produced good effects. If his words are to be literally construed, he would object to making the Act compulsory where landlords and tenants have agreed that it shall not apply; but it is possible that his language may on this point have been open to misunderstanding. It will not be easy for the agrarian agitators to answer Lord HARTINGTON's challenge that they should test the efficiency of the arrangements which they wish to make compulsory. Land, he says, is lying idle in many parts of the kingdom; and the owners are anxious to obtain tenants on almost any terms which may be proposed. Why should not the enterprising capitalists who are supposed to be anxious to invest their money in cultivation take the vacant farms on conditions which they might almost prescribe at their pleasure? The argument is in itself forcible or conclusive; but its principal weight is derived from the authority on which it rests. As long as one of the principal members of the Government publicly uses the language of common sense and common honesty, it may be inferred that no Irish Land Act will be imported into England. Lord HARTINGTON expressly admitted that there was no reason why landowners, like any other class of the community, should not be entitled to relief if they were unjustly taxed. Mr. GLADSTONE lately declared that, if landlords at any time profited by a readjustment of local and general taxation, they would to that extent be quarantined on the Exchequer. It is to be regretted that one of the most powerful of Ministers should live in an atmosphere of angry paradoxes.

The same number of the *Times* in which Lord HARTINGTON's speech was reported contained a letter with the signature

of "Land Agent," which illustrates the practical meaning of compulsory compensation for unexhausted improvements. The writer, who states that he has had large experience in the South of England, and in districts where the local custom coincides with the proposed law, asserts that the land is left in worse condition where the practice prevails than in other parts of England. "One of the most mischievous results of the system has been the creation of a class of tenant-right valuers (most of them tenants themselves), who value everything in favour of an outgoing tenant, and refuse to make any allowance to the landlord or incoming tenant in respect of defects of cultivation or neglect of repairs." These are the assessors who are, according to the Farmers' Alliance Bill, to be appointed by the Boards of Guardians. "Their sole endeavour will be to run up a bill for what they will be pleased to call unexhausted improvements, to the extreme injury of the incomer (by crippling his capital), and, as a consequence, to agriculture generally." In almost all parts of England permanent improvements are made by the landlord; and, if the tenant in any case undertakes the burden, he can protect himself by agreement, and his outlay will be considered in his rent. The land agent has found, like others who have had similar opportunities of experience, that tenants are for the most part unwilling to take leases by which both parties would be legally bound. It is true that even a lease affords the landlord insufficient protection, because he has seldom a practical remedy if the occupier proposes to dissolve the contract; but the tenant incurs no corresponding risk, and he has for the duration of the term full enjoyment of the results of any beneficial outlay which may have been made. In many parts of England there are no unexhausted improvements, except perhaps the manure which may have been put upon the land in the last year of the holding; yet in every instance the landlord would have to pay for unexhausted improvements, after perhaps incurring the expense of litigation before a packed tribunal. The Farmers' Alliance has almost abandoned the shallow pretence of endeavouring to make the land more productive. Its present object is merely to enrich its members, and other present occupiers of large farms, at the expense of the landlords, according to the anomalous Irish precedent. They will not find it convenient to notice the statements and arguments of the "Land Agent"; but their sanguine anticipations of successful robbery will be checked by Lord HARTINGTON'S plain and manly language.

#### THE FRENCH DEBATE ON TUNIS.

THE debate in the French Chamber was prolonged through four sittings, and was tolerably exhaustive within the very narrow range which circumstances had assigned to it. It was an inquiry into the past history of a Ministry which had already proclaimed itself to be dead, and no process of Ministerial duplicity or incapacity could kill the slain. It is only when the existence of a Ministry is at stake that there can be any real life in an inquiry into what it has done. The future, again, of the Tunis expedition is of far greater importance to France than the past; but it was impossible to discuss the future in the presence of Ministers who declared that, whatever the future might be, it was a future with which they had nothing to do. The inquiry into the past, however maimed and imperfect it might be, was not without value. It threw some light on the origin and nature of the expedition, on the relations which ought to subsist between a French Ministry and the Chamber, and on the administration and constitution of the French army. As it was the conduct of the FERRY Cabinet which was chiefly under review, it was on this head that the greater part of the oratory of the opponents of the Cabinet was expended. The charges against the Ministry, in addition to those relating to the origin of the expedition and the administration of the army, were that it had deceived the Chamber by representing as a little affair what was really a very big affair; that it had undertaken a war without authorization; and that it had waged war without securing any result of the slightest benefit to France. The charge of going to war without authorization was that which was pressed with the greatest earnestness by the Extreme Left, as they think that no guarantee of the supremacy of Parliament is so precious as that which makes it impossible that the cost and hazards of war shall be undertaken without the

sanction of the representatives of the nation. The discussion served to show that this guarantee is almost entirely worthless. A Parliament can always commit a nation to a war if it wishes to do it; it can make wars which technically are not wars; and it can challenge an antagonist by acts of war which do not lead to war merely because the challenge is not accepted. The Tunis expedition exposes France to all the dangers of war. At a great cost and with great loss of life, a large French army is campaigning on foreign territory; but technically it is not war when the Power places forces, however large, at the disposal of another Power which is occupied in suppressing an insurrection against its authority. For a reply to the charges of having deceived the Chamber, and of having attained no success, M. FERRY drew liberally on that audacity of invention which comes so easily to a Minister who can say anything because his responsibility as a Minister is at end. The Ministry, he asserted, had not spent more than Parliament had sanctioned, because Parliament had given it *carte blanche* to spend anything it pleased. The Chamber, and perhaps the country, may have thought that everything was ended with the Treaty of May; but the Ministry was not so simple. It knew all along that there must be a great autumn campaign, and if it did not say so, that was because wise men who are implicitly trusted must be allowed to keep their wisdom to themselves. As to having done nothing hitherto, M. FERRY indignantly repelled so wanton an accusation. The Ministry, far from doing nothing, has achieved an enormous political triumph, and has won a superb military success. It has struck a mortal blow to that Mahomedan fanaticism which ever since the Russian war has been imperilling the civilized world. It has got different bodies of French soldiers to concentrate on Kairwan, and the march of these soldiers is a triumph of French arms which has seldom been rivalled, and never been surpassed, by the greatest of French victories. Austerlitz and Jena pale before these sublime marchings. No less than seven thousand camels had to accompany the troops, and the camels alone will obliterate the memory of Gravelotte and Sedan. M. FERRY could not resist the pleasure of having one last long hearty laugh at the expense of the Chamber which was demolishing him and his Ministry.

M. FERRY tried hard, and not unsuccessfully, to show that the policy of creating a French Protectorate in Tunis was not specially his policy, but had been the policy of every French Ministry since the days of GUIZOT. It is not, however, necessary to go into historical disquisitions; for it is incontestable that the Chamber, by ratifying the Treaty of May, made it once for all the policy of France. If the French nation is not to be held to have accepted a protectorate with all its advantages and all its liabilities, the sanction of Parliament has no meaning in France. It was by concentrating the attention of the Chamber on this national act that M. GAMBETTA got the Chamber out of the difficulties into which it was plunging through its uncertainty as to how it would deal with a Ministry which could not be dealt with. To forget what the Ministry has done, and to think only of what the nation has done, was a suggestion which was welcome, not only because it came from M. GAMBETTA, but because it drew a distinction between the Ministry and the nation which was agreeable to those who were anxious that the Ministry should not escape some kind of censure. But, apart from the general question of the policy of a protectorate, stood the more special question of the steps by which, on this final occasion, the policy had been started into life. Here M. CLÉMENTEAU attacked the Ministry with great force and point. The expedition against the Kroumirs had been converted into an expedition to extort a treaty from the Bey, because, as M. ST.-HILAIRE explained, the relations between France and the Bey had recently been very unsatisfactory. M. CLÉMENTEAU did not go into any of the scandals and rumours as to the secret history of the expedition which have been the creation or amusement of the gossips of Paris. He never went out of the Yellow Book; and in the Yellow Book itself he found the clearest evidence that a protectorate was imposed by force on the Bey, because M. ROUSTAN had already made demands on the Bey which he had not a shadow of justification for demanding, except on the supposition that a protectorate already existed. He had insisted that a French Company should have the monopoly of every railway in Tunis, that a French Company should hold land in Tunis of the size of a French department

under the exclusive protection of the French Consul, and that a *Crédit Foncier* should be established, which the BEY declared would bring the French and the Mahomedan law into conflict in every part of his dominions. According to the traditions and customs of minor French diplomatists, M. ROUSTAN was quite right in all he did. They live their lives in countries like Tunis with the one persistent idea that it is the business of a French Consul to get everything by manoeuvring and bullying which can be got for Frenchmen, and to prevent anything of the same sort being got by the Consuls of other Powers for their countrymen, and the French Consuls have a well-grounded conviction that their Foreign Office will always back them up as far as they dare. It is as well that what M. ST.-HILAIRE meant by the bad previous relations between the BEY and France should be once for all clearly understood. What M. ST.-HILAIRE meant was that the BEY had not acted as if he was under a protectorate when he was not under one. His mind had to be opened and his views enlarged by the decisive arguments of the sword and the pistol.

It was principally reserved for General FARRE to answer the attacks that had been made on the administration of the army. He apologized for the blunt soldierly way in which he made his statement, and for his utter deficiency in all the graces of oratory. But this statement did not need the graces of oratory. Rhetoric is superfluous when the answer to every charge is a blank denial. To everything his adversaries alleged General FARRE replied that it was not true. It had been said that there had been much sickness; there was very little sickness. It had been said that there had been many deaths; on the contrary, the death-rate was remarkably low. Far from there being insufficient hospital accommodation, there had been provided hundreds of beds more than were wanted. There was said to be a short supply of doctors; there were doctors in abundance; and if there ever was a danger of the supply falling short, it was when the doctors themselves tried to get home, a manoeuvre which General FARRE summarily stopped. No medicine and no tea was another charge. General FARRE had sent out tons of medicine, and had personally got up the names of the different medicines sent. Although tea was not a national beverage, General FARRE had himself thought it might be useful in Tunis, and had sent out stores of tea before any one had thought of asking for it. General FARRE had not only an answer, but a complete answer, to everything; and it was conclusively shown that the reports of all the generals in command amply confirmed what the Minister had stated. Everything was reduced at last to a conflict between the statements of high officials on the one hand and the statements of newspaper Correspondents on the other. Outsiders have no possible means of forming a judgment; but long experience of similar conflicts may suggest to Englishmen that a very large deduction must be made from the statements of newspaper Correspondents, and a small, but not wholly insignificant, deduction must be made from official declarations. As to the charge that the mode in which the contingents furnished for the expedition had been drawn from the army had been such as to break up the military organization of France and leave mere skeletons of battalions, General FARRE replied, with considerable success, that those who made this charge did not understand what the present military organization of France really is. If a great war had broken out, the skeleton regiments would have been instantly filled up, not with recruits, but with reservists. In time of war it is not the men serving their time, but the reservists, that make the French army strong. This is a time of peace, and if it is found that the regiments are now very weak, this is what always happens and must happen at a particular time of the autumn. For the short period that elapses between the autumn reviews and the coming in of the recruits of the year, every French regiment falls to one half of its strength. The explanation is that the Government spends as much money as it can afford on the autumn reviews, and makes up by spending as little as it can for a few weeks when the autumn reviews are at an end. This accounts for the thinness of regiments at the present moment; but, as General FARRE candidly stated, it has very little to do with Tunis; and the radical defect of the present system is that it has no army fit for exceptional service such as that which is now required.

#### IRISH LAW APPOINTMENTS

LORD O'HAGAN'S retirement has caused some surprise, though he may perhaps be well advised in deviating from the more common usage by leaving the Bench while he is still in the full vigour of his faculties. His services will still be available in the judicial business of the House of Lords; and he may probably support in debate the party to which he has long been attached. His abilities and his character have always commanded respect; and he has been exempt from the foibles which are more or less justly attributed to his countrymen. Ireland has, during the present generation, achieved an instalment of Home Rule by excluding English candidates for high judicial offices. Thirty or forty years have passed since an alien Irish Chancellor consoled himself for the want of more eligible promotion at home. Before that time it was almost necessary to employ Irishmen in the second office in the kingdom, inasmuch as the Chancellor had the management of the Irish House of Lords. When the local Parliament ceased to exist, it was perhaps thought expedient to promote the fusion of the two kingdoms by giving the Great Seal of Ireland to English lawyers. The first Lord KILDESDALE, who had held the office of Speaker, acquired a high judicial reputation as Lord Chancellor of Ireland. Lord MANNERS owed his succession to the same dignity to his connexions as a cadet of the family of RUTLAND, son of the Archbishop of CANTERBURY, and brother of the SPEAKER. Lord PLUNKETT, as an eminent Irish lawyer, and as one of the greatest orators who ever sat in the House of Commons, had a higher claim to the first judicial office. He had been disappointed of the more desirable place of English Master of the Rolls by the unworthy deference of the Minister to the alleged jealousy of the English Bar. Lord PLUNKETT's term of office ended in a mortifying humiliation inflicted upon him by Lord MELBOURNE and Lord JOHN RUSSELL, who required his place for their Attorney-General. Sir JOHN CAMPBELL, foreseeing the imminent fall of the Whig Government, was determined not to return for an indefinite time to private practice at the Bar. He therefore insisted on the creation of a vacancy which would entitle him to a peerage; and Lord PLUNKETT had to make way for the unwelcome intruder, who had scarcely time to take his seat in court before he retired with the outgoing Ministry. The last English Chancellor of Ireland, and perhaps the greatest lawyer who ever occupied the post, was Sir EDWARD SUGDEN, afterwards Lord ST. LEONARDS. Since his time the office has always been held by Irishmen, for the most part capable and eminent. The list which ends with Lord O'HAGAN includes the names of Sir JOSEPH NAPIER, of Mr. BREWSTER, and Dr. BALL. No Irish Law Lord has been created between Lord PLUNKETT and Lord O'HAGAN.

Mr. LAW, who now succeeds to the Great Seal, has a high reputation as an Equity lawyer, and he has recently done service to his party by his considerable share in the conduct of the Land Bill through the House of Commons. No merit is more fully appreciated by the Minister who at present regards as the worst of crimes any interference with the operation of his favourite and questionable measure. It is not known whether Mr. LAW anticipated the conversion which Mr. GLADSTONE is supposed to have undergone nine or ten months ago. Either through dislike of novel legislation, or, more probably, in consequence of inability to understand the provisions of the Bill, nearly all Mr. GLADSTONE's colleagues confined themselves to the support which they could give their chief by steady voting. Mr. FORSTER had had enough to do in passing the Coercion Bill, and the HOME SECRETARY, who is supposed to have the chief conduct of Irish business, had contributed his share by carrying the Peace Preservation Act. The English Law Officers naturally left the management of details to their Irish colleagues. Mr. LAW and Mr. JOHNSON were perhaps not equally matched against their principal opponents, who happened to have been their predecessors in office. Mr. GIBSON and Mr. PLUNKETT displayed great Parliamentary ability in their conduct of the Opposition; and they did no disservice to a cause which was substantially just by their uniform moderation and candour. The discussion was necessarily in a great measure professional, and scarcely any layman, except Mr. GLADSTONE, who was intended by nature to be an advocate, took a prominent share in the controversy. Mr. LAW has on the whole fairly

earned his high promotion, and the SOLICITOR-GENERAL has an indisputable claim to the office which is vacated. Mr. PORTER, now Solicitor-General, is said to be a good lawyer; and it is hoped that he will acquire a still more valuable qualification by succeeding Mr. LAW in his Parliamentary seat. Irish and Scotch Law Officers almost always take the earliest opportunity of retiring with judicial appointments. The largest practice which they can obtain is trifling in comparison with that of successful English lawyers; and, if they have seats in the House of Commons, they necessarily sacrifice a large part of their professional income. Economical purists maintain that in both countries the judicial staff is unnecessarily large; but no Minister who regards his own popularity will interfere with the modest provision on which local lawyers not unnaturally count.

There is at present great excitement among Irish solicitors and in the junior ranks of the Bar. Two lawyers have been appointed to new offices as Land Commissioners, and each of the Sub-Commissions has a barrister as President. Any chance of justice to Irish landowners must depend on the professional element in the Commissions. Uniform experience shows that technical familiarity with any subject-matter of litigation aggravates the general unfitness of laymen for judicial posts. An expert is of necessity biased on one side or the other; and in the administration of the Land Act the farmers and land-agents will probably in almost all cases incline unduly to the cause of the tenant. The Professor who has caused so general a shock by his first judgment as a Sub-Commissioner might possibly have given the same decision, though he would not have alleged the same reasons, if he had been a qualified judge. Lord MONCK, whose authority and knowledge of agrarian matters would ordinarily entitle his judgment to respect, expresses the opinion that in the CRAWFORD case the rent was properly reduced; but, whatever may be the merits of the particular question, the Sub-Commissioners' reasons are iniquitous and indefensible. The gaiety and popular manners which newspaper admirers applaud would be well exchanged for serious consideration of the nature of property. The adjustment of rent to the good or bad cultivation of a farm by the tenant is either a gross misapprehension of the law or a conclusive proof that the Land Act is as faulty in detail as it is vicious in principle. It is true that the Chief Commissioner, who is a lawyer of experience and reputation, enunciated in his opening address almost equally objectionable doctrines; but, until a judicial decision has made the rights of the owner proportional to the wants of the tenant, a general proposition, however fallacious, may not have done practical harm.

The number of places to be distributed among Irish lawyers is necessarily finite; but the prospective amount of petty litigation seems to have no visible limit. The Commissioners, immediately after their appointment, began to canvass for employment by circulating a statement of the advantages which, as they truly said, were offered by the Act to tenant-farmers. It was perhaps no part of their business to inquire whether just legislation would not also have secured the rights of owners. The invitation to litigants was renewed in a still more attractive form by Justice O'HAGAN's strange announcement that rent would be fixed on such terms as to enable the tenant to live and thrive. If the Judge's language is literally interpreted, it seems to follow that the smallest holders are hereafter to sit rent-free. A tenant of fifty acres may live and thrive at a rent on which ten cottagers, each holding five acres, can barely subsist. It is probable that an ill-judged phrase will be qualified in the practical administration of the Land Act; but there is no doubt that the supposed promise of the Commissioners has tended to cause or to increase the intolerable pressure of litigation. Some of the advisers of the peasantry have furnished them with an additional and characteristic motive for bringing the greatest possible number of claims into Court. The tenants are told that, until a fair rent is judicially fixed, they are entitled to withhold rent altogether. If they act on the suggestion, the notorious decree of the Land League will be as generally obeyed as if it had been in the first instance universally accepted. The fees of the lawyers employed will probably not be large; but the insufficiency of their gains in each separate case will be balanced by the enormous amount of business. One result of the Land Act is

to render all the landed property in Ireland contingent on the result of a lawsuit. It is not improbable that attempts will be made to extend to Great Britain the blessing of ubiquitous and perpetual litigation.

#### ST. PAUL'S INDUSTRIAL SCHOOL.

THE charges which have lately been brought against the St. Paul's Industrial School are sufficiently remarkable in themselves. If only a part of them can be made good, they disclose a series of systematic cruelties which would be thought exaggerated in a sensational romance. In the indictment prepared by Mrs. SURE it is alleged that boys have been locked up for days and nights in a room where the cold is so intense that coals freeze; that weak children have been made to carry their beds on their heads for long periods, and even in winter to wash their sheets in cold water, standing in the open yard without shoes or jackets; that the hunger of the boys has been so keen that they have stolen the dog's food, and hid behind doors to seize the officers' leavings as the plates are brought from the table; that the clothing of the children has been ragged, dirty, and insufficient, and the punishments cruel and excessive. If the evidence of the boys who were examined before the Special Committee of the London School Board is anywhere near the truth, these charges do but convey very generally and imperfectly what has actually been going on in the school. One witness speaks of boys who were made to pass the night with their feet in irons, these irons being too small and so scratching the skin off their ankles; of one boy who died because his feet were allowed to rot off; of another who died of starvation because he was too ill to eat the school meals, and no others were provided for him. A second witness stated that one boy took poison "because he had been so set upon" by the officials; and a third told an agreeable story of a boy who had been caned the day before he died because he was too ill to make enough sacks. The financial management of the school, according to the case alleged against it, was quite on a level with its general administration. Cases of absconding, it is said, have been frequent, but they have not been reported, and the Government and the School Board have been charged for the maintenance of the absentees. Although a sum of 3*l.* is allowed by the School Board for the outfit of each discharged boy, clothing of less value has been bought at a slop-shop and the balance appropriated. The loaves served out for the children have been changed for cakes which are eaten by other people, and large joints of meat have been bought for the use of the governor and his family and the officers and set down to the boys' account. This is merely a selection from the accusations which Mrs. SURE believes herself able to make good against the school.

We have called these charges sufficiently remarkable in themselves, but it is no exaggeration to say that they are less remarkable than the manner in which the London School Board has been pleased to deal with them. After all, cases of gross cruelty do occur from time to time, and, horrible as the state of things which existed in the St. Paul's Industrial School was, if there is any foundation whatever for the charges made against it, it can be only too easily paralleled in the records of criminal trials. But the attitude which the London School Board has taken up towards the charges in question is happily without a parallel. Attention was first drawn to the St. Paul's Industrial School by a prosecution at the Thames Police Court of some of the boys for attempting to set the school on fire. The remarks of the magistrate virtually came to this, that, considering the way in which the boys had been treated, he did not much wonder at what they had done. At the first meeting of the London School Board after the recess Mr. SCRUTTON, who is one of the managers of the school, and the Chairman of the Board's Industrial Schools' Committee, was asked what action the Committee were going to take in the case. Mr. SCRUTTON promptly replied that they were going to take no action beyond prosecuting the boys. Later in the same day it was proposed to appoint a Committee to inquire into the management of the school, to which Mrs. SURE moved, as an amendment, that the HOME SECRETARY should be asked to withdraw the certificate from the school, which was equivalent to substituting the Home Office for a Committee of the School

Board as the authority by whom the inquiry should be made. Mr. SCRUTTON had, with much prudence, gone away after saying that he meant to do nothing in the matter; and, in his absence, his friends made repeated efforts to keep the matter out of the HOME SECRETARY'S hands. In the end, however, Mrs. SURE's amendment was carried by a majority of one, the VICE-CHAIRMAN and Mr. LYNLPH STANLEY protesting to the last, and predicting that the resolution would certainly be rescinded the following week. Accordingly, on the 13th of October, Mr. STANLEY moved that the resolution of the previous week should be rescinded, on the ground that the most dignified course the Board could adopt would be to withdraw from the proceedings altogether. The theory that the dignity of a public body can be promoted by taking no steps towards the investigation of charges of gross cruelty and fraud against a school under its own supervision, and of which one of its own Chairmen of Committees is a manager, is an unusual one. It seems, indeed, to have been a little too strong, even for the majority of the Board; for, though Mr. STANLEY'S motion was carried, it was with a rider, directing the appointment of a Special Committee to report upon the charges brought against the management of the school. Fortunately, however, the action of the Board had no influence on the SECRETARY of STATE'S action. The inquiry prayed for had already been ordered, and on October 20 the School Board were informed that, after careful inquiry by an Inspector, the SECRETARY of STATE was of opinion that cause had been shown for grave complaint and dissatisfaction; that the school required thorough reorganization under a new superintendent; and that a Committee of Managers must be appointed who would undertake to visit the school regularly. It might have been thought that after the receipt of this letter, Mr. SCRUTTON, who, as one of the Managers of the St. Paul's Industrial School, is presumably responsible for everything that has gone on in it, would have saved the Board the trouble of asking him to resign the post of Chairman of the Industrial Schools Committee. A manager of a school which has been declared by the HOME SECRETARY to give cause for grave complaint and dissatisfaction is certainly not a fit person for that particular office, unless and until he can prove that the SECRETARY of STATE has been misinformed, or that he himself had been guiltless. But Mr. SCRUTTON knew his Board too well to offer to resign. He had simply to keep quiet in the confidence that his friends would rally round him. Notice had been given of a motion calling upon Mr. SCRUTTON to resign, but one member after another got up to protest against its being brought forward. The notion that a manager of an Industrial School can be expected to know anything about its management is one which is repugnant to a singular emotion which certain members of the Board are pleased to call their sense of justice. At this same meeting the Special Committee was nominated, and on the 29th of October it got to work and examined one boy. Down to this time no steps had been taken to carry out the SECRETARY of STATE'S order. On the 3rd of November, the superintendent was still in charge of the school, and Mr. SCRUTTON coolly informed his admiring colloquists that "people who know anything about industrial schools" would know that it was not possible to pick up a "governor in the streets, and that they could not possibly leave the boys without a governor while they were finding one." This, be it remembered, was said of a superintendent who, if the charges brought against the school are true, has been guilty for years together of the grossest imaginable cruelty.

The conduct of the inquiry was as unsatisfactory as might have been expected from the previous action of the Board. On Monday last the Committee met for the second time, and Mr. SCRUTTON did his best, but apparently without success, to break down the evidence of the boy who had been previously examined. At this point, however, he seems to have become convinced that it was wisest for the managers of the school to play the part of injured innocents no longer; and when the Committee met on the following day he produced a statement to the effect that, though the evidence was conflicting, he admitted that many grave irregularities had occurred without the knowledge of the managers. With this noble confession the Committee were so delighted that they determined to report to the Board "that, in view of the practical proposal made by Mr.

SCRUTTON for the reorganization of the school, they do not think it necessary in the interests of discipline to pursue the inquiry any farther." With this conclusion as regards the School Board we entirely agree. Their conduct in this matter from first to last makes them a wholly unfit body to conduct such an investigation. The next step should be taken by the Public Prosecutor and by the Education Department, and we trust that before we return to the subject one or both of these authorities will have begun to move.

#### MR. GOLDWIN SMITH ON CANADA.

SIR FRANCIS HINCKS has published in the current number of the *Contemporary Review* an answer to Mr. GOLDWIN SMITH'S article in the same periodical for September, under the title of "The Canadian Tariff." Mr. GOLDWIN SMITH himself describes Sir FRANCIS HINCKS as the most experienced of Canadian financiers, and it may be added that, as a former Prime Minister of the Dominion, and as a holder of other important political posts, he speaks with authority on colonial affairs. Sir FRANCIS HINCKS is a Canadian subject of the Crown, while it is uncertain whether his opponent regards himself as an Englishman of the mother-country or as a colonist. Mr. GOLDWIN SMITH habitually uses the first person plural in speaking of the Canadians, and, according to Sir FRANCIS HINCKS, he not long since "took the stump" in Canada in support of the Protectionist party. On the other hand, he is not unaccustomed to join in English political movements; and perhaps, if he succeeded in promoting the annexation of Canada to the United States, he would choose to remain an Englishman rather than to become an American. His defence of the protective policy of Canada, though it embodies the apologetic commonplaces which are used for another purpose by English "fair-traders," forms but an insignificant portion of Mr. GOLDWIN SMITH'S argument. The main object of the article is to prove that the natural connexion of Canada is with the United States, and to denounce and ridicule "Imperialism," by which is meant the retention by England of the outlying parts of the Empire. When the excitement of personal attack is combined with the indulgence of bitter political feeling, Mr. GOLDWIN SMITH condescends to exchange the term "Imperialist" for the vulgar and unmeaning nickname of "Jingo." It seems that Lord DUFFERIN was a "Jingo" because in his eloquent and graceful speeches he recognized and encouraged the loyal enthusiasm of the Canadian people for the Crown, instead of suggesting a transfer of their allegiance to the neighbouring Republic. For the purpose of clenching the charge of "Jingoism" Mr. GOLDWIN SMITH actually quotes at length the puffing advertisement of a local dancing-master, who undertook to teach Canadian young ladies the proper deportment to be observed at Lady DUFFERIN'S receptions. It is indeed difficult to escape from the political tendency or disposition which provokes Mr. GOLDWIN SMITH'S furious indignation. "There is," he says, "little use in appealing to a Colonial Secretary. That office acts like a mitre. Make a Low Churchman a Bishop, and he is a High Churchman in a year. Make a Liberal Colonial Secretary, and he at once becomes a Jingo, if not of the drab, at least of the scarlet, species." Less vehement politicians will perhaps be more indulgent to English Ministers who have not discovered that it is their duty to use their official powers for the dismemberment of the Empire. Lord CAERNARVON and Lord KIMBERLEY were not even careful to prohibit the Governor-General's wife from giving Canadian ladies opportunities of exhibiting their beauty and their taste. Mr. GOLDWIN SMITH'S stern protest against low dresses is a characteristic instance of the moral severity which is naturally associated with political virtue.

The main facts of the argument which Sir FRANCIS HINCKS undertakes to answer are more serious than the denunciation of Viceregal improprieties of costume. Mr. GOLDWIN SMITH contends that the tariff which was passed with his aid for the avowed purpose of Protection by a Protectionist Ministry was really introduced for the purpose of raising revenue. A much smaller income would, as he further argues, have sufficed, if an Imperialist policy had not caused a wasteful expenditure on the construction of railways for military and political objects. Sir FRANCIS HINCKS replies that

the construction of the intercolonial railways was proposed and effected by the colonists and not by the English Government. Although it is difficult to ascertain the exact meaning of a term invented to express political opinion or passion, only the Imperial Government can be accused of Imperialism. For the colonists who insist on maintaining their connexion with the Crown some other abusive nickname ought to be devised. To a certain extent Mr. GOLDWIN SMITH supplies the deficiency by stigmatising as anti-Continental measures which tend to impede the annexation of Canada to the United States. After a time the reader learns that it is wicked to be Imperialist and that it is right to be Continental. The most forcible part of Mr. GOLDWIN SMITH'S essay is his exposition of the geographical relations between the different provinces of the Dominion and the neighbouring parts of the American Union. He shows that in several instances the most direct communication between two Canadian provinces lies through the States, and that the natural and easiest access to portions of the Dominion is from American territory. There are many parts of the world in which geographical or commercial convenience would be promoted by a transfer of territory. Austria is supposed to covet Salonica, and it has been even suspected that Prince BISMARCK has designs on Holland. A German pedant once wrote a treatise to prove that England and France ought to be under one government, because either country had products of its own which would be useful to the other. All Mr. GOLDWIN SMITH'S reasons for the union of Canada with the States would be rendered idle if both countries had the good sense to abandon their protective systems. It seems hard that, like philology and ethnology, geographical science, by some mysterious necessity, always conflicts with the apparent interests of England. The tendency to cosmopolitan contempt for patriotism is at least as common as the supposed degeneracy of official Liberals into "Jingoes." It is true that Mr. GOLDWIN SMITH proposes no immediate transfer of the sovereignty of the Dominion from England to the United States; but he recommends a Customs Union which would involve the extension to Canada of the extravagant American tariff. Political annexation would not be long delayed. If unwillingness on the part of Englishmen to dissolve the colonial bond exposes them to the contumelious designation of Imperialists or Jingoes, the colonists at any rate are surely entitled to have a voice in the destination of their country. Sir FRANCIS HINCKS represents the Canadians as almost unanimously opposed to the doctrines of their able adviser. "In view of the fact that there is not a single member in either House of the Canadian Parliament who has ventured to recommend this scheme of Commercial Union, there is no cause for alarm. Mr. GOLDWIN SMITH, however, labours under the delusion that the Canadian Parliament does not represent the opinions of the Canadian people. When reminded in Canada of the fact that his opinions were not represented in Parliament, he replied that the politicians would not allow any one holding them to get a nomination." England is governed by Imperialists or Jingoes, and Canada by obstinate anti-Continentalists; but Mr. GOLDWIN SMITH will find adherents enough in the United States. When he maintains that what he calls a judicious forecast is not an encouragement to annexation, he defies experience and reason. Some of his statements seem as if they were exclusively designed to invite encroachment by irritating the vanity or cupidity of Americans, and annexation is rendered more probable by being made a subject of discussion, and by implication an open question. The Canadians can in no case escape from "Imperialism," though only English politicians are liable to be denounced as "Jingoes." Mr. BLAINE'S despatches on the Panama Canal and on the war between Chili and Peru are more aggressive and more arrogant than any documents which have been issued by English Governments. In both cases the American SECRETARY OF STATE asserts or takes for granted a right of Imperial control over both the continents of the Western hemisphere. Lord DUFFERIN'S modest claim to retain the territories which actually belong to the Crown might be thought less pugnacious and less offensive; nor, indeed, is it known that any party in the United States has thought itself aggrieved either by the speeches of Governors-General or by the encouragement given to low dresses.

#### PROGRESS OF THE LAND COMMISSION.

IT is not surprising that the unfavourable comments which have been made in England on the action of the Irish Land Sub-Commissioners should have disquieted the supporters of the Government. Attempts have been made in both the morning and evening journals which principally defend the Land Bill to justify these interim decisions. Unfortunately the apologists have not taken the trouble to be accurate. One of them speaks, in commenting on the decisions in the CRAWFURD case, of "the preliminary question whether the jurisdiction of the Court was ousted by an existing lease." There was no such preliminary question, nor did the case in any respect turn on the provisions of an existing lease. Another ventures on the statement that "the question of compensation has been fully considered in Parliament, and finally decided against compensation." Short memories are convenient things—when nobody else has a long one. So far from the subject of compensation being fully considered and finally decided, it was met by Mr. GLADSTONE with a previous question. There could be no talk of compensation, he said in effect, because there would be no damage, and, if there was proved to be damage, then there would be a case for compensation. Assurances of this kind from Mr. GLADSTONE are indeed but a Bardolphian security. They are always made, in the French legal phrase, *sous bénéfice d'inventaire*, with a proviso for repudiation if fulfilment should prove inconvenient. But the fact of such an argument having been used is at least sufficient to prove that the question of compensation was not fully considered or finally decided. These apologists, however, have been much comforted by Lord MONCK. Lord MONCK is a person whose acquaintance with Ireland, and whose relation to the Government as a moderate but trusted Liberal, as well as the responsible positions which he has held, entitle him to at least a respectful hearing. He has written to the *Times* to say that the Sub-Commissioners have been unfairly blamed; that "the CRAWFURD estate is a typical example of the class of estate which has brought a bad name on 'Irish landlordism'; that the point on which it is alleged that the Sub-Commissioners have gone beyond the intentions of Parliament, as well as the requirements of justice, was 'raised and discussed and decided in the negative'; that other landowners need not fear, and so forth. It is not surprising that this letter should have called forth damaging replies from Lord GEORGE HAMILTON and others. As the importance of the case can hardly be exaggerated, as it is evident that some at least of its English critics have not troubled themselves to look at the facts, and as Lord MONCK'S opinions are sure to be quoted, and have been quoted without examination of their grounds, it is well to give them that examination.

As Lord GEORGE HAMILTON remarked, and as has been remarked before, no one not on the spot can judge whether any actual reduction of rents is fair or not; but every one can judge whether the principles on which it is announced that reductions are made are fair or not. Lord MONCK may be right in his idea of the CRAWFURD estate as a rack-rented and "screwed up" one. It is sufficient to say that no evidence was produced of this, nor was the decision based on any such allegation, nor is it borne out even by the elaborate special pleading of an article in the *Times* of yesterday. Nor was there, as the writer in the *Daily News* infers, any allegation of an existing lease ousting the jurisdiction of the Court. The facts, which, it seems, must be repeated, are that the farms were let forty years ago on a twenty-one years' lease, with a clause stating that all improvements made were at the expiration of the lease to be the property of the landlord. Every tenant, therefore, who spent a penny of money or an hour of not immediately reproductive labour on his holding knew that he would have as compensation twenty-one years' enjoyment (or what less time remained on his lease), and no more. It is not alleged that the rents were then high. Indeed, though some persons contend that the rents of forty years ago are the fairest criterion of what they ought to be to-day in Ireland, the Commissioners have actually fixed the fair rent at some ten per cent. above the leasehold rent of that year. Nor is it alleged that any tenant was solicited to improve his holding, or that the landlord infringed in any way the covenants of the lease. The consequence was that, when the leases fell in, the improvements, if any, became the

landlord's property as fairly and justly as if he had paid for them with a cheque on his bankers. They were made under an express agreement; the tenants had been free not to make them if they thought the allotted term of enjoyment insufficient, and they had had that term. They had more; for it was not till three years after the expiry of the leases that a revaluation was made. That is to say, Archdeacon CRAWFORD bought his tenants' improvements by giving them twenty-four years' enjoyment of them (or less in proportion) when his covenant bound him only to give them twenty-one. Further, the ground of the reduction is not that the revaluation was excessive, but that the element of increase was in the Sub-Commissioners' opinion not proved, despite the express and fulfilled contract just mentioned, to be the property of the landlord. This is the real point of importance, and it would remain of importance even if it were proved that the CRAWFORD rents were actually too high for the value of the land. Lord MONCK thinks that the view adverse to the Commissioners' construction was "raised, discussed, and decided in the "negative" in Parliament. Familiarity, painfully gained, with that interminable discussion will enable any man who has gained it to meet this statement with a direct contradiction. That the Act might operate in some such way was indeed suggested by adverse critics; but the suggestion, in whatever form it was made, was always met by strenuous denials on the part of the Government. As for the particular case, no such operation of the Act was even hinted to Parliament as intended by its promoters, and it is safe to say that not a hundred members, exclusive of the Land League representatives, could have been got to vote for it.

The alarm—it would perhaps be safer to say the indignation—which has been aroused by the initial proceedings of the Sub-Commissioners is, however, by no means confined to this particular decision. The principles on which some of these gentlemen seem to go, and which certainly account sufficiently for the results at which they arrive, are of so extraordinary a nature that it is at first sight difficult to believe that they are seriously enunciated, still more that they are seriously acted on. Professor BALDWIN's dictum, that the Commission has nothing to do with the capabilities of the land in other hands than those of the actual tenant, is sufficiently surprising. It may be a logical deduction from the partnership theory, though even that would be somewhat hard to make out; but how it can be consistent with the injunction of the Act to consider the interests of landlord and tenant respectively it is impossible to see. It is perhaps useless to insist on its extraordinary injustice to the landlord in defining the value of his contribution to be simply the minimum that a lazy, an unskilful, or an ill-conditioned partner chooses to get out of it. Justice to the landlord is said, with some truth, if also with some effrontery, to be an obsolete plea. But it may perhaps be pointed out that nothing can be less for the interest of the tenant himself, or of the country generally, than that in a land of thriftless, wasteful, unscientific cultivation, a premium should be put on cultivation that is thriftless and unscientific. On Professor BALDWIN's carefully formulated axiom, the tenants of the future have only deliberately to waste the land towards the end of each fifteen-year period to ensure a reduction of rent. But even this dictum has not on the present occasion carried off the prize of anti-landlordist paradox and fallacy. Before one or other of the former Commissions an ingenuous witness is said to have expressed his opinion that a fair rent for a bachelor was not a fair rent for a man with a family. The answer was at the time laughed at as an amusingly hyperbolic expression of the tenant-right theory, a characteristic sally of audacious Irish humour. It now appears that it was nothing of the kind. On Saturday last at Newtownards Mr. SOMERSET WARD, a land agent, was gravely asked "whether he had calculated what margin would be necessary to enable a farmer of such and such a class, *"with an average family, to live in decency and comfort."* Strange to say, Mr. WARD "admitted" that he had never made any such calculation, and this admission is spoken of by a businesslike and impartial reporter as evidence of the carelessness with which the landlords' cases are got up. This is not a thing devised by the enemy—a *canard* of the Property Defence Association. It is vouched for by the Irish Correspondent of the principal London daily paper which supports the Government and the Land Act. In other words, the golden age to which KINGSLEY's

labourer looked back has returned for the small Irish tenant. "So soon as a man got a fresh child, he went and got another loaf allowed him next Vestry like a "Christian." The Irish tenant has a more ample recognition of his Christianity, for he goes to the Land Court under the same circumstances and gets a reduction of rent. The thing is of course incredible; it may very nearly be called impossible; but it nevertheless seems to be true, and a few minutes' thought shows that it is simply an expansion of Professor BALDWIN's general principle, and not much more than a reduction to particulars of the "live and thrive" principle of Mr. Justice O'HAGAN. There are, indeed, glimmerings of better sense in some of the Sub-Commissioners, as may be seen in the interruption of Mr. Sub-Commissioner KANE, when a tenant was taking the stereotyped oath that he could not live on his holding, to the effect that no one could expect to live on a holding of five acres—a remark which cuts at once at the root of the Land Act and of the decisions of the speaker's colleagues. But the general spirit appears to be to make the Act simply what it was predicted that it would be—a knife to cut annuities for the tenants out of the landlords' rent-roll—and to support this proceeding by solemnly formulated "principles" which read like a deliberate barlesque on common sense and justice.

#### THE BALCOMBE MURDER.

THE interest which was shown from the first in the crime which has now been finally decided to have been committed by PERCY LEFROY MAPLETON was perhaps less purely morbid than is usual in cases of murder. Against the fact that few murders, or attempts to murder, in railway-carriages have passed unpunished is to be set the apparent facility with which such attempts can be made, and the constant exposure of most people to them. In many cases there is hardly a day, and in most there is hardly a week, in which the average Englishman of the upper or middle class does not travel for a greater or less distance in a compartment of a railway carriage, with the chance of having a single companion totally unknown to him. The application of the parallel is therefore almost painfully easy. The length of time, moreover, during which the quest for LEFROY continued added to the excitement of the affair, and though, regarded either as a dramatic crime or as an interesting problem of evidence and law, the case could not be compared for a moment to the Penge and Balham affairs of a few years ago, it had perhaps an even stronger attraction for the great vulgar, and the small. There ought not to be any thought of comedy in connexion with a matter which has already involved one death, and must now involve another. But in some comments on the case it has been not very clear whether the critics were most gratified at the prospect of the sword of justice descending on a criminal, or at the certainty of the deterrent effect which would be exerted on possible railway murderers by the hanging of somebody, no matter whom. The confusion of thought is perhaps natural, if it is not very creditable, to the reasoning powers of those who labour under it.

Contrary to custom as recently established, the trial occupied no more than a reasonable time, and indeed the amount of relevant evidence procurable, or indeed of evidence relevant or irrelevant, was so small that it could hardly have been spun out. The old and tiresome dispute as to what is and what is not circumstantial evidence has of course been renewed, with the old failure to come to any satisfactory conclusion. The really satisfactory division of criminal cases is into cases where it can be shown to be impossible that any one but the prisoner committed the crime, and cases where it can only be shown to be in a more or less high degree improbable. The former class is of necessity almost entirely confined to those cases in which the act is committed in the actual presence of witnesses, and there are some persons who seem to think that the last punishment of the law ought not to be inflicted in any other. The case of LEFROY, no doubt, was not one of this kind. The evidence was, by the widest possible admission of hypothesis, just compatible with his not having committed the crime, and it was to the proving of this that Mr. MONTAGU WILLIAMS, with remarkable ability, directed his efforts. It was not possible to make more of the discrepancy about the hats, the disappearance of the weapons with which the crime

was certainly committed, the doubt about the pawning of the revolver, the conflicting evidence of the persons who received LEFROY when he got out of the train, the strange episode of Mr. WESTON, the Brighton Town Councillor, and all the other slight handles which the case afforded, than was made by Mr. MONTAGU WILLIAMS. He succeeded in making out such a case that an exceedingly paradoxical jurymen might have chosen to concentrate his attention upon it to the exclusion of the other and more reasonable view. That view is, of course, that the "third person," though not absolutely impossible, is so nearly impossible that he must be left out of the question. When the third person is left out of the question LEFROY's case becomes absolutely hopeless. And, indeed, his own story at Brighton admits as much. He was certainly in the carriage with Mr. GOLD at Croydon; Mr. GOLD was certainly not in the carriage with him at Preston. He was injured exactly as he would most probably have been injured, on the theory of his guilt. He had the dead man's property on him, and his own property was found scattered about the carriage. He almost certainly had such a revolver as would have been used in the struggle. He certainly absconded in a most suspicious manner, and he failed to give any satisfactory account of his presence in the carriage at all. Therefore, when all the facts of the case are taken together, it is seen that the evidence against him is an unusually remarkable instance of a kind of evidence the name of which is as often abused as the name circumstantial. It would be impossible to present a much more formidable heap of cumulative testimony than that which the ATTORNEY-GENERAL was able to pile up. The Hanoverian medals, the revolver pawning and redeeming, the condition of LEFROY at Brighton, the evidence of the women at Horley, the lame stories as to the Brighton journey, the watch and its place of hiding, were none of them, taken separately, inconsistent with a certain possibility of innocence; but that possibility became smaller and smaller as each was added to the others. When the whole was added together, there remained no possibility left except that infinitesimal possibility of the "third person" upon which Mr. MONTAGU WILLIAMS had to rely, and perhaps the difficulty of accepting the strange initial circumstances of the deed. It is in the highest degree improbable that Mr. GOLD's circumstances or person were known to LEFROY, and therefore the latter must be supposed to have started with his revolver on a general raid against humanity, choosing for the purpose one of the shortest trunk lines of railway which lead from London, and one of the most crowded. This would be *prima facie* improbable, just as the third person is *prima facie* possible. The jury, however, had to set these hypothetical considerations against the formidable mass of positive evidence on the other side. They found them wanting, and there can be no reasonable doubt that they were right so to find them, unless we are to lay down the rule that, so long as a murderer has the prudence to avoid actually committing his crime before witnesses, he must escape the gallows.

Lord COLERIDGE was, if anything, too lenient in his comments on the astounding conduct of the railway officials, and the still more astounding conduct of the Brighton police—matters which are by far the most important to the public safety of all those involved in the case. It has been hinted that the view of the trial which limits itself to the consideration of danger to railway travellers if LEFROY be not hanged is somewhat narrow. The view which omits the consideration of the extreme danger to railway travellers if anybody concerned in the extraordinary *laches* of the 27th of June escapes without the severest reprimand, and perhaps something more, is certainly not wide enough. Nothing has occurred, nor has one tittle of evidence been brought forward, to weaken what was said at the time of the transaction. It is perfectly clear that, if LEFROY had been luckier in his victim; if he had found, as he easily might have found, a considerable sum of ready money in Mr. GOLD's pockets; he would have had no difficulty in getting clear off. But, whether he would have had such difficulty, or whether he would not, does not affect the conduct of the officials. The utter imbecility of all concerned is such that, if a novelist had introduced it in his book, his critics would most assuredly have taken him to task for conceiving such improbable folly. It may be said that much is not expected of the police, but railway officials at least are supposed to have their wits about them. If LEFROY had

travelled with a wrong ticket, or had got into a wrong class of carriage, or had had two pounds of luggage more than the proper weight, those wits would, no doubt, have been exerted sharply enough. But the possession of a ticket *en règle* seems to quiet all the suspicions of a railway official. A carriage drenched with blood; a man obviously fresh from a desperate struggle, with watches in his boots, and flash coin in his pocket; a cock-and-ball story, which, even if it had been true, required instant action to be taken and a strict watch to be kept of the teller—none of these things, nor all of them together, had any effect upon the hearers. After this, even the detectives—one of whom good-naturedly suggests that the murderer should "go home to his friends," while the other admits "I knew that a body had been found in a tunnel" "without a watch, and that this man had a watch, of which" "he had given the wrong number, and yet I let him go"—are quite congenious and comprehensible. The case is, perhaps, a striking example of the brutal savagery of the human heart; it is certainly a striking example of the more than brutal folly of the human head.

#### CHEAP AND DEAR BOOKS.

UNPOPULAR authors—that is, all authors except a very few—are so situated that they would welcome almost any change in the methods of the publishing trade. They are therefore likely to catch eagerly at the prospect of securing a wider public and a little money which is offered in a rather sensible article in the *Times*. At present, as the *Times* observes, "the ordinary case of an author who writes a good and moderately successful book—leaving novels, for the moment, out of the reckoning—is that, after a thousand copies have been sold at half a guinea he finds himself with twenty or fifty pounds as his share of the profits." He may consider himself unusually lucky if his gains reach anything like the latter sum, if he has published on the system of receiving "half-profits." Now these results are not satisfactory to the author, and as the publisher has of course only received another sum of twenty pounds or so as his half of the profits, the publisher, too, has no reason to rejoice. Meanwhile "the great Public," as Mr. Goldwin Smith calls it, is also deserving of sympathy. It is not every one who can pay from ten to eighteen shillings for a work which we will suppose, for the sake of argument, to be not without solid merit. Now let us see how matters would have been ordered in France. The author's book would have been brought out at a published cost of three francs and a half, if in one, and of seven francs if in two volumes, instead of at a published cost of from ten shillings to a pound, as in England. The probable results would be that at least three French people would buy the French book for every one who bought the English book. According to the usual French arrangement the author would receive a royalty, say half a franc; on each copy of his work which was sold. If he only sold a thousand copies he would clear 20%, which, we venture to think, is at least as much as he would gain on a thousand copies of an expensive English work. But, if he sold three thousand—which may be reckoned as probable—he would receive 60%, while his work would lie on the shelves of thrice as many purchasers as he could hope for in England. Whatever may be thought of these calculations, it is a fact that French publishers find their profit in selling a solid historical work of between six and seven hundred pages for five francs. In England the book is translated, is published in two tall and portly volumes, is illustrated with second-hand woodcuts, and is offered to the world at the price of twenty-five shillings. It seems to be reasonable to expect a far wider popularity for a book published on the French system.

So far we have been examining the case of books which in England cost from ten shillings to a pound, and in France from three and a half to seven francs. Neither price would be considered cheap in America, where publishers can have English books for the stealing, and can bring out Mr. Arnold's poems, for example, in a form much resembling that of the *Saturday Review*, at a cost of about fivepence. An experiment in the production of English books at a similar price, and in similar pamphlet shape, has lately been made, and about this cheapest form of literature we have some remarks to offer. But, in the first place, we must examine the possibility of introducing the French system into England. It was started in France, we believe, by M. Michel Lévy. Observing that books were dear and readers comparatively few, he determined to offer the public his new works at three francs a volume, and his more established and familiar novels at a franc the volume. Neither M. Lévy nor the "eminent hands" who wrote for him had any cause to repent this arrangement, while the public showed its satisfaction by purchasing millions of books. We seldom see a French novel of the pre-Lévy epoch, but occasionally a copy of some book of the "Romantic" period comes into the market as a bibliographical curiosity. These novels of 1830 and later are tall and stout, and were originally expensive, though their present price is a purely fancy one. They were three or four times as dear, not really better printed, and not a quarter as handy as the ordinary French novel which we owe to

the enterprise of Michel Lévy. How would a similar change in the direction of cheapness and convenient size work in England? A novel of Mr. William Black, or of Mr. Hardy, or Mr. Payn is published in three volumes at a nominal price of thirty-one shillings and sixpence. Only the circulating libraries buy it in this shape. Later it comes out in a single volume, costing twice as much as *Numa Roumestan* or *Le Comte Kostia*. Very few people, comparatively speaking, buy novels in this form. Last comes a cheap volume, with a flaring picture on the cover, which is freely bought at the railway stalls for two shillings. Now let us imagine that *The Princess of Thule* or *The Duke's Children* were originally brought out, in a handy shape, for three shillings. Probably many thousands would at once be purchased by the public. But it is impossible to say that the arrangement would work as well as it does in France. The circulating library has become one of our institutions. As a consequence—and it is a melancholy one—we have ceased to buy books. Our London houses, especially, have scanty room for libraries. Our habits of living like respectable gipsies, and of moving perpetually from one house to another, interfere with the taste for collecting books, which are “holy, but heavy to carry,” as Mr. Swinburne says of *Freedom*. Thus the circulating library has become a part of our manners; we no longer buy books, we borrow them; and, in consequence, we rather skim them than read them. For ephemeral wants a slight ephemeral literature is supplied; and our novels are by no means such studied and permanent works of literary art as the better novels of France. All this is very much to be regretted. It seems almost certain that we owe the eternal stream of hopelessly feeble novels, and of frothy tedious books of travel, to the circulating library. No one in his senses would buy such books; but the clerk at the library packs them up in the parcels of subscribers, and they are languidly skimmed by people who find them on their tables. By these devices, the publishers of trash in three volumes are able probably to make some profit out of it. But if the French system prevailed among us, authors whose books no one bought would perhaps cease to plague the world with their weak inventions, and their trash would not constantly be brought to our houses by the mechanism of the circulating library. Thus everything seems on the side of the French system, except our confirmed habit, and the invincibly conservative custom of the trade. We have lost the habit of buying books; we have acquired the habits of borrowing and skimming. Again, the French system is not so cheap as it seems. French books must be bound, if they are not to fall to pieces, and this causes trouble, and at least doubles the price of each volume. On the whole, we fear that the bad and stupid system of the circulating library is likely to prevail in England; that books will remain dear and unread; and that the majority of even fairly successful authors will find that their writings bring in only infinitesimal profits.

The American system of producing books in a kind of pamphlet or newspaper shape, at a very low price, is easy enough, of course, in America, where the copyright of English books costs the publisher nothing at all, and where there is an enormous reading public, careless of the delicacies of good type and thick paper. The plan has been imitated in England by people who can afford to make the experiment—the publishers of Lady Brassey's *Voyage of the Sunbeam* and of Sir Theodore Martin's *Life of the Prince Consort*. Both books are so extremely popular, and the latter has been so far out of the reach of poor but loyal and curious students, that the experiment is sure to succeed. According to the *Times*, “it is said that over a hundred thousand *Sunbeams* have already been sold,” and this is not surprising. As to the *Life of the Prince Consort*, “the public will be able to buy for half-a-crown what has hitherto cost them four pounds.” Both books will reach that “immense” public which knows not Mr. Tennyson or Thackeray, and which has lived on Mr. Spurgeon's *John Ploughman* for Sundays and the *Family Herald* for week-day reading. But, however much we may wish it were otherwise, it is certain that only a few books of the better class would be bought at a sixpenny price by the “immense” public. What they want is absolute simplicity of style, and matter which, as the slang goes, is “palpitating with actuality.” How few books answer to this description! Perhaps it would be a salutary thing for authors to have to appeal to a public that only cares for facts stated in a manner absolutely transparent. But so little is understood of this great unknown public that, not impossible, they might admire Mr. Tennyson and revel in Mr. Browning's less unintelligible writings. We have seen it stated that Mr. Browning's complete works cost six pounds. Now poetry is not a ware that can be procured from the circulating library. To know a poet we must keep his volumes always close at hand, and read them in many moods. It is not all lovers of poetry that can afford to invest in six pounds' worth of Mr. Browning. Probably the Americans, *felices nimium*, can buy his complete writings for a little less than a dollar. But the cheap American pirates certainly do not steal all the works, for example, of Mr. Swinburne. Probably they wisely reckon that the fivepenny public does not care for *Bothwell*. Were it possible to believe that, if our publishers published cheap books, the Americans would consent to a copyright treaty, the experiment might be ventured on. The enormous and incalculable increase of the market would make cheap books possible. But we sincerely trust that the sixpenny form of publication, which degrades a book into a frowsy dog-eared newspaper, will never prevail in England. That form of publication makes people careless of books which we should cherish as the dearest of possessions

and the kindest and most changeless of friends. A man will throw away a sixpenny Milton or Scott as he throws away an old newspaper. It can never become an inmate and an ornament of his house, as a book ought to be. It will of necessity become thumbed and dirty; pages will fall out, and the pamphlet will in a few weeks be unsightly and worthless, fit for the waste-paper basket, not for the bookshelf. One result will be the rapid, reckless reading which already exists as a consequence of the system of the circulating library. Mr. Ruskin has always defended the high price of his own books, on the ground that people should be ready to make sacrifices for what is truly valuable. The material workmanship of our books should command respect. This is not, we believe, inconsistent with comparative cheapness. Some French editions of French classics, published at a franc a volume, are really exquisite books in their way. But the material aspect of a sixpenny pamphlet book is merely hideous, and soon becomes slatternly. It is, therefore, not disagreeable to reflect that few English books are so popular as to be likely to appear in newspaper form.

#### THE ROSIERE OF RATCLIFF HIGHWAY.

THE encouragement of virtue would seem, to the superficial observer, peculiarly appropriate in the neighbourhood of St. George's Street, formerly known in the *Newgate Calendar* and elsewhere as Ratcliff Highway. It is true that the place has acquired, from various causes, a certain reputation of the kind called, by sarcastic people, undesirable. Some eighty years ago, for instance, a most artistic murderer, in the wholesale line, practised here; he has been immortalized by De Quincey, and his memory still survives among the natives, who probably do not read that writer. One murderer, however, is hardly able alone to confer a stamp upon a whole parish. It is also true that there are docks, and dock labourers, and sailors, and drinking-shops, in St. George's, and ladies who stand in the open all day with knitting-needles in their hands and shawls upon their heads; and it is also true that the place is grimy and the houses mean. It may further be charged against this street that Jaurach's is in it; for, if Bob the Grinder found pigeons demoralizing, what must be the influence of the pump? In point of fact, the district, if not entirely opposed to the cause of virtue, is ostentatiously ill-favoured; it parades its dirt; yet it is said, by those who know it best, not to be so bad as it has painted itself. One would very rarely rather live in St. George's Street than in Drury Lane; some parts of Soho are a great deal more dangerous; and there is a certain collection of streets at the end of the Commercial Road, opposite the Foreign Sailors' Home, compared with which St. George's Street is clean and Cable Street respectable. Therefore, while we congratulate St. George's on the possession of a stimulus to virtue peculiar to itself, we refrain from the exhibition of supercilious superiority as regards the virtue of our own parish; we may even envy the parishioners an endowment which yearly transforms a virtuous maid into a *Rosière*, a prize young woman, a damsel whose successful resistance to all temptations, together with luck in the lottery, has handed her over to her lover, not only charming in herself and adorned with the graces of proved virtue, but possessed as well of that unusual thing among English brides, a *dol*.

The existence of the singular institution to which we are calling attention is as good as unknown outside the parish. Like many other London customs and endowments, it can be found duly noted in works on the great city, and has been, we believe, described quite recently by the present Rector of the parish in his book on the East End. Yet, on the occasion of the latest function in connexion with it, that of November the 5th last, the present writer seemed the only outsider who came to see the ceremony; nor did it appear, from information received, that strangers ever do attend, or that the world of reporters and descriptive-article writers are at all aware of what a curious and interesting ceremony may be witnessed twice every year among the slums north of the London Docks.

Early in the last century there flourished on the north bank of the Thames, among the sailors of Wapping, Shadwell, and Poplar, a brewer named Henry Raine. It was a time when the foundation of almshouses was more common than that of schools, as may be proved by an afternoon's walk down Whitechapel, Mile End Road, or any of the northern or north-eastern roads out of London. Mr. Henry Raine, probably thinking it of greater importance to train up the young in the way they should go than to provide shelter for those of the old who have unhappily gone the other way, founded a school for boys and girls, fifty of each, with salaries for master and mistress. This done and the school well started, he presently built and endowed an asylum for girls, to be taken out of the school, trained for four years in the duties of domestic service, and then put out into good places. The girls were not necessarily to be orphans, but they were to remain under some sort of *surveillance* for four years after leaving the asylum. If during that time they kept their good character, and found a lover also of good character, who must be a native of St. George's or an adjoining parish, and a Churchman, they might, at the age of twenty-two, draw lots with other girls who fulfilled the same conditions for a marriage portion of one hundred pounds. If the number of forty girls of the asylum is kept up, there might therefore be as many

as ten candidates for this lottery every year; but it is obvious that early marriage, departure from the parish, impatience of four years' waiting, or engagement with a man not belonging to the stipulated parishes, and perhaps even the loss of character, are all accidents tending to lower the number; and, in fact, when the drawing of lots took place last May, there were, we believe, but two candidates, the unsuccessful one of whom received last Saturday, without any competition, the prize which she had lost in May. The drawing of lots, the marriage ceremony, and the ceremony of presentation, are all regulated by custom and order supposed to have been arranged by Raine himself.

The church itself rises, an immense mass of stone, among a network of lanes and streets of a meanness only to be equalled by parts of Marylebone and Soho. The church doors open upon a broad stone terrace or raised platform approached by stone steps, a feature which gives it a certain dignity. Behind it, cut out of the once great churchyard filled with the graves of the forgotten dead, they have made a green space with winding paths, flower beds and seats, the one bright and pleasant spot in this squalid parish. In warm and sunny weather the seats are always occupied and the walks crowded. It is the Park of St. George's Street and Cable Street, what it is now the pretty anatomical custom to call a Lung. Surely it is better to convert the old churchyards into such open spaces, sacred to fresh air and flowers, than to leave them—as, for instance, the vast area round Stepney Church is left—a dreary, uncared-for waste of headstones, the names on which could not be more forgotten than they are, even were all the slabs to be carted away and converted into lime. To-day the garden is empty, although the sunshine lies on the withered flowers, for the women, old and young, who chiefly use the place are gathered about the railings outside the church or are standing upon the terrace waiting the arrival of the bride, though it is half an hour before the time. It is not, they tell each other, the grand day of the year; the parish will not be paraded by the schools; there will be no dinner in the evening; but the essentials—the hundred-pound prize and the Virtuous Maiden—these are things which belong to both days. Presently arrive the girls of the Asylum with their matron. They are clad in white and blue, with high, starched caps of white, also trimmed with blue ribbons, a dress more becoming than that of some unlucky girls in charity schools, yet designed and invented, one doubts not, by the masculine mind. No woman would ever have invented such a dress for girls. They take up their place at the south side of the choir. Their faces, which are rosy, bright, and show good feeding and kind treatment, express the liveliest satisfaction with the proceedings; it is, they feel, in their honour that this function is celebrated; it is one of themselves who is the central figure of this procession; for them is the church crammed with the women of the parish; for them the Treasurer and the Governors are ready with their wands of office; in their honour the Raine's boys, whose virtue must be its own reward because there is no hundred-pound prize for them, are sent to the church, and stand opposite to them in the choir; not a girl but feels on this joyful occasion that she herself may one day be the heroine of this triumphal morn. When the bride is led up the aisle and deposited beside the happy groom, there is a great gasp of sympathy from the girls and another, apparently of envy, from the women who crowd the church. In the faces of those who look down upon her from the galleries, the happy *Rosière* may read the question why they, no doubt equally virtuous, are not equally favoured. It is a question which humanity is always asking, but as yet without receiving any answer. Then the bells, which have been clanging and clashing to welcome another victory of virtue, are silent, and the service is commenced.

When the morning prayers are finished and the wedding service begins, we sing a hymn while the Treasurer and Governors, clinging to their wands, gather round the bridal party at the altar. They mean well, and one cannot on these occasions have too much ceremony; but it looks somehow as if they were resolved not to let the bride run away. Can there have been, before the days of Raine, a survival, even in St. George's, of the old bridal custom of flight and pursuit? And did the respectable Raine set his face against that custom? The bride, who is naturally conscious of the grandeur of a position which she must have ardently desired for eight years at least, bears herself with commendable modesty, while the bridegroom, a stout-built young fellow of her own age, shows in his glowing cheeks and downcast eyes a true spirit of humility. But on such an occasion, who cares about the bridegroom? And when the Rector concludes the service with a brief and sensible little sermon on the duties of the married state, we all feel that the bride knows them already, and turn our eyes upon the bridegroom, for whom alone the admonition must be meant, in the hope that he is heedfully attending. Then the service is over, and we sing old Luther's Hymn of Praise, and the organ peals out the Wedding March, and the married pair step proudly down the aisle, with tears of mingled triumph, modesty, and shame in their eyes, and the Asylum girls with many smiles walk after them between a line of all the boys and girls on Raine's Foundation. Outside, the bells begin again, and there is a roar of voices, and the greeting of the multitude.

The conclusion of the ceremony takes place in the Vestry Hall. It has a fine aroma of the eighteenth century about it, and the Trustees should, for the occasion, assume buckles, stockings, and a Ramillies wig, or "a fine flowing Adonis." We are gathered in the largest chamber; seats are ranged so as to form a hollow square; the boys stand all round the room; at the lower end is a

harmonium, behind which are the Asylum girls; at the upper end is a table with a chair for the President, who is the Rector. When everybody is in his place, we begin by singing an Ode in honour of Henry Raine. It is a fine piece of work, perhaps the production of some Lord Mayor's Laureate, with a chorus—

Proclaim his worth, fulfil the plan  
Of this unrivalled friend of man;

and set to music, the composer of which, like the poet, remains unknown. Yet it is a fine, rambling air, running cheerfully up and down the scale, from the lowest to the highest notes of the girls, who sing, an air unrestrained by the ordinary trammels, as befits music set for the impassioned Ode:—

And when long years have come and gone,  
Still shall the work of good go on;  
And many a nymph and many a swain  
Shall bless with joy the name of Raine.

This done, the bride and bridegroom advance towards the Chairman, who addresses them in a few words of congratulation and admonition, all eyes being again turned towards the bridegroom, because of course he is the one who most wants both to be admonished and congratulated. It is needless to say that the present Rector of St. George's acquits himself of the task with the utmost good sense, taste, and feeling; and then the bride receives the *dot*—a hundred golden sovereigns in a long purse of the good old-fashioned kind dear to pickpockets, fifty sovereigns at either end. The married couple again retire while we sing a second Ode, after which the Chairman and Governors shake hands with the newly-married pair, and we all retire, the natives of Cable Street, whose faces are much more grimy than human faces in any other part of the habitable globe, being gathered in a circle round the door, under the protection of two policemen. Taken in fifties, these grimy faces produce a terrifying effect, and one is glad to see the policemen. But the people do not really desire to rend and tear us, though a visitor for the first time may think so. They are only curious to gaze upon a young woman whose merits and whose fortune have proved so great as to start her in life with a hundred pounds—a whole hundred pounds.

These marriages generally, it is said, turn out well. To be sure, when a girl has gone through eight years' training and supervision; when during all that time she has had dangled before her eyes this long purse with the glittering sovereigns, she must have thoroughly realized the solid value of virtue, and she must have perceived, in addition, the importance of not "keeping company" with any toss-pot who may offer. The *Rosière* may in after years give herself airs over her own extraordinary goodness and the great fortune it enabled her to bring her husband; the good man would probably endure these in patience; and the virtue will remain when the money is all gone. For even a hundred pounds will not last for ever; it is only good for a start, to supply the funds for one bold venture, or for furnishing, or for putting in a napkin and hiding away. As regards the bridegroom of last Saturday, he is a carman by trade, and it was whispered that with his hundred pounds he will attempt something superior in the Fish line. May he increase and multiply, if only for the further glorification of good old Raine—the "unrivalled friend of man."

#### ARCHBISHOP MACHALE.

THE "Lion of the Tribe of Judah," who could boast with Nestor of having lived through three generations of men, and who almost seemed gifted with an immortal youth, has passed away at last. John MacHale, Roman Catholic Archbishop of Tuam, died on Monday last in his ninety-first year. To many of the present generation his name may hardly be familiar, but there was a time when it was as much a household word in Ireland, and as great a terror to evil-doers—that is to English Ministers, on whom he would have bestowed no milder designation—as that of his friend and ally Daniel O'Connell, or in later days of Mr. Parnell. Not that it would be at all fair to compare the sturdy, pugnacious, outspoken old patriot who has just gone from us with the interesting denizens of Kilmainham Gaol, or even with his archiepiscopal brother of Unashel who has so tardily recognized the binding force of the eighth commandment on his countrymen. John of Tuam was in former days generally violent, often wrong-headed, and sometimes positively mischievous, but he was always transparently honest. If he loved Ireland "not wisely but too well," even the heartless Saxon never dreamt of doubting that his love was genuine; he did not make Ireland a stalking-horse for personal greed or ambition, and it is only fair to admit, what is implied in subsequent legislation, that many of the grievances he denounced so sharply were real and serious ones. Something too must be allowed for the force of early association in a man whose memory went back to the age of the penal laws and who could only get his schooling by stealth from teachers of his own faith. Those were days when, as Sydney Smith characteristically expressed it, "the man who hinted at the abominable tyranny and persecution exercised upon Catholic Ireland was shunned as unfit for the relations of social life." Johnny MacHale, the future archbishop, and fifth son of a small farmer in the county of Mayo, picked up the first rudiments of learning under a hedge from the contraband but tolerated instructions of the Roman Catholic village schoolmaster. This was all the teaching he got till he was thirteen, and he used to tell in after days how he remembered a priest being hanged at Castlebar for giving

refreshment to two French officers who passed his door. Such reminiscences were not likely to foster any very lively affection for the English Government in a high-spirited boy of more than average capabilities and devoted alike to his country and his Church. Being an aspirant to the priesthood young MacHale was sent to Maynooth at sixteen, and at the unusually early age of twenty-three was not only ordained priest but made deputy professor of Dogmatic Theology, succeeding five years later, on the death of Professor Hogue, to his vacant chair. But, though he discharged this office with credit for eleven years, it was not as a theologian or a scholar that he was destined to be chiefly known. His Maynooth lectures, however able, did not attract so much attention as the vigorous letters in vindication of the doctrine and discipline of his Church which during the same period were constantly appearing in an Irish newspaper under the signature of "Hierophilus," and which were known to come from his pen. It was perhaps to the celebrity thus obtained that he owed his elevation to the episcopate at the age of thirty-four, being consecrated in 1825 Coadjutor Bishop of Killala, *cum jure successionis*; and he attained only nine years later, when he was himself but forty-three, the highest rank in the hierarchy as Archbishop of Tuam.

Dr. MacHale, like so many of the Irish priesthood, was from the first quite as much of a politician as an ecclesiastic, and he was not the kind of man to allow his personality to be extinguished by a mitre. On the contrary his pen, never suffered to lie idle, was now more than ever at the service of O'Connell and the Catholic Association. When in 1831 he paid the prescribed visit *ad limina Apostolorum*—a provision admirably adapted for keeping the episcopate well under the thumb of the Curia—he utilized this period of comparative leisure for the composition of a series of descriptive letters on sights and scenes in the foreign countries he had to traverse. But on his return he lost no time in proving that his hand had not lost its cunning by addressing to Lord Grey three letters, the first denouncing his Coercion Bill, the second assailing the Established Church, the third in support of the incipient agitation for Repeal. This was before his elevation to the archbishopric in 1834. But for ten years afterwards an almost unbroken series of missives appeared on all sorts of Irish questions—Maynooth, public education, Poor Laws, tenant-right, "Godless Colleges," Tithes Bill, and the like—authenticated by the well-known signature of "John, Archbishop of Tuam." There were few men better loved in Ireland generally, or better hated in the English "Pale." His last conspicuous appearance in what may be called the capacity of an agitator was at a monster meeting held in the Rotunda at Dublin in 1850 to protest against Lord John Russell's abortive Ecclesiastical Titles Bill, and he is said to have been the first prelate publicly to violate the Act, when passed, by an ostentatious use of the forbidden title in a letter dated from St. Jarlath's. But it was not only or chiefly advancing age which reduced the last thirty years of the Archbishop's long and active life to comparative obscurity. Great as had been his services to the Church in various ways, they had not been wrought in exactly the way that Rome most warmly appreciates, and when in 1850 the gentle and gracious Archbishop Murray, titular Primate, was called to his rest, it was resolved to thrust on the recalcitrant clergy and prulacy of Ireland—who had sent up three very different names to Rome for the vacant dignity—a superior who should forcibly wrest from Dr. MacHale the virtual leadership of the Irish Roman Catholic Church which he had for many years enjoyed. No two men could well be more utterly unlike in their tastes, feelings, and antecedents, than Cardinal Cullen—trained at Rome in all the wisdom of the strictest sect of curialists—an Irishman, if you please, but first a Catholic—and the sturdy old nationalist of St. Jarlath's. Dr. MacHale had translated part of the *Iliad* and Thomas Moore's *Melodies* into Irish; Dr. Cullen had probably never read a word of either work. For purely Irish questions and interests, as such, Dr. Cullen cared little or nothing; for thoroughly Romanizing the Irish hierarchy and priesthood—who hated Protestantism more than they loved the Pope, and hated it chiefly as the creed of English horoties—he cared very much, and therefore he was sent to Dublin. He was a pious, honest, narrow-minded, obstinate, illiterate man, with strong views, and not devoid of a certain kind of astuteness, and he had the whole weight of Rome, under the despotic rule of Pius IX., at his back. Moreover, he was perfectly willing to cultivate friendly relations with the English Government in the interests of the Church. Of course he gained his end. The waning star of John of Tuam paled before the rising sun, and he who had long been the most influential prelate in Ireland became thenceforth rather a memory than a living force, *magni nominis umbra*, the respected but discredited representative of an obsolete school and a bygone age. He retained indeed to the last, very justly, the reverence and affection of his own clergy and people, among whom he had always laboured indefatigably in the discharge of his pastoral duties; and when the jubilee of his episcopal consecration was solemnized in 1875, poor and rich alike united in testifying their sentiments of gratitude and respect for their venerable diocesan. Yet even here his satisfaction cannot have been wholly unalloyed, for a coadjutor, not of his own choice, and of the modern Ultramontane school, was thrust upon him in his old age by Cardinal Cullen, and became the real administrator of the diocese.

Once again, during these later years, at a critical moment in the history of his Church, the name of Archbishop MacHale attained a temporary prominence. Theology, as we have already observed, was not his specialty, though he had held for several years a theo-

logical professorship at Maynooth, and had published a work on the *Evidences and Doctrines of the Church*, which passed through three editions. But he was too good a theologian and had too hearty a dislike to despotism of every kind not to be strongly opposed as well to the infallibilist programme of the Vatican Council, as to the crooked tactics by which it was promoted. Possibly too, as is suggested in the *Letters of Quirinus*, there was a shade of personal feeling in the tone of his spirited rejoinder to the Irish primate; "it was the accumulated debt of twenty years he paid off to Cardinal Cullen." But the provocation at all events was not inconsiderable, when Cardinal Cullen—with such facts staring him in the face as the authorized circulation in every Irish diocese of Keenan's *Controversial Catechism*, which roundly repudiates the dogma of papal infallibility as "a Protestant invention"—calmly asserted that "the mind of Ireland has always been infallibilist," and appealed to the testimony of Dr. MacHale himself in support of this audacious paradox. "It made," we are told, "no slight impression when the grey-haired MacHale rose to repudiate the pretended belief in infallibility, not merely for himself but for Ireland." A month later, shortly before the end of the debate, the Archbishop again, according to *Quirinus*, "spoke with great severity against the decree, the fatal consequences of which he seems to appreciate better than most of his Irish colleagues." And in the voting of July 13 his name appears among the fourteen Archbishops who met the proposed new dogma with an indignant *Non placet*. It is true that he yielded afterwards and promulgated it in his diocese, and his imperfect grasp of theological and historical learning may have enabled him to offer this "sacrifice of the intellect," as Jesuit divines term it, with less conscientious difficulty, though hardly with less disgust, than some of his brethren, who, like Hanberg and Hefele, understood well enough the true nature of that "triumph of dogma over history" in which they tardily and reluctantly consented to acquiesce. The Archbishop of Tuam knew, indeed—none better—that the doctrine had been again and again formally repudiated by the Irish episcopate, and it must have gone sorely against the grain with him to take part in a public confession that on this fundamental point they had one and all misconceived the true teaching of their Church. But with doctrinal controversies, as such, he had never specially concerned himself. He was a man of war from his youth, and, hard as it might be to swallow the novel pretensions of an Ultramontane Pope, and a Pope who took Cardinal Cullen for his mouthpiece, it would have been harder still to seem to betray the cause of the Papacy, for which he had fought all his life against the heretic oppressors of his country and her ancient faith. With him has passed away the last perhaps of a race of ecclesiastics inflexible alike in their patriotism and their religious fidelity, in whom there was much to admire, if there was also something to desiderate and something to deplore. They were men who combined a Spartan independence of character with the zeal and patience of Christian martyrs, and of whom it may justly be said that they sought first the cause of truth and righteousness, as they understood it, and were content to let all lower and personal considerations take their chance. They were outspoken almost to a fault, and if their frankness at times degenerated into brutality, it was not when their own selfish interests or those of their order were at stake, but when they deemed that the rights of religion and liberty were being trampled under foot. If Ireland is less amenable than of old to priestly influence, that is not, from a social and political point of view, an unmixed advantage. Archbishop MacHale used at one time to be denounced, and not unreasonably denounced, as a firebrand, yet later experience has taught us that Irishmen may follow worse and more dangerous guidance. He never scrupled to show his hand, and could at least be reckoned on as a generous friend or an open foe. His co-religionists especially would do well to bear in mind that the genuine respect and confidence which he inspired throughout his long episcopate was bestowed on one who never forgot in the zealous and unwearied discharge of his official duties that he was a man, a citizen, and a Christian as well as a priest.

#### MR. IRVING ON THE DRAMA.

THE opening address of the present session of the Edinburgh Philosophical Institution was delivered on Tuesday last by Mr. Henry Irving, who was fortunate both in his subject and his audience. Edinburgh audiences, both at the theatre and at the Philosophical Institution, are deservedly famed for the intelligent encouragement which they give to good things; and Mr. Irving, who naturally enough selected "The Stage as It Is" as the text of his discourse, devoted himself to showing how the two interests referred to are really at one with each other. Mr. Irving, in his opening remarks, went straight to the point. He had chosen the stage for his subject "because to my profession I owe it that I am here, and every dictate of taste and of fidelity impels me to honour it"; and he had further chosen "The Stage as It Is" because "it is very empty honour that is paid to the drama in the abstract, and withheld from the theatre as a working institution in our midst." From this the speaker went on to descant, not, let us hope, too jubilantly, on the further text "*nous avons changé tout cela*." He congratulated his hearers and himself upon the fact that the habit of pretending to appreciate Shakespeare more in reading him than in seeing him acted had almost died out. This he justly described as being "a common method of affecting special

superiority"; and it is to be feared that this and cognate methods of affectation are not quite so dead as we might wish them to be, although, no doubt, much has been done by Mr. Irving and others to put an end to them. We remember well receiving from "a superior person," in answer to a question about the English stage, the reply that it was only French acting, and of that only the acting seen at the Français, which was worth the attention of a creature endowed with intellect. There will probably always be people who keep an intellect in this way, just as in other ways there are people who keep a soul, and probably also the wisdom of the two classes is about on a par. But it may, we trust, be considered that the amount of nonsense talked about Shakespeare's plays being more fitted for the closet than the stage is, as Mr. Irving said, diminishing. That the reaction should lead to such harmless, if extravagant, nonsense in the opposite direction as the grave presentment of the first quarto of *Hamlet* on a public stage by a company of untrained amateurs is, perhaps, a good rather than an evil sign. It is, after all, an attempt, however injudicious, to emulate the good results attained by the study and performance of practised actors, as to whose methods of arriving at their effects Mr. Irving spoke interestingly from his own experience. As soon, he said, as such an actor knows the author's text enough to feel self-possessed, without feeling the carelessness of familiarity, he begins, from the "mere automatic" delivery of the part at rehearsal and in performance, to get new lights thrown upon the meaning of what he has to do. To use Mr. Irving's own words, this action gives "the personage being played an individuality partly independent of, and yet consistent with, and rendering more powerfully visible, the dramatist's conception." From this we may conclude that Mr. Irving agrees with Diderot and with M. Coquelin in thinking that the actor should never be so lost in his own part as to be unable to preserve a personality of his own, which can watch and control the movements of the acted personage. In other words, if a sudden "inspiration" occurs to him of speaking a particular speech or making a particular action in a new and better manner, he must be master enough of himself to speak or move with the judgment of experience as well as with the force of impulse. His intonation and gesture must seem unpremeditated, but must not really be so. This has, as a matter of fact, been the rule with most fine players, and those who have departed from it have done so at the risk of frequently missing the great effects which their audiences have been taught to expect. Fine effects have, indeed, on many historical occasions been produced by mere stage accidents being turned to good account at the moment, and afterwards reproduced deliberately by practised actors. And of course the player who can note and make admirable use of such a thing as the chance unfastening of the garter outside his stocking can also, even while he is playing the beginning of a given passage in his accustomed way, conceive and execute a better way than he has yet found for delivering its conclusion. And it is no doubt the power which a fine actor has of catching new impressions, whether at rehearsal or in performance, and embodying them with due judgment in his playing, which "has led the French to speak of the creation of a part" by the actor who first plays it and makes it tell with the audience. In fact, in the case, at any rate, of a new part, an actor of power shares to a not inconsiderable extent in the author's invention, and, as Mr. Irving justly said, "French authors are so conscious of the extent and value of this co-operation of actors with them, that . . . they are uniformly lavish in their homage to the artists who have created on the boards the parts which they themselves have created on paper."

We have, however, been led away into the consideration of technicalities upon which Mr. Irving dwelt, as was fitting, but slightly in his address. A good deal of what he said was devoted to a consideration of the improved status of the stage as a profession; and, no doubt, there is here room for rejoicing. It may be questioned, however, whether Mr. Irving did not, consciously or unconsciously, overcharge his sketch of the past so as to heighten its contrast with the present. It is no doubt true that more young men of good education and breeding betake themselves to the stage as a profession now than formerly; but the proposition can hardly be advanced that in the last generation or two any stigma, out of extra-Puritan circles, rested on a man of breeding and education because he was an actor. It would be easy enough to adduce names to prove that this was not the case, nor perhaps did Mr. Irving mean that it was; but his statements and suggestions were, as reported, a trifle vague and sweeping. What, for instance, is the meaning of the assertion that "there are now few poor players. Whatever variety of fortune and merit there may be among them, they have the same degrees of prosperity and respect as come to members of other avocations"? Did Mr. Irving intend to say that there are now fewer "supers" and "utility people" than there used to be, or did he merely mean to emphasize the fact that players who do not pretend to the very highest artistic rank are more frequently seen at social gatherings than used to be the case? This, as we take it, is not entirely due to a marked change in the attitude of laymen. Before the days of long runs players had considerably less time than they now have for mingling in the outside world's amusements, and we have heard it suggested by a distinguished actor that the extent to which this is now done is not an unmixed good so far as the art of acting is concerned. However, no one will wish to dissent from Mr. Irving's general proposition that "the type" of people who make the stage a profession "is vastly improved by public recognition." But the same thing

might perhaps be said with equal truth of the type of some other professions, and notably of journalism. Mr. Irving, diverging from this point—to which, however, he presently returned—went on to speak of actors who "lament that there are now no schools for actors. This is a very idle lamentation. Every actor in full employment gets plenty of schooling, for the best schooling is practice, and there is no school so good as a well-conducted playhouse."

This is surely something like an avoidance of the question. We have never heard that there were at any time "schools," except on a small scale, for actors in England, and there are probably more such schools now than there used to be. Nor is any one likely to deny that, under certain conditions, the best possible schooling is to be got in a well-conducted playhouse. The question really is, whether, with the system of long runs, a playhouse, however well conducted, affords the necessary conditions. Far more actors now come upon the London stage than was formerly the case without having "gone through the mill"; and we have always understood that the necessity felt by some people for "schools" was partly due to the fact or belief that the old system of rough-and-ready learning by means of playing a number of different parts every week was on its last legs, and that something was wanted to replace it. The difference between playing, say Guildenstern in *Hamlet*, for a hundred nights running, and playing six or more different parts every week for the same space of time, is surely considerable, as far as mere training goes, to say nothing of the other difference between playing to audiences accustomed to express and audiences accustomed to repress their emotions and opinions. But Mr. Irving went on to contradict himself, apparently, in a curious way on this matter. Many fine qualities, he said truly enough, are needed for efficiency in acting, among them "considerable cultivation; delicate instincts of taste; and a power at once refined and strong of perceiving and expressing to others the significance of language." How all this is to be acquired or cultivated by playing the same part night after night we fail to see. Still less can we agree with Mr. Irving that "little of all this can be got in a mere training school, but all of it will come forth more or less fully armed from the actor's brain in the process of learning his art by practice." In the "mere training school" of the Conservatoire actors are certainly taught how to enunciate, how to emphasize, how to move well and effectively, before they try their fortunes before an audience. The proposition that it is better for them to be pitchforked on to the stage and learn all these things in the presence and at the cost of audiences would be absurd enough, and we can hardly suppose that this is what Mr. Irving intended. No doubt, "the way to learn a thing is to do it," but something should surely be learnt *in statu pupillari* before mastership is attempted. Mr. Irving's own success is a striking testimony to the value of early training in playing a variety of parts of altogether different calibre, and it would be matter for regret if, through any vagueness either in his speech or in the reporting of his speech, he should seem to depreciate the importance of this. With what he went on to say about the fussy people who think they have a mission for reforming the stage, we are disposed entirely to agree. What would be thought of a body of people who started an association for the "reform" of one of the "learned professions"? And yet the small amount contributed by the stage to the annals of crime is well known enough. As to the wider question of what may be called "the stage as a moral agent," what Mr. Irving said was well conceived and well put, although he naturally enough touched lightly, or not at all, on the success of pieces the chief attraction of which is a spice of indecency. The question really ends with the fact that people will go to see good things when they get the chance, and, so long as human nature remains what it is, they will probably also go to see things which are in a certain sense bad. But this need not prevent us from rejoicing that Mr. Irving's efforts to give them good things are untiring, and meet with full response.

#### WOMEN'S SUFFRAGE ONCE MORE.

THERE has been no debate on women's suffrage for two years in the House of Commons, owing, as the chairman of the annual meeting of the National Society for promoting this object showed conclusively at Manchester on Wednesday night, to imperative necessity. Lord Beaconsfield had to be got out of office, Mr. Gladstone to be got in, a few trifling regions of the earth's surface to be snipped off the British Empire, the Irish landlords to be taxed twenty-five per cent. *ad valorem* for the benefit of the Irish tenants, &c. It is even frankly acknowledged (and Mr. Hugh Mason could not know when he acknowledged it how fully his apprehension was being corroborated by Mr. Gladstone in London) that something else than women's suffrage may possibly occupy the House of Commons next year also. But Miss Lydia Becker is not discouraged, nor is Mrs. Oliver Scatcherd, nor is Mrs. Ashton Dilke, least of all is Mr. Hugh Mason, the chairman. His programme is announced. He is going to begin balloting as soon as Parliament opens, and to go on balloting *quand même*. If that will not suffice, it is clearly the fault of Miss Lydia Becker, "a master in Parliamentary procedure," for not telling him what else to do. There is evidently no lack of goodwill in Mr. Hugh Mason, and he is as evidently the right man in the right place.

Indeed, a careful student of theodicy and the newspapers cannot doubt, from the unvarying beneficence of Providence to the National Society for Promoting the Suffrage of Women, that triumph will ultimately be theirs. Their chairman (for they do not usually incline to chairwomen) necessarily changes. Mr. Jacob Bright gives place to Mr. Courtney; and Mr. Courtney, passing into the cold shade of office, gives place to Mr. Hugh Mason. The men pass away, but the characteristics do not. The characteristic of a champion of feminine rights is the production of at least one specimen of feminine logic, and the shibboleth is never evaded or baulked. Mr. Hugh Mason's evidence of fitness is, to say the least, as good as another's. It is not easy to produce a new argument for the suffrage of the unfittest, but every chairman of their annual meeting is bound to do so under penalties. Mr. Hugh Mason has risen to the occasion. He finds his in the election petitions and their consequences. "What," he said, "could be more unjust than the cases of women in corrupt boroughs such as Macclesfield and Oxford, where Royal Commissions had been sent down to inquire into the corrupt practices of the men there, and the women had been compelled to pay their quota towards the expenses of those Commissions?" Speaking from Mr. Hugh Mason's point of view, but with the application of masculine instead of feminine logic, we should say that the case of the uncorrupt male voters who did their duty, and yet are mulcted, was considerably more unjust, supposing that there is any injustice in the case at all. But we do not expect Mr. Hugh Mason, much less Miss Lydia Becker, to agree with us. It is sufficient to say that by this argument Mr. Hugh Mason has justified his selection. The torch of progress may be justly handed to him by his predecessor, whoever he was, without misgiving. It is not so clear to us that it was wise of Mr. Mason (in illustrating the difficulty of getting matters before Parliament) to instance his own struggles to get in a Bill about boiler explosions. A wicked critic might somehow or other take up Mr. Hugh Mason's two pet subjects, boiler explosions and women's suffrage, and make them a joint text for a sermon of a very shocking nature. The audience, however, was not wicked or critical, for no comment, at least in the published reports, betrays the slightest reflection as to the coincidence on the part of any of Mr. Mason's hearers. It would have been very unkind to make any such reflection on the favourite legislative projects, explosive or counter-explosive, of a man who had just pledged himself to go on balloting till all was blue, and who had, in the cause of woman, further proved his soundness by the argument about the Election Commissions.

The followers of Mr. Mason were not quite so interesting, because they were less novel. That Mr. A. G. Symonds should take the opportunity to remind the meeting of "his opportunities of knowing the opinions of members of Parliament" was natural, and the announcement may have been interesting—to Mr. A. G. Symonds. That the same person (who is principally known as the Secretary of an exceedingly pragmatical body, calling itself the National Reform Union, which as a matter of fact lives and moves in the Manchester equivalent for Tooley Street) should assert a simultaneous acquaintance with dwellers in the rural districts, and assure the assembled women that extension of the county franchise meant women's suffrage, because the labourers were "thoroughly agreed on the question," was more attractive. The rurality of the dwellers in Tooley Street, Manchester, is undoubted. The probable opinion of the average agricultural labourer as to the political rights of his wife, and the means which he would take for enabling her to exercise those rights in a thoroughly free and independent manner, are undoubted likewise, at least to persons who do know something of the "dwellers in agricultural districts." Mr. Symonds was followed by Miss Carbutt. Miss Carbutt's argument for the enfranchisement is that "the sense of responsibility which it would give to women would prevent their being interested in the frivolities which at present were almost the only things to which women who had not to earn their living could turn." Frivolities is good, but "almost" is better. The frivolity of household duties, of looking after the sick and poor and needy, of smoothing the rough places of the world and healing the wounds of the world's victims—not to speak of self-cultivation and the practice of those branches of art and literature which are traditionally open to women—is an ingenious conception, and Miss Carbutt is to be thanked for it. This single jewel is a bright one, and we do not know that it is outshone by the galaxy of beauties which may be extracted from the subsequent oration of Mrs. Ashton Dilke. The utterances of Mr. Ashton Dilke lately have betrayed a painful mental condition of backsliding and doubt. Unless his reporters have belied him, he has washed his hands of the Irish as impracticable; he has spoken of the representation of minorities (which his reverend senior, Mr. Bright, knows to be an invention of the Devil and Lord Beaconsfield in conclave assembled) as a reasonable thing, and he has even hinted doubts of the excellences of the caucus. Mrs. Ashton Dilke (and this is a great argument for the women's suffrage people) knows no such variability. "Women had gained so much from constitutional liberty that they would be the last to deprive their fellow-creatures of it." There is a slap in the face for Mr. Gladstone, and a healing balm for the victims of tyranny at Kilmainham! "If women had votes in Ireland there would be less lawlessness displayed." This is the sort of assertion which it is difficult either to prove or to disprove. The Ladies' Land League, however, and Miss Anna Parnell's spirited and memorable rides across country in order to induce the lagging tenant to "get up and bar the door"

against the hateful sheriff and his posse seem to render the statement a little doubtful. Mrs. Ashton Dilke, however, has reason for her rhyme. "Women," she knew, "were inclined to carry out an agitation in a peaceful manner. They would not go beyond constitutional bounds." On the whole (for, in the pursuance of an inveterate, though obsolete, habit of deferential gallantry we shall supply Mrs. Ashton Dilke with the arguments which she seems to lack), it appears that women's suffrage might have one good effect in Ireland. Free and independent electresses might object to be set in the forefront of the battle to shield their husbands and brothers from constabulary buckshot. But the consequent slaughter of the noblest and most chivalrous peasantry on earth, or else the disunion which would inevitably result in households at present united in the bonds of the Catholic faith and of a desire to pay no rent, are heavy drawbacks to this advantage.

The *Women's Suffrage Journal* is always active just before the annual display of strength. This year, an account of a meeting at Sheffield some thirty years ago has been exhumed to cheer the daughters of liberty. There is an editorial comment on this which explains the matter. But the account itself appears in a different part of the paper without any warning heading; and it is rather a shock to read, after a report which might be that of proceedings held yesterday, that "a memorial was voted to Lord John Russell." It certainly seems, till the facts are appreciated, that it is a case of "flectere si nequeo superos Acheronta movebo." However, further examination and the comparison of the before-mentioned editorial remarks show that Lord Russell's venerable ashes are not to be disturbed, and that the meeting took place about 1849. We think we like Miss Anne Knight, who seems to have been the Miss Lydia Becker of those days, better than the existing master of Parliamentary procedure; but this may be merely the unfair predilection for the past which influences some minds. Miss Anne Knight, it seems, used to talk about "the three hundred slaughtermen"—which did not refer to journeymen butchers, but to members of the House of Commons connected with the Army and Navy. There is a passage, too, in Miss Knight's oration which, though some allusions in it are a little dark to us, has much picturesqueness and pathos. "She had asked Edward Smith to be present on that occasion, but he had his fears about Socialism, and also objected to music. She would rather not have had the music, because her woman's harp was hanging on the willows, and it must be almost a mockery to their poor Hungarian brethren to be requested to play the songs of their fatherland in the land of strangers." Edward Smith, who objected to Socialism and music at public meetings, must have been a very sensible fellow, and we like Miss Knight's references to her woman's harp. There is a distinguished poetess of the present day who talks just like this in her prefaces, though, to do her justice, we do not remember to have seen her name at a women's suffrage meeting. After the pathetic description of her harp, Miss Knight exhorted her hearers to "send their lights down to the south," "she hoped their beacons would be lighted through the country till they warmed the heart of cold London," in which phrase, indeed, the speaker seems to have anticipated, in different ways, two great men of the present day—Mr. Gladstone and Mr. George R. Sims. There was a Mrs. Higginbotham, too, in 1849 who was very nice. She spoke in moving terms of "the wives of soldiers and sailors, unable to represent their country in their country's cause while they were far off on the sea, or compelled to an automaton submission to ravage with fire and sword their unoffending brethren of different lands at the tyrant's bidding" (the tyrant, by the way, was that same gracious monarch who is now the Women's Suffrage Society's stock argument for its demands). All this is much racier than Mr. Hugh Mason's logic and Miss Carbutt's arguments about frivolities, and not much more unreasonable. The correspondent who forwarded this undated *trouville* to *The Women's Suffrage Journal* should be applied to for more of the same. Miss Anne Knight and Mrs. Higginbotham, who depicted soldiers and sailors ravaging their brethren with sword and fire, would be a welcome change after Lady Harberton and Mrs. Scatcherd, Miss Becker and Miss Helena Downing.

#### THE LONDON FISH SUPPLY.

THE proceedings of the Corporation of London in the matter of the metropolitan fish supply afford an interesting and pleasing contrast to those of the Metropolitan Board of Works. It must be allowed in fairness to the latter body that, if they had not moved in the business, the superior merits of the Corporation might never have come to light. Whether as effect or as coincidence, the anxiety of the Corporation to improve, and if needful to supplement, Billingsgate has been greatly quickened by the action of the Board of Works. But, since the two authorities have taken the question in hand, the action of the Corporation has been very much to the purpose, while the action of the Board of Works has come to nothing at all. At their meeting last week the members occupied themselves in rejecting one motion after another without seeming to have any clear conception of what it was they wanted to do. If the majority of the Board are really of opinion that the action of the Corporation has made it unnecessary for them to do anything further, they had better have said so plainly. They may hold that, if the compe-

tion of the Board of Works be withdrawn, the zeal of the Corporation will grow cold, but in that case they should either have adjourned the further consideration of the question until it has been seen what the Corporation is going to do, or have devoted themselves to the provision of a fish market in some quarter of London where the Corporation does not propose to set up one. If they are inclined to come to a compromise with the Corporation, they should have laid down plainly the lines on which they propose to base an arrangement, and then have suggested a conference between representatives of the two authorities. As it was, they simply threw overboard a series of premature or unwise proposals, and separated without coming to any conclusion at all.

The motion first put to the Board was one in favour of a site between the Great Northern and Midland Railways, now in the possession of the Gas Light and Coke Company. Whether this site is the best that could be chosen for a market for railway-borne fish it is not our business to say. But it seems plain that, if it is chosen, there will be no need for a market on the site recommended by the Fish Supply Committee of the Common Council. Two markets north of the Thames in addition to one at Billingsgate are only likely to ruin one another; though it may well deserve consideration whether, as the Corporation propose to enlarge Billingsgate with the view of making it adequate to the increased demands of the trade in water-borne fish, the provision of a market for railway-borne fish might not advantageously be left to the Board of Works. A conference between the Board and the Corporation might have ended in the adoption of this compromise, and so saved a considerable expenditure of public money. The motion actually submitted to the Board made no mention of the Corporation scheme, but simply recommended the immediate establishment of a market upon the northern site. Supposing that the Board of Works are to set up a market without reference to the Corporation, it would be better to place it on the south side of the river, where it would, at all events, have the field to itself. A market in the north of London will be of no use to the railways south of the Thames; and, though in their case the competition of water-borne fish would be severe, there is no apparent reason why a railway fish trade could not be created on the southern coast which would be of considerable advantage to the metropolitan districts of Kent and Surrey.

On the previous day the Court of Common Council had been busy with the same question. On the 15th of September the Fish Supply Committee had been instructed to consider and report as to the cost of obtaining a site at Blackfriars, "and any other sites," and they had very properly interpreted the insertion of the words "and other sites" as an intimation that the Court desired to obtain all available information upon the question. They accordingly advertised for suggestions as to the best position for a fish market, and received one hundred suggestions. Thirty-two of the sites recommended were viewed by the Committee, and, in the end, four sites—Billingsgate, Blackfriars, the Central Markets in Farringdon Street, and a site near the Midland Railway—were referred to the City Architect for further consideration. The Committee came eventually to two conclusions; one, that the public feeling in favour of having two fish markets was strong enough to overbear the Committee's own conviction that one market is sufficient. That the public are in the right in thus thinking we have no doubt at all. It is impossible that in a crowded city like London the same market should be equally suited for the sale of water-borne and railway-borne fish. In the first place, if the whole supply is brought together in a single market, the block in the neighbouring streets will be proportionately greater. There will be more carts to be brought up, loaded, and sent away. In the second place, the requirements of the two methods of transport are different. What is wanted in the case of water-borne fish is that the market should be near the river. What is wanted in the case of railway-borne fish is that it should be near the railways. Unless the railways are brought down to the river-side, which in London may be said to be only possible at one point, these two requirements cannot be combined. The river is in the centre of the City; the railways, or at least those which bring most fish, are still, speaking comparatively, in the outskirts. If Billingsgate remains the only market, the fish brought by the railways north of London must be unpacked on its arrival and carted down to the river-side. If Billingsgate is replaced by a single inland market, the fish brought by river must be unpacked on its arrival and carted to the neighbourhood of the northern railways. What the public desire is that this useless transshipment shall be avoided, and by the plan of a double market it is avoided. The only argument in favour of the Blackfriars site lay in the fact that it was near both to the river and to a railway over which all the fish coming to London from the North might easily be carried. But Blackfriars is open to the grave objection that it is above bridge, and it is not at all clear that this change would not be exceedingly disadvantageous to the trade in river-borne fish. To have to pass two bridges may, at some stages of the tide, appreciably increase the risks of transit. This objection is the more weighty because it is not balanced by any reasons pointing to the superiority of one market over two. Even if the fish brought by river and the fish brought by railway could be conveniently landed at one and the same place, the argument in favour of having two markets rather than one would be very strong. So long as there is only a single market, it must be easier to make the prices charged in that market a matter of arrangement than it would be if there were two markets bidding, to some extent, against one another. As it is in the interest of the public that

prices should not be made a matter of arrangement, it would be better to have two markets rather than one, even if there were no other considerations pointing that way.

It is much to the credit of the Fish Supply Committee that they took the wishes of the public as their guide, although that wish was in contradiction to their own expressed opinion in favour of a single wholesale market by the river. The recommendation of the Committee was accepted by a large majority of the Common Council, but not without considerable resistance. The Opposition had on their side the fact that, though the proposal of the Committee will provide an excellent market for railway-borne fish, it will do so at the sacrifice of another kind of market, which is also very much needed. The building which it is intended to make a fish market was originally designed for the sale of fruit and vegetables; and though, on the supposition that only one new market can be had, fish is undoubtedly a more important article of food than fruit and vegetables, it is unfortunate that the two should thus be pitted against one another. It was not, however, to this point that the opponents of the Committee chiefly directed themselves. To some members of the Court it seemed a terrible surrender of corporate dignity that a Committee of the Common Council of London should have so far forgotten itself as to bow to public opinion. To do this, said one deputy, was to tread on very dangerous ground. Billingsgate is evidently regarded by a minority in the Common Council, not merely as under the circumstances the best site for a water-side market, but as the spot to which, by a sort of Divine appointment, all the fish that comes to London must necessarily go. They are not afraid that when a second market is opened any of the fish will be taken there. Heaven can protect its own, and there will be no fish market but Billingsgate, no matter how many other places may have the name given to them in irony. What troubles the minority is that the Common Council should be found fighting on the wrong side. Billingsgate will win, whatever other markets there may be in the field; but it makes all the difference to the faithful citizen whether it wins with the Corporation as its friend or as its enemy. Until the experiment has been tried and failed, the uninstructed public will go on believing that one way of cheapening fish is to place the market as near as possible to the point at which the fish arrives, and that another way is to make it the interest of the dealers in two rival markets to undersell one another. It is quite intelligible that the deputies who represent the ward of Billingsgate should not see things in this light. The fish supply of London has until now been a very pretty monopoly, of which Billingsgate has had the exclusive control. There is no need to displace it from its position as a market for river-borne fish, since for that it is admirably suited; but it certainly ought not to be retained as a market for a branch of the trade the requirements of which it does not in the least meet.

#### THE GENERAL POST OFFICE.

THERE are few more interesting ways of passing a morning than to spend it, under proper official guidance, in the General Post Office. Of all Government departments, there is none which works with the same smoothness and perfection. The very certainty and regularity with which it discharges its functions tends to make us forget how complicated and how skilfully adapted to its work must be the machinery which performs it. The Gas Company and the Waterworks Company give us frequent and inconvenient reminders in our households of the imperfections of their respective systems; but, when the first movements of righteous indignation are over, we can reflect how difficult must be the task of supplying a city like London with gas and water. The Post Office gives us no trouble; the tax we pay to it is distributed in trifling sums over the whole of the year, does not visit us in the form of a rate, and is of that least vexatious kind which we pay in exact proportion to the work which we ask Government to do for us. Even those whose reading has made them more or less familiar with the work done at the General Post Office cannot see the machine in action without a feeling of astonishment at the skill which has gradually carried to such perfection, and is constantly developing, so vast an organization. There is no department in the Post Office and Postal Telegraph Office which does not repay a visit, though some are of course more impressive or more curious than others. The most striking, perhaps, is the central hall of the Telegraph Office.

In this hall, with the annexed wings, a thousand operators may be seen at work. The ceaseless din of the machines reminds one of the great factories in our Northern centres of industry. As an instance of the amount of work which is done in this office, it may be mentioned that one wire only suffices as means of communication with Birmingham, Manchester, and Liverpool, and a second with Newcastle, Glasgow, Edinburgh, Dundee, and Aberdeen. Two hundred words a minute can be transmitted along each of these. Some of the wires, on the "quadruplex" system, allow of two messages being sent simultaneously each way. About fifty thousand messages pass daily through the office. Much of the labour of telegraphing from the central office to neighbouring points of London—such as Charing Cross or the Houses of Parliament—is done by means of pneumatic tubes, through which bundles of telegrams are sent for distribution in the respective districts. The journey through these tubes from the central office to Charing Cross takes about four minutes. The furthest distance to which

the pneumatic system has as yet been carried is the House of Commons. Some of the work of telegraphing is done by automatic machines, Greenwich time being sent in this way to all the great towns throughout the country. Down below, on the lower stories of the same building, are the engines—one for pulping up old messages, and two, each of 50-horse power, for the pneumatic tubes, one of which pumps while the other exhausts. Here, too, is the battery room, with three miles of shelving and twenty thousand cells. Special knowledge is needed fully to appreciate the skill and ingenuity which the various arrangements in this department display; but no observer can fail to be impressed both with the colossal magnitude of that work which concentrates the business and interests of every part of the country and every quarter of the globe into this one room, as into no other place in the world, and with the precision and fidelity with which the work is performed.

In the Postal Department there is, perhaps, less to impress a casual observer, unless, indeed, the visit is made at the hour when the general night mails are making up. The organization which is able to cope with the deluge of letters which pours in upon the office is then seen at its best. But, apart from the amusement of a sensational *coup d'œil*, more is learnt of the working of the system by going round the office in the quieter hours of the day, and tracing the history of a letter from the time it enters to the time it leaves the building. As fast as the letters drop from outside into the receptacles prepared for them, they are carried to the nearest tables, where the process of "facing" is gone through—that is, they are all put with the addresses on the same side, and the right side uppermost. This done, they are carried further to be stamped. The same machine which does the stamping also puts the obliterating mark on the postage-stamp of the letter. Then comes the sorting, which is subdivided into three stages. The first assigns the letter to the railway line which goes to, or nearest to, the town or village to which it is addressed; in the second, all the letters which go by each line are again divided into districts, or groups of towns; in the third, the bag for each place is finally made up. Much of the primary sorting is, in the case of the letters which pass through London from one part of the country to the other, done in the country offices from which they start. When, in the primary sorting, there is any difficulty as to the address, the letter is put into a division above the desk marked "Blind"; it is then handed on for further examination to a fresh set of officials, and then, if they are not able to make anything of it, it is passed on to the Returned Letter Office. The method pursued in the department for foreign correspondence is substantially the same. In the Registered Letter department the principle is somewhat different. Each letter, from the time when it leaves the hand of the sender to the time when it is delivered into the hand of the receiver, has to be accounted for by a written receipt every time that it passes from one person to another. The system is not an absolute guarantee of safety, as may be seen from the thefts of registered letters which come before the police courts; but the danger of detection in such cases, especially when the theft is repeated, acts as a powerful deterrent. And, considering the enormous business done by this department, and the rare cases of theft which occur, the system seems to give all the practical security attainable. It is hard to imagine any other, not involving an inconvenient amount of trouble and delay, which would be safer for the public. It is curious to see the great pots of molten wax, standing in a row on the desks, with which the sealing in this department is done. Whenever an especially interesting or curious address occurs, whether on a registered letter or not, it is recorded in books provided for the purpose. One may be quoted as an example:—"Mr. Paddy O'Rafferty Shaughnessey—The Beautiful Shamrock—Next door to Barney O'Flynn's Whiskey Store—Stratford-on-Avon—In the County of Cork, if ye like Dublin." It may be added that the art of sorting letters, which does not come by nature, is taught in the Post Office itself, where classes of boys may be seen receiving daily instruction in the craft, and practising with dummy letters before their teacher.

The most curious department of the Post Office, and that most fertile in odd and amusing incidents, is the Returned Letter Office, off Moorgate Street. It is here that all letters are sent and opened, the owners of which cannot, for some reason or other, be found. If human ingenuity can discover the writer or the person to whom the letter is addressed, one or the other gets it sooner or later. But in many cases this is impossible, either because the addresses and the headings are wanting, or are illegible, or are erroneous, or else because the parties are dead, or have quitted the neighbourhood, leaving behind them no clue to their whereabouts. It is remarkable, considering how illiterate and unintelligent the mass of the people still are, that only one letter in two hundred fails to be duly delivered. Carelessness, too, has almost as much to do as ignorance with the faulty addressing or fastening up of letters. Last year seventy-eight thousand letters containing articles of value passed through this department; and twenty-two thousand articles escaped from the flimsy covers in which they were wrapped. Two-thirds of the letters, the addresses of which cannot be found, are returned to the senders. Each official opens daily from five hundred to six hundred letters; and about three hundred inquiries are answered every day. The opening is done by men, as the contents of the letters opened are often of the most unavourable kind; the re-addressing and returning are done by women. It is found that the women show a capacity for their work equal to that of the men, but that their power of enduring consecutive labour is by no means the same. Not only does the Returned

Letter Office do its work of returning letters as well as it can be done, but the facts which its work discloses have a curious statistical value, as showing the sort of letters and parcels that pass through the post, of which those that are ill-addressed afford probably a fair sample. The parcels are marvellous. We find not only every conceivable article which can be found in a pawnbroker's or a haberdasher's shop, but birds, beasts, reptiles, fish, insects, and molluscs. A short time ago a wasp's nest was among the temporary treasures of the department. Shortly before a lizard and a slow-worm (insufficiently directed) found their way to the same office. They had been packed in the same box, and, when opened overnight, appeared to be living in peace and amity. The following morning it was reported, as a remarkable phenomenon, that one of the creatures had vanished from the closed box; on examination it appeared that the lizard had indeed gone from sight, and that the slow-worm was enormously swollen in his digestive parts. On one occasion a number of torn letters were forwarded to the department from a letter-box into which a mouse had been thrown by some playful spirit. It turned out that the mouse had left all of the letters untouched except those which contained postage-stamps; but its sense of smell had guided it to all those with stamps in them, and it had bitten through the covers and eaten away at the adhesive gum on the backs of the stamps. It often happens that the parcels which find their way to this department contain ill-smelling objects, such as decayed fruit and flowers, dead birds, stale meat, and rotten oysters. For the comfort of the openers these parcels are sent up from the ground floor to the upper story, where they are examined in an iron lift fitted outside the walls, which halts at the window of the examining room. The parcels can thus be opened and investigated without the offensive smells penetrating into the room itself. Sometimes a slice of paste or of old plum-pudding is found in a letter; why such a thing should be sent at all is a puzzle, till a close examination shows that it contains sovereigns, hidden in it with a view to escaping the registration fee. For the same reason sovereigns are often concealed in newspapers. It frequently happens that unaddressed letters, when opened, are found to contain cheques, sometimes to a very large amount. These it is of course easy to return, through the banker, to their owners. But, with the best will in the world, the department is left with a mass of articles of every conceivable kind on its hands, which at intervals of three months are sold by auction. Among these are empty, unaddressed purses, which are constantly found in letter-boxes, put there by thieves who have transferred the contents to their own pockets. House-keys are also frequently found in the same places, dropped into them by tenants who have left their houses without paying the landlord his rent. Sometimes, however, they politely attach a label to the key, with the name and address of the landlord, thus signifying to him that he may look out for another and more solvent occupier. From the old name of the Dead Letter Office a popular belief arose that all inquiries as to persons dead or missing, or as to soldiers or sailors who have not been heard of by their friends, should be made there.

Some of the misdirections of letters are very curious. One to "Owl O'Neill" was for a long time a source of much perplexity, till at length some quick-eared official, caught by a certain similarity of sound, suggested, as it proved correctly, that it was meant for "Rowland Hill," the writer having apparently often heard the word pronounced, but never seen it written. A telegram is sent to "Capt. Troller," which turns out to be intended for the "Controller" of the department. A letter is sent to some person who cannot be found signed "Rank and File"; a young clerk in the office, new to his work, takes this to be the name of a firm, and readdresses it "Messrs. Rank and File." Another is addressed:—

Private Jones,  
Nemo me impune lacessit,

the motto of the regiment being taken to be part of the address. A medical certificate is among the treasures of the department, worded as follows:—"This is to certify that I attended Mrs. — in her last illness, and that she died in consequence thereof." Singular answers to advertisements as to the boarding-out or adoption of children occur—e.g. "Allow me to state that I am not a lady, but that the father of the child is a perfect gentleman"; and, again, "I am sorry to say that I am a young person, and that I have a dear little boy." An envelope containing a pair of spectacles is sent, apparently by a servant-girl in London, to "My dear Father in Yorkshire, in the white house with green palings." There is a letter by a mad person, summoning a friend to appear on a certain day for judgment in the next world, whence the letter is dated. A woman writes to say that the foot-and-mouth disease is caused by the prevalent practice of burying people alive, and signs herself by her "professional name" of "Anna the Prophetess" and by her "general name" of "Miss R—." The attention of the department is particularly called by the Prophetess to this baleful custom. She ejaculates, with as much truth as fervour, "What an awful position to be placed in!" A man in Cheshire writes a letter to the Coroner and Jury who are going to hold an inquest on him after he has committed suicide. It is full of bitter complaints against his friends. Either, however, his courage failed him, or he came to take a more cheerful view of life; for he did not commit suicide, after all; and thus the letter reached the Returned Letter Office, and not the Cheshire Coroner. There are two classes of persons,

one of whom always get the letters written to them, and the other of whom always get returned to them the letters which do not reach those to whom they were written. The first consist of people of title, whose addresses are always to be found in the Red Book, and the second of those people, generally men of business, whose name and address are stamped on their envelopes. These, indeed, get their letters back unopened, and not even the officials of the department are initiated into their secrets.

#### THE SUNDERLAND LIBRARY.

SIX years ago the amateurs of great collections were excited by the sale at Christie's of the celebrated Marlborough gems. Although these were sold at one bid for the large sum of thirty-five thousand guineas, it does not seem to have been quite as much as was expected or perhaps required. The gems were collected by the third Duke of Marlborough, who inherited the strong family taste for accumulating works of art from his ancestor, the third Earl of Sunderland. His son was that Marquess of Blandford so celebrated by "Froggy" Dibdin, who collected the Whitknights Library, and paid at the Roxburgh sale, in competition with Lord Spencer, the then unprecedented sum of 2,260*l.* for one book, the Valdarfer *Decameron*—in honour of which the still flourishing Roxburgh Club was instituted. When Lord Blandford succeeded to the dukedom the Whitknights library was sold. This *Decameron* then fetched about one-fourth of what it had cost, although at a later period it passed, at a price intermediate between its first and its second, into the hands of Lord Spencer. Curiously, however, another copy of this most rare book, not quite perfect, was already at Blenheim. It will be included in the coming sale of what may be termed the Sunderland Library. This collection was made by Charles, third Earl of Sunderland, in the reign of George I. He was not the well-known statesman to whom there are so many references in the history of the Revolution of 1688, but his son, himself one of the principal Secretaries of State under Queen Anne and George I. In the Catalogue of the Sunderland Library, to which we shall presently have to make fuller reference, the collection is said to have been formed by the Earl "in the reigns of George I. and II."; but he died in 1722, and George I. survived him more than four years. A mistake like this on the threshold causes a feeling of distrust as to the rest of the preface to the Catalogue. Earl Charles married the second daughter of the great Duke of Marlborough, on whom and her descendants the honours and estates were settled, to the prejudice of the senior line, now represented by the Duke of Leeds. One of his great-grandsons was that George John, second Earl Spencer, who, under the fostering care of Dr. Dibdin, formed the famous library of which, during his lifetime, the early books were placed in Spencer House, London, and the remainder at Althorp, but which were, after his death, concentrated at the latter place. His rival at more than one celebrated auction was his cousin, the Lord Blandford mentioned above; and we read in Dibdin's high-flown account of the Roxburgh sale that Lord Althorp, the future Chancellor of the Exchequer, stood by his father on that great occasion. The Sunderland Library was transferred to Blenheim in 1733, when the son of its collector succeeded his aunt, the Duchess Henrietta. It does not appear to have been increased even by that great book-fancier the fourth Duke, and it remains substantially what it was in the early years of the house of Hanover. Accordingly it possesses a certain unity of character as the collection of a bibliomaniac whose means equalled his tastes, and who lived more than a century and a half ago. This peculiarity makes its dispersion a matter of special regret. In its entirety it is a monument. It has not been brought together for scoffers like Charles Lamb, who expressed himself strongly about what he calls *biblia abiblia*, among which he reckoned court calendars, directories, pocket-books, draught-boards bound and lettered on the back, scientific treatises, almanacs, statutes at large, history in general, and, in short, all those volumes which "no gentleman's library should be without." It vexed him to see such "things in book's clothing perched upon shelves."

We shall be curious to see the prices fetched in these days by a collection of which the chief rarities are the once much-prized *Éditiones Principes*. The chief works are, so to speak, of a monumental character. They were of more value in their place on the shelves of the Blenheim Library, and in their relation to one another as parts of a collection of historical interest, than they can possibly be when dispersed by the hammer to the four quarters of the globe. Still, if the Liverpool or Birmingham or Glasgow people, about whose newborn literary taste we hear so much, wish for a substantial foundation for one of the great Free Libraries of the future, they will have now an opportunity, never again likely to occur, of imitating Mr. Bromlow's sporting and successful first bid for the Marlborough gems in 1875. It is curious to look at the sums realized at some of the great book sales of late years. The Bragge collection, consisting wholly of illuminated manuscripts some five hundred in number, was sold for about 12,000*l.* The Perkins library went for 26,000*l.*, including 6,000*l.* for the two Mazarine Bibles. Sir William Tite's collection, one of the choicest ever brought to the hammer, produced about 18,000*l.*

The first portion, of which the Catalogue is already in the hands of the bibliomaniac, consists of two thousand seven hundred lots, many of which will no doubt be lumped together at the sale. It comprises names from Abelard to Chardin, so that, according to

the usual analogy of catalogues, it may be considered to represent a fourth part of the whole library. The alphabetical order has been adopted because, as the preface informs us, by far the greater part of the library is strictly classical. There are, for instance, not fewer than thirty-five editions of Catullus, and fifty-two of Cæsar, including the first, or *Ediitio Princeps*. Among the other classical first editions are those of Æschylus, Venice, 1518; Æsop, Venice, 1498; Apuleius, Vicenza, 1488; Aristophanes, Florence, 1517, and many more of lesser note. The Bibles are by no means so remarkable, but there is a copy of the first complete Greek version, the Aldine of 1518, and a very fine one of the second edition of the Vulgate—namely, Eust and Schoeffer's, of 1462. This copy is printed on vellum, and is only inferior in interest to the undated Bible known as the Mazarine. It is large, sound and perfect, says the Catalogue, the leaves being 16½ in. by 11½. The Perkins copy sold for 780*l.*, and this one is in every respect equal to it. Among the English Bibles are a few of considerable value. The earliest is Whitlure's edition of the "Great Bible," 1541, the forerunner of our so-called Authorized Version. It seldom occurs in a perfect state, having in most cases been worn out in parish church desks. The present copy is described as "perfect and generally sound and clean." Next comes the Bishop's Bible, of which this is "probably the presentation copy" to Queen Elizabeth on the part of the printers. It has her arms and initials on the binding, but is not of the first edition. Nor is there any copy of King James's first, the earliest being only of 1619. There is a "Vinegar Bible" (1717) on vellum, which is a rarity, and some early French and Italian editions, but little else of importance in this particular department. Among romances the first place must be given to the Valdarfer Boccaccio, already mentioned, this copy of which wants five leaves, being therefore inferior to that now in the Spencer Library, which is perfect. There is a copy, nearly perfect, of the Mantua edition of 1472; but the compiler is in error in saying it is "probably the only copy existing in this country." Lord Spencer has one, but it is very imperfect. It was at the Caxton Exhibition in 1877. There are in all some sixty-five volumes of various editions of Boccaccio's different works, including the rare Giunta of 1527, the rare Aldine of 1522, and above all the Bruges edition of the "Nobles Hommes et Femmes," which was printed in 1476 by Colard Mansion, who, according to Mr. Blades, and, in fact, all modern authorities, was Caxton's master in the art of printing. Of Caxton there is only his Chronicle, printed by another and later hand; but a good many early editions of English poets occur, or will occur in future parts of the Catalogue. The preface calls especial attention to the number of books printed on vellum, but only a few—some sixteen or seventeen—are included in the December sale. Of these, besides what we have noticed above, perhaps the most important is St. Augustine's *De Civitate Dei*, of which there are two editions, one dated 1470 and one 1475. The early Italian poets are well represented, and the next instalment will, it is understood, include a Dante manuscript. The Chronicles, Councils, county histories, and historical tracts do not come into the first sale, which is fixed to take place in December, at the auction rooms of Messrs. Puttick and Simpson, where the books will be on view during the last week of November.

#### BANKS AS PROMOTERS OF SPECULATION.

ACCORDING to the statistics published twice every year by the *Economist*, the banks of the United Kingdom last month held between five and six hundred millions of deposits. Of course the whole of this vast sum does not really represent deposits in the sense usually understood by that word by the general public. A part of it is reckoned twice over; as, for example, the bankers' balances figure in the accounts both of the Bank of England and of the depositing banks. A portion, also, consists of the proceeds of loans and discounts. When the holder of a bill gets it discounted, or when a borrower obtains a loan from a bank, the proceeds in either case are entered to his credit in the books of the bank. As a rule, the advances so made are not withdrawn from the bank in cash, but are paid away by means of cheques, and thus appear only as book accounts. Lastly, a large portion consists of current accounts. But, when we have made the fullest allowance on all these scores, the actual deposits—the savings, that is, of persons who lodge their money with banks either while awaiting a suitable investment, or because they know not how to obtain a better interest for it—are enormous, and against these deposits the only reserve held is that of the Bank of England. As we showed quite recently, the reserve held by the Bank of England has for weeks oscillated about 10 millions, once actually dropping below that amount, then rising again, only to fall once more. The other banks, as we then pointed out, really keep no reserves. The balances which they maintain at the Bank of England are only kept for the purposes of the Clearing House, and in strictness must be regarded only as till-money. The till-money, again, which they keep on their premises to meet the demands that may come upon them from day to day, is not a reserve in any sense of the word. And the only other provisions they make against sudden and large demands upon them are the loans which they advance to the bill-brokers either on call or for very short periods, and their investments in securities. The loans to the bill-brokers, however, are just as little a reserve as till-money itself, for the bill-brokers have no reserve upon which to draw; and whenever it becomes necessary for the banks to withdraw the money lent with them,

the bill-brokers have no option but to go to the Bank of England. Lastly, the investments in Consols and other high-class securities do not constitute a reserve proper. If a panic were to occur, it would be impossible to sell these securities, and the securities themselves would be of no avail as payments. We come back then to what we have already stated, that the only reserve in the United Kingdom is that held by the Bank of England, and that that reserve does not amount to sixpence in the pound of the deposits generally; in other words, were a run to be made upon the banks, there is no reserve upon which to draw but that held by the Bank of England, and that is utterly inadequate so long as the law is enforced. It seems at first sight incredible that men usually deemed so prudent and careful as bankers should make no provision against liabilities of such enormous amount, and which at any moment they may be called upon to liquidate. But the fact is that they have grown accustomed to depend upon the Government. They expect the Bank of England to stand by them should a crisis arise, and, when the Bank of England itself becomes endangered by this course, they expect the Government to authorize an infraction of the Bank Charter Act. This is not a very satisfactory state of things, and means ought to be taken to put a stop to it. The Bank Charter Act has already had frequently to be suspended, and as things are now, it is very likely that it will have to be suspended again. The only way, however, in which this can be avoided is by the banks themselves keeping an adequate reserve in addition to that kept by the Bank of England, and there are other reasons, as we shall presently show, which make it extremely desirable that this should be done. We readily concede that a run such as we have been speaking of is less likely now than in the past. The public is better educated, understands financial questions better, and is not so apt to lose its head in a crisis. The failure of the Glasgow Bank showed this very clearly. If the Scotch public had then taken alarm, they might possibly have compelled all the other Scotch banks to have closed their doors; but, in fact, the other Scotch banks were at no time in danger. It is not probable, therefore, we admit, that a run should be made upon all the banks of the country; but it is possible, nevertheless, that such a thing may occur, and it is certainly not improbable that a run may occur upon one or two of the banks in particular, and may cause serious disaster. Even at the time of the Glasgow Bank failure there was a run for a short time upon one of the greatest and best-managed of the London joint-stock banks. Happily it stopped before any unpleasant consequences followed; but the fact that there was even a partial run shows that occasions may arise in which panic may seize the depositors in well-managed and perfectly solvent banks, and may lead to very disastrous results.

The ultimate reason, no doubt, why the banks keep no real reserve is that they are obliged, as a rule, to pay interest upon the deposits they hold. If they were to keep a considerable portion of these deposits idle they would lose money, and consequently they are eager as far as possible to employ every halfpenny upon which they pay interest. The result of this practice in endangering our monetary system we have just been dwelling upon; but there is another consequence, scarcely less disastrous—that is, the stimulus given by the banks to speculation in their desire to employ profitably all their deposits. The proper investment for a bank is in bills. If a bank discounts good bills, it knows exactly when each bill will fall due, and it therefore can so arrange its investments that day by day a portion of them will fall due; that at no time will too much of its money be locked up, or too much of it remain idle; but that each day a convenient amount will come into its hands. The number of bills offering for discount, however, is much smaller than the funds held by the banks. Partly owing to railways, steamships, and telegraphs, it is no longer necessary now for merchants to hold the immense stocks of commodities which it at one time was, and consequently they do not require so large capitals as they once did to do the same amount of business. In other words, a merchant's own capital goes much further now than it did formerly. Further, the low prices which have prevailed of late years enable the merchant's capital to go still further. And, lastly, the large profits which the prosperity of trade for the past thirty years has ensured have made our merchants wealthier than they formerly were. For all these reasons, merchants do not now require so much accommodation as they once did. At the same time the deposits have been steadily growing. The improvement in the condition of all classes of the people has enabled them to save more largely than they formerly did. Banking facilities are also taken advantage of more largely, and consequently deposits are growing while bills are becoming more scarce. Thus bankers find themselves unable to employ as large a proportion as they once did of their funds in the discounting of bills. They are driven, therefore, to find some other means of investment. One is in the purchase of good securities, such as Consols, United States bonds, Indian and Colonial securities, and the like. But investments of that kind can be carried only to a certain extent by a bank. As a kind of reserve, investment in Consols is not only useful, but necessary. But if a bank sinks a large proportion of its funds in such a form, it virtually ceases to be a bank. Besides, if all banks were to invest largely in these securities, they would drive up prices so high that the yield would be scarcely remunerative. The third mode of investment is that to which we have referred above—loans either "on call" or for very short periods to the bill-brokers; but here again the amount so disposable is very limited. There remains, therefore, but one other mode of employment, and that is by lending on the Stock Exchange; and of late years loans made to the

Stock Exchange by bankers have been growing larger and larger. Every one who has attended to the subject must be aware of the enormous rise in the prices of securities during the past two years. Indeed, for the greater part of that time it scarcely mattered in what securities one invested, for the price was sure to rise. Therefore, a speculator was able to buy almost at random, and after a while sell at a profit. The natural consequence was a rush of speculators of all kinds and classes, and both sexes, and very few of these speculators had the money wherewith to speculate. Their brokers borrowed from the banks in order to "carry over," as the phrase is, from account to account, the speculators paying or pocketing the "differences" as the case might be. As long as the speculators were able to pay the "differences," and prices continued to rise, all went merrily; but after a time the banks began to grow uneasy. They saw that prices had reached a level at which it was scarcely possible that they should long remain. They saw further that they had increased their loans so enormously that any accident might upset the market, and might place themselves in a serious dilemma. They grew apprehensive, therefore, and they began to make difficulties about fresh advances. Then they began to call in a portion of their loans, and ultimately they insisted that some of the accounts should be closed. In their turn, the brokers, finding themselves thus pressed, put pressure upon their clients, and where these were not able to pay for their purchases, they had to sell. Prices instantly began to fall, and there was a sort of crisis. Then, when prices had fallen far enough, and the greater part of the speculators were cleared out with heavy loss to themselves, the brokers paid off the greater part of the loans they had obtained from the banks, and the banks found themselves with idle money once more upon their hands. They began to think that possibly they had been too hasty after all. They had got back their money without loss, and they looked ruefully to the low interest with which they now had to content themselves instead of the handsome rates which they were lately getting. They were ready again to lend as before, to send up prices, and to stimulate speculation. And so this game of alternate rises and falls is promoted by the anxiety of the banks to employ their deposits profitably, and at the same time safely.

It is the fashion to talk of the Stock Exchange as little better than a place of gambling, and of stock-brokers as gamblers; but it will be seen that stock-brokers could gamble very little without the assistance of the banks, and that bankers really contribute quite as much to the gambling as the brokers, although bankers are ready enough to turn round when the crash comes and hold up their hands in horror at the wickedness perpetrated on the Stock Exchange. The banks first stimulate the speculation, and then bring on a collapse by precipitately calling in their loans. It may be said that the speculators deserve their fate; but the question of desert matters little if the final result is loss to the community, distress, discredit, and depression. It is much easier, however, to point out the mischief than to suggest a remedy. The original cause of the mischief, as we have already said, is that the banks, speaking generally, pay interest upon the deposits they receive, and consequently find it necessary to employ these deposits to the last halfpenny. But the deposits, it is to be remembered, really constitute the working capital of the banks. The so-called capital—that is, the capital subscribed by the shareholders—is a mere bagatelle compared with the enormous business which the banks do, and can be looked upon really only as a kind of insurance that, if anything goes wrong, there is a reserve to fall back upon. The real working capital consists of the deposits, and it is not reasonable to expect that the depositors should find capital for the banks and yet receive no share of the profits. As they share in the risk, they have undoubtedly a right to a share in the profits. And it is certain that, if they were refused their share, they would withdraw the deposits, and the banks would soon find themselves without the means of carrying on the large operations which they are now doing. No doubt, in many cases, this would be beneficial. Some of the great joint-stock banks have become overgrown, and would really be better and safer institutions if they had smaller deposits. Still they are not likely to think so themselves, and it is not probable that they will adopt any resolution with the result of causing deposits to be withdrawn. We fear, therefore, that we must accept as inevitable some kind of return to the depositors. But it may be worth while considering whether it would not be better to give them a share of some kind in the profits, rather than to pay a fixed sum beforehand. If their remuneration was to be dependent on the profits made, the business would be safer than it is at present, when the interest paid to the depositors is a first charge, and, in fact, is reckoned as part of the working expenses.

## REVIEWS.

### MATABELE LAND.\*

A PERUSAL of the notes, diary, and letters which make up the bulk of this work increases our regret for the premature death of the author. Had he lived to return to England there

\* *Matabele Land and the Victoria Falls: a Naturalist's Wanderings in the Interior of South Africa.* From the Letters and Journals of the late Frank Oates, F.R.G.S. Edited by C. G. Oates, B.A. London: C. Kegan Paul & Co. 1881.

would have been something for him to recast or to amplify, and we should have been told more about the Falls of the Zambesi River, a visit to which, after three unsuccessful attempts, cost Mr. Oates his life. The work has been edited by the brother of the deceased with care and judgment. The letters and the notes have been reproduced with some few omissions; a short connecting narrative has been added by the editor; there are several good maps; and the collections of skins, stuffed birds, &c., in the hands of experts, have been carefully arranged and classified, and placed in appendices which add about one hundred pages to the original text.

The late Frank Oates was evidently a naturalist from his earliest youth. Leeds, the place of his birth, from its proximity to heath and moorland, gave him the opportunity of studying the habits of English birds and beasts. He was saved from pedantry by a career at Christ Church Oxford, which, if not brilliant in the academical point of view, completed his education as a gentleman. He was evidently of a fearless and adventurous nature, and the whole tone of his diary and letters justifies the expressions in the memoir as to the brightness and candour of his nature. We cannot doubt that he possessed the qualities that enable men to get on with what Dr. Johnson called "savage men and savage manners"; and his temper seems to have been tolerably proof against those trials which the duplicity, laziness, and ingratitude of Kaffirs inevitably involved.

The whole period of the voyage and exploration is comprised indeed than two years. Frank Oates, with his brother, left England in March 1873, and died of fever on his return from the Victoria Falls on the 5th of February, 1875. He went from D'Urban through Natal and the Transvaal, till he reached the territories known as Bamangwato, Makalaka, and Matabele. He spent some time at Gubuleweyo, the capital of the latter kingdom, and made ineffectual attempts to reach the Victoria Falls from Inyati; but had to retrace his steps and take a line more to the north-west, which eventually led him to his destination. He passed through Pretoria, the capital of the Transvaal, a sketch of which gives us no very exalted idea of the city in point of populousness or beauty. The climate in the cold season was almost perfect; not so the inhabitants. The few English are briefly dismissed as "a bad lot." No one could afford to keep a conscience. There was not a book-shop in the place nor a single good building, and the writer could only compare it with a frontier town in America on the extreme edge of civilization.

A great deal of these remains consists of notices of the climate and the country; the heat and the flies; the bare scrub; the tracts desolated and burnt up; the "long backs of the bushless downs," to borrow an expression from Mr. Tennyson; the thin streams running through tracts of sand; and the difficulties, physical and social, of getting on to the wished-for goal. There are also incidents of sport and natural history; but there are no thrilling escapes from infuriated lions and elephants, and the savage rhinoceros found in other parts of Southern Africa is only once or twice mentioned. Mr. Oates shot and hunted occasionally to procure specimens and to supply his larder, but he was no butcher in sport. His objects were discovery, adventure, and science; and difficulties only gave a zest to his enjoyment, and were looked on as things to be fairly met and mastered. Readers will do well to bear in mind several local terms which constantly recur. To "inspan" and "outspan" are not unfamiliar, and mean to yoke and unyoke the oxen of the waggon before or after the *trek*. A "spruit" is a small stream. *Koppes* are ranges of hills of varying altitudes. To be "thrown out" at a native Court is to be ordered to be put to death. An *Induna* is a head personage amongst natives. A *knob-kerry* is a stick with a knob to it, and, as may be seen by the sketch at p. 95, an effective weapon in a skilful hand. *Mopani* trees resemble alders. A *lichter* means an open grassy space. "Stamped corn" is corn crushed and boiled with salt and fat, or butter, into the consistency of stiff rice-pudding—an excellent dish for a hungry traveller. *Biltong* is meat dried in the sun; and a "salted horse" does not mean, as might be hastily imagined, a dish fit for the Soci  s Hippophages of Paris, but an animal proof by experience against the return of a peculiar sickness, and therefore worth just four or five times its original price.

The traveller's comfort, so far as anything can be comfortable in the heat and annoyances of Southern Africa, consists in having a good waggon, horses, oxen, and attendants. Mr. Oates dwells on the value of the waggon, except in very hot weather, when it is intolerable. It is fairly proof against wet; there are canvas curtains all round with pockets; and the sleeping mattress is laid on the top of the chests and packages below. Each waggon required fourteen oxen, and there were ponies and horses to ride. There is constant mention of roads, which we take to be mere cart tracks, and there were trying passages of streams when the waggons stuck in ruts and sand. The drivers and oxen, however, appear to have effected miracles, though every now and then a pole called a *diisel-boom* broke, or a wheel came off, or the vehicle stuck in the middle of a stream where the water was breast high. Wet weather seems to have been worse than heat. Provisions and clothes were in danger of spoiling, and there was no moving till the rain ceased. The sight of grass and bush on fire was splendid, and slightly compensated for the subsequent *trekking* over black and dusty plains.

Mr. Oates's opinion of the natives was not favourable. The Kaffirs were haughty and aggressive to Englishmen, but were ruled by the King with a rod of iron. The sympathies of the author were with the Bushmen, generally considered a degraded

race. But they run and hunt capitially, and are good servants, though cruelly oppressed by Matabeles and Makalakas. Mr. Oates showed a perseverance amounting to chivalry in his endeavour to get possession of the remains of six Bushmen, ruthlessly massacred some time before his arrival. In this he was at last successful, and one of the appendices is a valuable paper by Professor Rolleston on the skulls of these unfortunate savages. Yet we confess to taking more pleasure in reading about the living than the dead; in a vigorous despot and his sister gorgeously appalled than in the skulls of fifty Bushmen. Mr. Oates was fortunate enough to be present at the Great Dance at Gubuleweyo, performed by warriors in celebration of their past exploits and the number of their slain enemies. The King was dressed in the skins of monkeys and a broad-brimmed black felt hat, and he carried an Elcho sword-bayonet—given him by the author—and a "knob-kerry" of rhinoceros horn. The warriors made a march past him, singing in chorus, and followed by young Kaffir women of magnificent proportions and shapes. But all these were cast into the shade by the King's sister—an enormously stout lady of a coppery hue, attired in gilded chains, bracelets of brass, a freemason's apron, and a black skirt of wrought ox-hide. For headdress she wore an elegant bouquet of artificial flowers; feathers out of the tail of the bee-eater, and a circular ornament of red clay. She made a pretence of dancing, but was evidently too fat to do much. The King, barring occasional fits of ill-temper, when he is thought likely "to kill a number of people," does not appear in a very odious light. He disbelieved in the prowess of the white man, whom he thought to be afraid of elephants, and he tried to overreach a trader named Fairbairn, in an exchange of elephants' teeth for a double-barrelled gun. The King and his subjects have a strange prejudice against eating fish, and the monarch was darker in hue than any one else. A boy who had told a downright lie would have been tortured to death by the King's orders, had not old John Lee interfered. This gentleman is a Dutch patriarch who lives in what, for South Africa, is a picturesque part of the country, with crags, greenward, and some fine timber. Lee thought locusts must be very nice to eat, as Kaffirs, game birds, and animals all ate them. This potentate lived in a big house, and his brother, his father-in-law, and his poor relatives had little huts near him, and were treated as serfs. He seems to have been a man of some influence and position, to be appealed to in difficulties or when natives attempted to cheat.

It is to be regretted, says the editor, that we have so little of the Falls, the main object of the expedition, when the author at last got there. It is true that most other travellers have visited this wonder in the dry season, when the volume of water is much reduced, and that Mr. Oates went there in the rains when the channel was full. We have, too, in illustration of the narrative, two sketches, one in chromo-lithograph, showing the rainbows that span the abyss. The river just above the Falls narrows from two miles to one, and it then descends into a deep narrow gorge not more than one hundred yards across. From this it escapes again "by a still narrower channel of from twenty to thirty yards in width," and then it leads a zigzag course for five miles more, when it finally flows away east. Livingstone has declared the height to be twice that of Niagara; but, owing to dense vegetation, it is difficult to get a good view of the whole scene. The spray is said to mount to six or eight hundred feet in height, and to be visible, as a cloud of vapour, twenty miles off. The roaring of the waters was heard by Chapman at fifteen miles distance; and, though there may be a slight tendency to exaggerate the features of a waterfall which is only accessible to a few determined travellers, there can be little doubt that the Zambesi at this point may be fairly ranked amongst the most stupendous sights of the world. We are compelled, however, to utter a serious warning to all future travellers against visiting this place at the season unluckily chosen by Mr. Oates. We are told in the journal that fever may be caught at any time; that it is bad in the rainy season, and worst of all at its close, when the superabundant moisture is drying up. Mr. Oates went in January, when the rains are heaviest. Now we take the African fever to be simply the malarious jungle fever of India, so common in parts of the Central Provinces, in the Morung of Purnea, and in the Terai of Rohilkund. There are ardent and weather-proof sportsmen in India; but no man with a year's experience would think of remaining in either of the above-mentioned hunting grounds after the first showers of the rainy season in May, while to go there in November, when the rains had just ceased, would be deemed an act of suicide. Travellers going to and from the hill stations of India make a point of passing through these deadly localities after sunrise and before sunset, and ordinary Hindus and Mahomedans can no more stand such a climate than Englishmen. Dr. Bradshaw doubtless showed all the skill and kindness in his power, and, we apprehend, plied the sufferer with large doses of quinine, though we are not told so; but every one of the party more or less suffered. The servants all fell ill. Mr. Stoffel Kennedy died about the same time of the same disease, and other victims are mentioned. A touching incident is recorded in connexion with the death of the author. One of his favourite pointers, "Ball," was missed after the survivors had buried their companion, and boys were sent to look for him. He was found patiently watching his master's grave, having gone back, it is calculated, some eighty miles, with this object. This faithful animal died in England on the fifth anniversary of his master's death, and he was followed by the other dog "Rock" three

weeks afterwards. "All this is simply and touchingly told; but we cannot avoid again insisting on the imprudence of a visit to the Falls at any time except in the dry and hot season. Defied or insulted Nature, as the historian Gibbon remarked long ago, is sure in the end "to vindicate her rights," and to punish those invaders who at the wrong seasons molest her ancient and solitary reign.

To zoologists and entomologists the appendices in this volume, with their minute and scientific classification, will have a value far surpassing the notices of sport and incidents of travel amongst strange tribes which make up the volume. But, in our eyes, the interest centres in the records and the character of the writer. Not only does he take us far away from any beaten track, but he impresses us by his modest, manly, and sensible tone, by his intelligent observation of new scenes, and by his treatment of natives, whom he was too sensible to credit with unlikely or imaginary virtues, and far too strong and merciful to ill-use.

#### BALFOUR'S EMBRYOLOGY.\*

MR. BALFOUR'S exhaustive and original treatise, on a comparatively unknown subject, is not merely an important contribution to our scientific knowledge, but a triumphant vindication of the value of English scientific training, and more especially of that generous recognition of natural science which for some years past has distinguished the University of Cambridge. This treatise may be described as a Cambridge book from first to last. It was at Cambridge that Mr. Balfour obtained a First Class in the Natural Sciences Tripos of 1873, followed by the Natural Science Fellowship at Trinity College in 1874; and it is at Cambridge that he has since pursued his riper researches, with the exception of those which, from the nature of the case, he was obliged to follow out at Naples. In these days no one can hope to make more than a portion of the field of science his own; and Mr. Balfour has from the first selected embryology as his own particular province. In 1874 he published *The Elements of Embryology*, Part I., in collaboration with Dr. M. Foster, and in 1878 *A Monograph on the Development of Elasmobranch Fishes*. The remarkable discoveries enunciated in the latter work—some of which had been already announced in papers contributed to scientific journals—excited much attention at the time; and the scientific world, both here and on the Continent, was moved to no slight astonishment when it became known that the author had not yet passed the age at which men are usually learners rather than teachers. But "on vieillit vite sur les champs de bataille"; and the work before us is a still more wonderful instance of a like precocity. Most men of science, we imagine, would be content if, towards the close of a long life, they could feel that such a work as this was even fairly on the way to completion; but when we reflect that the author cannot be more than thirty years of age, and that it has been produced among the incessant claims on time and thought which college and university work entails, our surprise is even greater than our admiration. The two volumes contain together 1147 closely printed pages, much of the matter being thrown into smaller type in order to enable beginners to go rapidly through the subject; and at the end of each volume an accurate bibliography is given, carefully classified. A work so voluminous, so difficult, and written in strictly technical language, must of necessity appeal to a very narrow circle of readers. In fact, it is so far in advance of the present state of science that much time must of necessity elapse before it can be thoroughly understood. We are glad, however, to find various indications that its value as a standard work is being already recognized. There has been but one opinion expressed about its merits by men of science in England; it has been favourably received in America; and we hear that it has been translated into German, and will probably soon be translated into French. It will be impossible for us to attempt a minute analysis of it. We can only describe the scheme which the author has proposed to himself, with his method of conducting the several steps of his investigations, and indicate some of his general conclusions.

Embryology, as Mr. Balfour understands it, is "a term employed to cover the anatomy and physiology of an organism during the whole period included between its first coming into being and its attainment of the adult state." The importance of studying individual organisms, and of comparing the results observed in one group with those observed in another, will be readily understood from the following passage:—

It has long been recognized that the embryos and larvae of the higher forms of each group pass, in the course of their development, through a series of stages in which they more or less completely resemble the lower forms of the group. This remarkable phenomenon receives its explanation on Mr. Darwin's theory of descent. There are, according to this theory, two guiding, and, in a certain sense, antagonistic principles which have rendered possible the present order of the organic world. These are known as the laws of heredity and variation. The first of these laws asserts that the characters of an organism at all stages of its existence are reproduced in its descendants at corresponding stages. The second of these laws asserts that offspring never exactly resemble their parents. By the common action of these two principles continuous variation from a parent type becomes a possibility, since every acquired variation has a tendency to be inherited.

The law of development above stated may be expressed in rather

different language, so as to mark its importance more distinctly. Each organism reproduces the variations inherited from all its ancestors at successive stages in its individual existence, which stages correspond with those at which the variations originally appeared in its ancestors. Each organism therefore might contain within itself a full record of its own origin, and, were heredity the only influence brought to bear upon it, it would be a comparatively easy task to discover the history of the race or group to which the individual organism belongs. Heredity, however, is only one of a series of influences of which development is the resultant; and in consequence the embryological record is usually both imperfect and misleading. It may be compared, as Mr. Balfour happily expresses it,

to an ancient manuscript with many of the sheets lost, others displaced, and with spurious passages interpolated by a later hand. The embryological record is almost always abbreviated in accordance with the tendency of nature (to be explained on the principle of survival of the fittest) to attain her ends by the easiest means. The time and sequence of the development of parts is often modified; and, finally, secondary structural features make their appearance to fit the embryo or larva for special conditions of existence. When the life-history of a form is fully known, the most difficult part of his task is still before the scientific embryologist. Like the scholar with his manuscript, the embryologist has, by a process of careful and critical examination, to determine where the gaps are present, to detect the later insertions, and to place in order what has been misplaced.

The recorded observations on these important points have, up to the present time, been scattered through a number of disconnected papers, the authors of which, with certain brilliant exceptions, have too frequently worked independently of their predecessors, and accumulated facts in a manner which has clogged the advances of science, rather than promoted it. Mr. Balfour has brought a rare critical faculty to bear upon this vast mass of literature, and indicated the direction which future researches should take. It has been his object to find:—1. Ancestral forms common to the whole of one of the larger groups (as, for instance, the invertebrata); 2. Any special larval form constantly reproduced in the development of the members of one or more groups; 3. How far such larval forms agree with living or fossil forms in the adult state; 4. How far organs found in the embryo disappear in the adult; 5. How far organs pass in the course of their development through a condition permanent in some lower form.

These investigations are succeeded by an account of the evolution of special organs. It will be readily conceded that if the difficulties which encumber the points here enumerated could be satisfactorily cleared up, the history of the whole group would become plain; and the same process having been repeated for all the groups into which the animal kingdom has been divided, we should have made some advance towards the solution of the larger problem of the common origin of all living things.

The first volume, which was published separately last year, commences with a general account of the Ovum (pp. 1–100). The remainder is devoted to the systematic embryology of the Invertebrata, or, as the author prefers to call them, the Metazoa, preceded by a few pages on the "germinal layers." Each group in succession is examined, the different stages through which the embryo passes are recounted, with the help of copious illustrations, either taken from the best authorities (references to which are always given) or from the author's own drawings; and at the end of each chapter a summary of the general results arrived at will be found. The subject-matter of most of this volume is of necessity in large measure derived from the labours of previous investigators, as the author is at pains to show by references and by a bibliography (which, by the way, does not aim at being exhaustive) at the end of each chapter; but it has been so rearranged, sorted, and winnowed as to become as good as new. Moreover, much original work will be found scattered through the volume or referred to in the notes. We would cite as particularly original and valuable the treatment of the Tracheata and the Crustacea; and the summary of the development of the whole group (p. 451), where it is shown that the former—centipedes, insects, and spiders—are derived from "a terrestrial Annelidan type," and the latter from an ancestor akin to the Phyllopora, small "Crustacea with the maximum number of segments and the least differentiation of the separate appendages." But we should be led into technicalities of too abstruse a nature if we pursued this subject any further; and we will therefore turn to the second volume. In this there is much more original work. Mr. Balfour tells us in the preface that his own investigations have covered the ground more completely than in the first volume; "a not inconsiderable portion of the facts recorded having been directly verified" by himself. The illustrations also, four hundred and twenty-nine in number, all admirably conceived and executed, have more frequently been drawn by himself. The whole work, therefore, bears the stamp of his own individuality impressed upon it more clearly than the former volume did; and shows how wide, and at the same time how minute, his researches have been. The volume opens with ten chapters on the developmental history of the Chordata. This group contains, according to Mr. Balfour's views—(1) The Cephalochorda, of which there is a single genus only, *Amphioxus*; (2) The Tunicates or Ascidians; (3) The Vertebrata. The first of these used to be regarded as a fish; and the second has been placed by zoologists in different positions among the Invertebrata. Recent microscopic researches, however, have revealed indications of vertebræ in both, by which this change of their position has been justified. We mention this as a typical instance of the importance of the bearing of Mr. Balfour's researches upon systematic zoology.

\* *A Treatise on Comparative Embryology*. By Francis M. Balfour, M.A., F.R.S., Fellow and Lecturer of Trinity College, Cambridge. 2 vols. London: Macmillan & Co. 1880–81.

The more internal characters, and especially embryological characters, are studied, the more certain becomes a revolution in our old notions of differences and affinities. These opening chapters are succeeded by three comparative chapters, completing the section of Systematic Embryology. The remaining chapters record the development of the organs, the skeleton, and the muscular system, and are perhaps the most thoroughly original of the whole work. It would be beside our purpose, however, to do more than mention them here. Nor can we do more than advise our biological readers to study for themselves the chapters on the development of fishes, birds, and reptiles, where they will find set forth in full the steps which have led the author to his general conclusions on the ancestral form of the Chordata—the part of the work which, as it includes the probable ancestor of man, is doubtless that which most readers will first turn to. In the first place, he concludes that in that form the mouth had a more or less suctorial character; that it was placed on the ventral surface of the body; and that it has only gradually been adapted to biting purposes, and carried forward to the front end of the head. Secondly, this primitive creature had a notochord as its sole axial skeleton; and, thirdly, numerous gill-slits. This form is still persistent in the little lancelet (*Amphioxus*) and in the Ascidiæ. Gradually gills were developed, together with a brain and organs of sense, and we get a form of which the lampreys give us some idea. The next step was the development of what are called "branchial bars," and the formation of the skeleton of the jaws. The nearest living representatives of this group are the sharks and rays, which still retain in the adult state the ventrally-placed mouth. The direct descendants of these, with perhaps the intervention of a hypothetical group called the Proto-ganoidæ, are the Ganoids—those remarkable armoured fishes which were evidently common at a former period of the world's history, and of which there are still a few degenerate survivors—and the Dipnoi, or mudfishes. These latter became in time the parents of the Amphibia, while the former developed into the bony fishes (Teleostei), and through them into the Reptiles and the Mammalia. We feel that we owe the author some apology for thus briefly indicating conclusions the value of which can only be fully appreciated by a painstaking study of his work, with the aid of a museum and a laboratory. We venture to hope, however, that our remarks may suggest this labour to some students. They will find themselves amply repaid.

It may be assumed that before long, so rapidly does science advance, a new edition of this book will become necessary. When this happens, we hope that Mr. Balfour may be induced to preface it by an historical introduction of which he gave a sketch in his elementary treatise, containing an account of the rise and progress of the science of embryology. We do not mention the absence of this as a defect; but its presence would be a valuable supplement to a work which is alike admirable in conception and in execution.

#### WORTHIES OF THE WORLD.\*

THE "Historical and Critical Sketches" which form this bulky volume have, as the preface informs us, already been published separately. "The gratifying success," writes Dr. Dulcken, the editor, "that has attended the publication of the separate biographies leaves no room to doubt that they will find acceptance in this their collective form." It is owing, we suppose, to this piecemeal issue that the sketches follow one another in so curious an order. We begin with Sir Walter Raleigh and Napoleon, and end with John Bright and Homer. Horatio Nelson comes between Martin Luther and Geoffrey Chaucer, while Julius Cæsar has on either side of him as supporters Sir Walter Scott and John Wesley. From Gustavus Adolphus we pass to Socrates, and from Socrates to Robert Bruce. The writers have endeavoured, we are told, "to concentrate as much information within the limits of each sketch as was compatible with clearness of description. *J'évite d'être (sic) long et je deviens obscur* was the caution given by Boileau to the cultivators of beauty," adds Dr. Dulcken. It is a pity that he does not go to the maxim as given by Horace. It would have saved him from showing his ignorance or carelessness of French accents. Such a trifling matter as this, however, is scarcely worthy of notice among the grave charges to which this book lies open. The editor himself, as we shall presently show, falls into the grossest blunders. One of his contributors, however, whose sketches bear the initials of S. I. A., goes beyond blunders, and is guilty of the most shameless literary larceny. Whether he stands alone in this among his fellow-contributors we do not know. It was enough for our purpose to examine one or two of the sketches somewhat carefully, and to pass over the rest in contempt. Has the law of copyright, we found ourselves asking, suddenly come to an end? or are the great publishers too good-natured, or perhaps too careless, to put it in force? This is not the first writer whom, in the last year or two, we have convicted of stealing wholesale from works the copyright of which has not yet expired. It is much to be wished that one of these shameless scribblers were brought before a court of law, and taught that an author and his publishers have rights which cannot be wantonly assailed. A stop might in that case be put to the issue

of these worthless books, in which some great writer's highly-finished labour is treated in much the same way as a chronometer is dealt with by a receiver of stolen goods. The beautiful workmanship is wantonly wasted, and by the utter sacrifice of what constituted its real value a little silver or gold is got out of the melting-pot.

The charge that we have brought against S. I. A. is already serious enough. But he has added to the offence, for he has artfully tried to hide it. As we shall presently prove beyond all manner of doubt, he has hoped to cast a veil over his pilferings by now and then openly avowing his obligations to the writer on whom he has preyed. He first of all appropriates wholesale a long passage, and then he tacks on to it a few lines which he places between quotation marks, and in which he owns the author. The ignorant or unwary reader would never for a moment guess that up to the place where these marks are given he had not been reading S. I. A.'s own words. It is on his sketch of William Pitt that we base this accusation. A considerable part of it is taken from Macaulay's contribution to the *Encyclopædia Britannica*. As this was written in the year 1859, the copyright has still many years to run. But even if it had expired, no justification could be found in that fact for the meanness and the impudence of a writer who tries to pass off as his own the polished eloquence of a great author. The opening passage of S. I. A.'s sketch is sufficient to establish the charges we bring against him. In a parallel column we give the passages in Macaulay on which the robbery has been committed:—

#### S. I. A.

The subject of the following memoir had a good start in life. He inherited a name which at the time of his birth was the most illustrious in the civilized world, and was pronounced by every Englishman with pride, and by every enemy of England with mingled admiration and terror. William Pitt the younger was born at Hayes, in Kent, on the 28th of May, 1759, and was the second son of Lord Chatham and of Lady Hester Grenville, Countess of Temple . . . . When only seven years of age, the interest he took in grave subjects, the ardour with which he pursued his studies, and the sense and vivacity of his remarks on books and events, amazed his parents and instructors.

A letter is extant in which Lady Chatham, a woman of considerable ability, remarked to her husband, that their youngest son at twelve had left far behind his elder brother who was fifteen. "The fineness," she wrote, "of William's mind makes him enjoy with the greatest pleasure what would be above the reach of any other creature of his small age."

At fourteen the lad was already a man so far as intellect was concerned. Hayley, who met him at Lynn during the summer of 1773, was amazed, delighted, and somewhat over-awed, by hearing wit and wisdom from so young a mouth. The poet afterwards regretted that his shyness had prevented him from submitting the plan of an extensive literary work which he was then meditating, to the judgment of the extraordinary boy. The boy indeed had already written a tragedy, bad, of course, but "not worse than the tragedies of Hayley." "This piece," Lord Macaulay tells us, "is still preserved at Chevening, and is in some respects highly curious."

It will be seen that S. I. A. has not strictly kept to Macaulay's language. The first sentence is, of course, his own. If he had confined himself to such statements as that William Pitt "had a good start in life," he would have merely made himself a fair butt for ridicule. He gives, however, avowedly some fifteen lines from Macaulay, of which we have thought it needful to quote only the first two, and so, as we have said, endeavours to pass off the remainder as his own. At the end of the quotation, he apparently returns to his own narrative; but he again pilfers Macaulay's article, here and there, making, as before, slight but foolish changes in the language. This trick he plays several times, frequently, but not always, marking his theft by following it up with an acknowledged quotation. As our readers will have noticed, he cannot even copy correctly. "Lady Hester Grenville, daughter of Hester, Countess Temple" has been changed by this blunderer into "Lady Hester Grenville, Countess of Temple," and Lyme becomes Lynn. As Lord Chatham had but two sons, Macaulay, of course, speaks of William Pitt as "their younger son." "Younger," S. I. A., in his ignorance of grammar, changes into "youngest." Simplicity seems to be no less offensive to him than correctness. "The lad was in intellect a man," Macaulay wrote. "The lad was already a man so far as intellect was concerned," writes the pilferer. In the description which he steals of Pitt's residence at Cambridge, he makes a change in one sentence which renders it absurd. Macaulay wrote, "At seventeen, he was admitted, after the had

#### MACAULAY.

William Pitt, the second son of William Pitt, Earl of Chatham, and of Lady Hester Grenville, daughter of Hester, Countess Temple, was born on the 28th May, 1759. The child inherited a name which, at the time of his birth, was the most illustrious in the civilized world, and was pronounced by every Englishman with pride, and by every enemy of England with mingled admiration and terror . . . . At seven, the interest which he took in grave subjects, the ardour with which he pursued his studies, and the sense and vivacity of his remarks on books and on events, amazed his parents and instructors . . . . A letter is extant in which Lady Chatham, a woman of considerable abilities, remarked to her lord that their younger son at twelve had left far behind him his elder brother, who was fifteen. "The fineness," she wrote, "of William's mind makes him enjoy with the greatest pleasure what would be above the reach of any other creature of his small age." At fourteen the lad was in intellect a man. Hayley, who met him in Lyme in the summer of 1773, was astonished, delighted, and somewhat overawed, by hearing wit and wisdom from so young a mouth. The poet, indeed, was afterwards sorry that his shyness had prevented him from submitting the plan of an extensive literary work, which he was then meditating, to the judgment of this extraordinary boy. The boy, indeed, had already written a tragedy, bad of course, but not worse than the tragedies of Hayley. This piece is still preserved at Chevening, and is in some respects highly curious.

\* *Worthies of the World: a Series of Historical and Critical Sketches of the Lives, Actions, and Characters of Great and Eminent Men of all Countries and Times.* Edited by H. W. Dulcken, Ph.D. London: Ward, Lock, & Co.

fashion of those times, by right of birth, without any examination, to the degree of Master of Arts." S. I. A. improves upon this clear statement after the following fashion:—"At seventeen he was admitted, after the pernicious practice of those times, to the degree of Master of Arts."

We will venture to trouble our readers with one more set of parallel passages, so that we may establish this writer's dishonesty beyond a shadow of doubt:—

S. I. A.

It was asserted in many after-dinner speeches, Grab (sic) Street elegies, and academic prize poems and prize declamations, that the great Minister died exclaiming "Oh my country!" This is a fable; but it is true that the last words which he uttered, while he knew what he said, were broken exclamations about the alarming state of public affairs.

A motion was made in the House of Commons that Pitt should be honoured with a public funeral and a monument. The motion was opposed by Fox in a speech which well deserves to be studied as a model of correct taste and good feeling. The task was the most invidious that ever an orator undertook; but it was performed with a humanity and delicacy which were warmly acknowledged by the mourning friends of the deceased.

S. I. A. carries his stealings still further without a word or a mark to show that the words are not his own. He does not even spare that noble passage in which our great historian tells how, as Wilberforce said, "the eagle face of Chatham from above seemed to look down with consternation into the dark house which was receiving all that remained of so much power and glory." Four lines later he is at his old subterfuge, and thus begins a new paragraph:—"Some of Pitt's admirers," remarks Lord Macaulay, "seemed to consider," &c. One improvement that S. I. A. has made on the language of the original is too admirable to be passed over in silence. A dead Prime Minister, he feels, must not be spoken of as "him who was gone," but as "the deceased." We may be thankful that he did not go a step further, and write "the mourning friends of the late lamented deceased." We are reminded of the correction that the Alderman proposed to make in the inscription that was to be placed on Pitt's statue in Guildhall, wherein it was stated that a man who had been Prime Minister of England during nearly twenty years died poor. The Alderman moved to strike out "poor" and write in its place "in reduced circumstances."

While we thus expose the dishonesty of a contributor, we must not pass over in silence the work of the editor. Many of the sketches are from his own pen. In all such collections as the one before us we are sure to find a life of Johnson. No task seems at first easier than to hash up Boswell, and yet there are few tasks in which a careless and ignorant workman more hopelessly brinks down. Dr. Dulcken shares the fate of many who have gone before him, and adds one more to the worthless abridgments of a great work. Not a few of the errors into which he falls have their source in the ostentation of learning. In a sketch it was needless to mention Johnson's godfather, Dr. Swinson, or his pupil Offley, or the bookseller Gardener, or Boerhaave, or Barrelier, or Lobo, or Lilliput, or Windham. If, however, they are introduced, some little regard should be paid to spelling, and they should not be printed Swinser, Offley, Gardner, Boerhave, Basietire, Lobe, Liliput, and Wyndham. Neither was it needful to make any mention of a grant that Bennet Langton's forefathers had received from an early king. But if Dr. Dulcken thinks it well to make now and then a display of his knowledge of history and of Boswell, he should at all events be careful how he copies. He says, "One of Langton's ancestors, as Johnson complacently remarked, received a grant from Edward III." In Boswell the passage stands thus:—"I have heard him say with pleasure, 'Langton, Sir, has a grant of free-warren from Henry the Second.'" Croker in a foot-note adds that Bishop Langton had had a similar grant from Edward the First. Dr. Dulcken apparently has combined the two accounts. He has been forced to choose between the two names; but, if he has ousted Henry, at all events he has added his "Second" to Edward's "First," and so has brought out as his result Edward the Third. In the account that he gives of Johnson's famous "frisk" with Langton and Beauclerk, when he had been wakened up at three in the morning by the loud knocking at his door, and had gone down armed with a poker in the belief that some ruffians were coming to attack him, our editor represents Johnson as saying, "What is it, you dogs?" What he really said was, "What, is it you, you dogs!" A few lines lower down Dr. Dulcken is likely to puzzle his readers. Johnson's "*un-idea'd girls*" becomes "*unideal girls*." He spoils Johnson's saying that "the full tide of human existence is at Charing Cross" by thus altering it:—"The high tide of life was found at Charing 'Cross." In recording Johnson's removal from the Temple to Johnson's Court he writes:—"To Boswell he has humorously described himself as 'Johnson of that ilk.' Where the humour is, and what is the meaning of 'that ilk,' Dr. Dulcken very clearly shows that he does not understand. For when he comes to Johnson's next change of residence he writes:—

MACAULAY.

It was asserted in many after-dinner speeches, Grab Street elegies, and academic prize poems and prize declamations, that the great minister died exclaiming, "Oh my country!" This is a fable; but it is true that the last words which he uttered, while he knew what he said, were broken exclamations about the alarming state of public affairs. . . . It was moved in the House of Commons that Pitt should be honoured with a public funeral and a monument. The motion was opposed by Fox in a speech which deserves to be studied as a model of good taste and good feeling. The task was the most invidious that ever an orator undertook; but it was performed with a humanity and delicacy which were warmly acknowledged by the mourning friends of him who was gone.

"Johnson's migrations were confined to a move from the south side of Fleet Street to the north, or from one court 'of that ilk' to another." *Ilk* he takes, we imagine, to be the Scotch for *Street*. He says that Boswell published his *Journal of a Tour to the Ilkbrides* a year or two after his return. Is he, then, so grossly ignorant as to dream that Boswell dared publish that work in Johnson's lifetime? It was written, as he ought to have known, in 1773, and was not published till 1785. He says that Johnson was much flattered in Scotland by the respect shown to him by Adam Smith. There is, indeed, a famous story handed down by Walter Scott of the meeting of these two men in Glasgow, according to which Johnson said to Smith "You lie," and Smith replied "You are a son of a—." "On such terms," adds Scott, "did these two great moralists meet and part, and such was the classical dialogue between two great teachers of philosophy." Unfortunately—or fortunately—Croker has shown that Smith was not in Glasgow at the time of Johnson's visit. It is, perhaps, some consolation, when such tales are spread abroad, to have Dr. Dulcken's assurance that "on this journey Johnson, on the whole, behaved very well." It is satisfactory also to know, on the same authority, that "Rasselas" has its undoubted value." That, by the way, is a great deal more than can be honestly said of these Sketches, unless from the point of view of a dealer in waste paper. In writing of the *Lives of the Poets* our editor in like manner boldly says, "It may be safely said that these lines (*sic*) will amply repay attentive and careful perusal." A strong suspicion has entered our mind that he is patronizing a work which he himself has never even so much as seen. He describes the *Lives* as "a series of short biographies," and he adds, "Here, as elsewhere, we wonder that a man who could do such great things should occasionally stoop to such little ones." Are the *Lives* of Cowley, Milton, Dryden, and Pope nothing better than "short biographies"? If these were little things to which Johnson had to stoop, the elevation at which he usually lived must have been wonderful indeed.

There are, indeed, "short biographies"—by the name of sketches they are sometimes known—which call for stooping as low down as the mire on the part of those who are to write them. Such "stoopers" as these have of late been far too commonly seen; but among them all no one has surpassed, or even rivalled in meanness, that contributor to the series before us whose articles bear the initials of S. I. A.

## MARTIN ON THE CHINESE.\*

WHEN we hear of a man living much beyond the usual span of human existence we naturally inquire, in the hope perhaps of being able to secure the same result, what were the habits, pursuits, and surroundings which so lengthened out his years. Possibly they may turn out to be of a kind so distasteful to us that we may prefer a probably shorter life enlivened by more congenial conditions. The Taoist philosophers of China succeeded in adding years to their age by abstracting their minds from every thought and sensation. The state of mind which could consider years so gained worth living is one that is only to be marvelled at. But as are the lives of men so are the lives of nations. The death-roll of empires is a long one, and is ever being added to. Kingdoms are constantly growing up, flourishing, decaying, and disappearing. If it were not so, the map-maker's occupation would be gone. As it is, his hands are always full.

Occasionally a nation far outlives its conquerors, and philosophers and statesmen turn to it when it is within their reach to try to discover the secret of its elixir of life. China is such a nation. For more than twenty centuries the form of government established by She Hwang-te has practically remained unaltered, and the frontiers of the empire since it attained its maturity have scarcely varied. Dynasties have been overthrown, and the country has been repeatedly overrun by conquering invaders, but there has been no real break in the continuity of empire. The successful usurper, whether native or foreign, no sooner ascends the throne than he accepts, as a matter of course, the title, honours, and functions of the Son of Heaven whom he has deposed. He

Assumes the god,

Afflicts to nod,

And seems to shake the spheres.

At the same time he humbly follows in the path of conduct laid down in the Nine Classics for Imperial rulers to walk in, and obeys to the letter the code of rites and ceremonies which was drawn up in the time of Solomon.

But what has given this continuous life to the Empire? Not dynastic succession; for that has been constantly and rudely broken. Not the perpetual rule of wise and virtuous sovereigns; for no greater tyrants, no more vicious *roués*, ever lived than some of the rulers who have sat on the throne of China. We must look elsewhere, therefore, for the secret of life possessed by the Empire, and in the pages of Dr. Martin's book a clue will be found to it. The primary burden of the papers which make up the volume before us is the system of education and the ends which it is made to accomplish. Under Dr. Martin's guidance we are able to inspect the hallowed precincts of the Han-jin Yuen, or "Imperial Academy," the headquarters of letters, and it is curious to observe what a shabby and dilapidated

\* *The Chinese; their Education, Philosophy, and Letters.* By W. A. P. Martin, M.D., President of the Tungwen College, Peking. London: Trübner & Co. 1881.

building is considered good enough to house the arcana of a system which supports so magnificent an institution as the Imperial throne of China. Almost under the shadow of the yellow-tiled roofs of the Imperial city stands a mean-looking building, with nothing observable to distinguish it from any of the numerous public offices of the capital:—

On entering the enclosure nothing meets the eye of one who is unable to read the inscriptions that would awaken the faintest suspicion of the importance of the place. A succession of open courts with broken pavements, and covered with rubbish; five low, shed-like structures, one story in height, that have the appearance of an empty barn; these flanked by a double series of humbler buildings, quite inferior to the stables of a well-conducted farmstead—some of the latter in ruins—and dust and decay everywhere. Such is the aspect presented by the chief seat of an institution which is justly regarded as among the glories of the Empire. A glance, however, at the inscriptions on the walls—some of them in Imperial autograph—warns the visitor that he is not treading on common ground.

Such, in outward appearance, is "one of the pivots of the Empire and the very centre of its literary activity." For twelve hundred years the small body of Han-lin scholars, who are the very incarnation of Chinese learning, have held their sessions undisturbed by dynastic revolutions or political outbreaks. No learned society in the world can compete with it in age or in its intense exclusiveness. No scholar, however powerful, and no mandarin, however high his post or full his purse, can hope to enter its portals unless he has won his way against all comers at the prescribed competitive examinations which alone serve as stepping-stones to it. And the competition is no mere form. The examinations being open to all, and forming as they do the only recognized channel to official rank, every man in the Empire who aspires to end his days as something more than a pobleian enters the lists.

At the first competition, which consists of five sessions separated by intervals of a few days each, and which is held annually in the chief city of each district, about two thousand candidates generally present themselves. Out of this number from twenty to eighty of the best are chosen, and on these are conferred the degree of *Siu-t'ai*, or "Budding Genius." Every third year the budding geniuses from every district in each province—and there may be seventy or eighty—go to the provincial capital to appear before an Imperial examiner as candidates for the next degree of *Kü jin*, or "Promoted Scholars." On this occasion five or six thousand competitors contest the honour of being the one in each hundred who, as the ripest scholar, is admitted to the further degree of *Kü jin*. In company with all those who have won similar honours in the capital of the eighteen provinces of the Empire, the successful *Kü jin* goes, in the succeeding spring, to Peking, where, if fortune attends him, he wins the distinction of becoming a *Tsin shi*, or "One ready for office." In agreement with this descriptive title the new *Tsin shi* may, if they please, ballot for the vacant junior mandarinate for which they have now shown themselves qualified, and from which they may rise by their own exertions to seats in the Grand Council of State, or to places in the Imperial Cabinet. But, if desirous of still further distinguishing themselves as scholars, and of obtaining the honour of places in the Imperial Academy, the "two or three hundred survivors of so many contests" present themselves at the Palace, where they are examined by the Emperor in person. Out of this number about twenty are chosen whose scholarship is the ripest, whose penmanship is the best, and whose literary style is the most perfect, and to these are given seats among the Immortals of the Han-lin. On one only of these twenty chosen out of the three hundred million inhabitants of the Empire, *la crème de la crème*, is conferred the signal title of *Chwang-yuen*, or model scholar of the Empire. Once in three years is this degree granted; and so supreme is the prize that provinces contend for it, and the birthplace of the victor becomes famous for ever. The instant that the Imperial award is given, heralds carry the news at express speed to the friends of the laureate:—

We have seen [says Dr. Martin] them enter a humble cottage, and amid the flaunting of banners and the blare of trumpets announce to its startled inmates that one of their relations had been crowned by the Emperor as laureate of the year. And so high was the estimation in which the people held the success of their fellow-townsmen that his wife was requested to visit the six gates of the city, and to scatter before each a handful of rice that the whole population might share in the good fortune of her household.

But the Han-lin, which, being thus constituted, is recognized as the highest literary assembly in the Empire, is no lotus-eating retreat. Its members are appointed the official poets and historians of the reigning dynasty, and every Imperial compilation undertaken is the work of these men. It was they who edited the famous dictionary of the language which added a lustre to the reign of K'ang-he (1661-1721), and who, at the bidding of the Emperor K'ien-lung (1755-1795), compiled the celebrated encyclopædia in five thousand and twenty volumes, one of the few existing copies of which is now in the library of the British Museum. To act as examiners at the competitive examinations and as Literary Chancellors in the provinces form part also of their duties, as well as composing prayers for the use of the Emperor on occasions, writing inscriptions for the temples of various divinities, in acknowledgment of services, and choosing honorific titles for members of the Imperial household.

Such are the means by which the Emperor secures the services of the most highly educated men in the country. The holders of hereditary titles are so few that their existence cannot be said to impair the assertion that the holders of official rank form the only

aristocracy in China. Unlike the aristocracy of other lands, this charmed circle is, according to law, only to be entered by winning distinction at the examinations; and as these are open to every man in the Empire, of whatever age and of whatever station in life, except the very outcasts, the highest prizes are as freely accessible to the peasant or shopman as to the sons of the loftiest dignitaries. There is thus being continually recruited a vast army of scholars whose tastes and interests are all on the side of the existing order of things, and whose abilities serve both to maintain it and to crown it with honour. China may thus be said to be a democratic empire, tempered by an aristocracy of talent. Unfortunately the literary fields in which alone the scholars are allowed to exercise their abilities are cramped and narrow, but for information on this point we must refer our readers to the work before us.

But Dr. Martin travels over other fields besides the education of the people. He writes of their religions, their philosophy, their system of alchemy, and their literature. On all these subjects he is worth listening to, though with regard to some he shows a disposition to accept too implicitly the opinions of Chinese writers, who, speaking generally, show an extraordinary want of that critical ability which would alone make their opinions valuable. They can split straws over infinitesimally small points, but they are quite unable to draw a just inference from a wide basis of facts. A curious instance of this mental infirmity is their unquestioning belief that all the knowledge and all the science they possess were initiated and worked out by Chinese in China. And yet they are quite unable to point to any growth in either the one or the other. Their earliest records represent their ancestors as knowing quite or nearly as much as the modern scholars of the Empire, and tradition does not preserve an instance of an inscription in hieroglyphics, at which stage, had writing been invented in China, the characters must have remained for many centuries. In keeping with this general idea it is customary to regard Taoism as indigenous to China, and Dr. Martin accepts without questioning the belief. But it is impossible to read the musings of the founder, Laou-tze, without perceiving that, directly or indirectly, he must have had access to the fountains of Indian philosophy. After all, however, the opportunities of making such willing concessions to Chinese prejudices are so few that they can scarcely be said to interfere with the undoubtedly great value of Dr. Martin's work.

#### JULIAN KARSLAKE'S SECRET.\*

GIVEN two blameless prigs, to show how they made themselves, with the purest intentions, completely miserable—this, we regret to say, is the problem of Mrs. Needell's novel, *Julian Karslake's Secret*. Books like this are really a kind of answer to the aspersions which the pessimist is wont to cast on human life. Existence, it seems, is naturally so well ordered that the truly virtuous can only make a failure of it by the most desperate endeavours, and by the aid of the most improbable circumstances and accomplices. Julian Karslake and Sybil, his wife, are as truly virtuous as any two puppets can possibly be. But, by the aid of entire lack of common sense, of a preposterous villain, a rowdy relation, and a dying mother, who binds Julian to vows impossible in themselves, and by their interpretation more preposterous still, Mrs. Needell's hero and heroine manage to involve themselves in a series of very pretty scrapes. We do not say that these scrapes will not interest the confirmed novel-reader, and are far from warning him or her not to venture on *Julian Karslake's Secret*. The misfortune of novelists is that, while they appeal to a class of readers who are nothing if not uncritical, their writings have to be judged by reviewers in whom criticism is as much a habit as a duty. Julian Karslake's troubles are quite intricate and exciting enough for the reader who abandons himself to the author's will, and may very probably be popular with the public of circulating libraries. But, when examined in cold blood, the plot of this story seems one of the most antiquated of the *fœciles* of fiction, while the characters are far from exciting affectionate interest.

When she is first introduced to us, it is true, Sybil Dorrimore seems worthy of sympathy. She is the eldest daughter, tutor, and protector of a motherless family. The father is the selfish and self-absorbed literary man of fiction. He is allowed by a friend to live rent-free in a decaying old manor-house, and his children struggle up as they can while he devotes himself to a great work. This great work is a translation of the *Iliad*, and we are not surprised to learn that, when Mr. Dorrimore published it, on the system of divided profits and losses, he had to pay a large publisher's bill. In addition to translating the *Iliad*, Mr. Dorrimore made his daughter an accomplished Greek scholar at the age of eighteen, and she bought the boots and shoes of the family with her literary earnings. Among Sybil's other works, the author mentions a translation of "fragments of the *Prometheus*." Besides being clever, Sybil is pretty, and a great contemner of curates. The first scene in the book, where Sybil and her dog are acting Old Mother Hubbard before a nursery audience, is very pleasantly drawn, and induced us to conceive hopes of the book which have been sadly disappointed. Though she scorns curates, Sybil unconsciously wins the heart of one who is beautiful and rich, has "a high-bred physique," and "a composed and dignified

\* *Julian Karslake's Secret*. By Mrs. John Hodder Needell. London: Smith, Elder, & Co.

sweetness of personal manifestation." This gracious being is Julian Karlake, who surprises Sybil by suddenly coming and proposing to marry her, though scarcely any acquaintance exists between them. This proposal is as agreeable to Mr. Dorrimore (for Karlake is rich and generous) as it is disagreeable to Sybil, and to a singularly bearish admirer of hers, one Mr. Helstone. This Helstone is a distant connexion of Sybil's by the mother's side, and, having known the girl in childhood, falls in love with her as a young woman. It is natural enough that a proud girl, who has lived a lonely and purely intellectual life, should dislike the abruptness of Karlake's proposal. If he admired her, why did he not gradually acquire her esteem by the arts of pleasing in which rich, clever, and accomplished curates are not unversed? This question the reader asks himself at once; the answer he is not likely to anticipate. Karlake had a rowdy brother Harry, who betted and gambled. Julian deemed that a man with a rowdy brother could not possibly ask a girl to share his blighted existence. If this impossible and absurd scruple were generally entertained, there would be no marriages in families which keep a scapegrace. Now this scapegrace was supposed to have been drowned at the time when Karlake spoke to Sybil. The wicked brother had also committed a forgery, but this did not come to Julian's knowledge till after he was engaged to Sybil. In spite of the efforts of Helstone to prevent the engagement, the pair were betrothed; for Julian gradually won Sybil's affection, and he not only aided her father, but saved one of her brothers from drowning, as it is the privilege and duty of a hero of fiction to do.

We have not yet arrived at the secret, which is first detected by the experienced novel-reader in the fifty-third page of the first volume. "'I am moderately rich,' said Julian, 'and free from all personal family ties,' his face clouded for a moment as with an involuntary reminiscence of pain." Somewhat later, Sybil goes up to London to buy her *trousseau*, which task seems to occupy her for an unnecessary time. The house of Helstone is thought peculiarly well fitted for her home, as Helstone hates and insults Julian, and has moreover not only a dowdy sister, but a homicidal and lunatic mother under her roof. The existence of the lunatic mother is kept as secret as possible. Her presence in the story does not seem in the least essential. Whenever the tale drags more than usual, the mother has a violent fit, and Helstone goes up and is half-strangled by his unfortunate parent. On one occasion he is rescued by Julian, who gets badly bitten on the left hand by the old lady. The course of love runs tolerably smoothly, though Sybil learns from Julian that he has a mystery connected with a brother. Presently Helstone detects Julian in very affectionate talk with a young lady and a small boy. The small boy has all the beauty and "highbred physique" of Julian, and is indubitably a young Karlake. The scene, craftily chosen, of this secret interview is among the antres vast and secluded recesses of the remote Crystal Palace. Novelists seem to think that people who wish to escape notice always resort to the unexplored wildernesses of the courts of the "palace made of windows." Helstone leaps to the natural conclusion that the lady is Karlake's victim, and the child his son. He threatens and insults Julian; he is always threatening and insulting that "passionless perfection," and then tells Sybil what he has seen. But she trusts her Karlake, the marriage is not interrupted, and Sybil is taken to "see as much of Southern Europe as wealth, culture, and devotion could procure."

This is perhaps the best place to explain why Sybil is so irritating. One or two of her speeches (she speaks "like a printed book") will make her irritating qualities manifest. Thus, when Karlake, before his engagement, hints that he hopes no other attachment comes between them, Sybil replies in this style:—

"I have loved many men from childhood upwards," she said, "with an ardour no living creature, I think, will ever excite in my mind: they have been heroes, saints, philosophers even: Pericles, Cæsar, Marcus Aurelius in the old times; and in the present,—I am not sure it would be wise to tell you the names of those who stir my enthusiasm most."

Again, after her marriage her husband asks her if she will oblige him by going to church. As he is a clergyman, and it is his own church he wants her to attend, she replies thus:—

"Yes, because it would be an act of discourtesy towards my husband if I did not; but I think I shall ask you to accept it as a proof of my wifely devotion. You know how I have been brought up, how little I have been used to Church-going, and, to be quite frank, I feel no sense of deprivation in the past or of gain in the present. Sometimes"—with a radiant smile—"if my mind is very weary, or again if it be very full, say, there is a new poem of Browning's to read or a novel of George Eliot's, I am afraid I shall beg you to let me off."

Probably the candid reader will now admit that Sybil is that most annoying creature, an "advanced" young lady freethinker. But Sybil was not long to occupy her Sunday mornings in peace and happiness with *Fyfine at the Fair* and *Theophrastus Such*. The wicked Helstone tracked Karlake to the house where the young woman of the Crystal Palace adventure was living, and where her child was ill. He detected Karlake ministering to their necessities, and dared him to deny that he was the woman's lover and the father of the child. The real father, as every reader perceives, is the rowdy brother, who, after adding a cypher to the cheque of a vindictive Scotsman, had fled across sea, had been wrecked, and finally had turned up very inconveniently in London. But why did Julian go on suffering for his brother's sins, and bearing the burden of his misdeeds? Because he had taken an oath to a dying mother. The oath is thus described:—

"You will never forsake Harry," she had faltered, as the pale, stricken

lad knelt by her side to receive her last commands: "he is so much younger and tenderer than you. Promise me you will always stand by him as long as you live, and will help him, even at any cost to yourself." The oath, as again described, was to the effect that Julian "would secure Harry's welfare in preference to his own." We have first to imagine a mother who would exact so absurd a promise, then to believe in a son who would bind himself thus, and, finally, to imagine that Julian would so interpret his oath as to refuse to disclose the fact of Harry's existence. He actually carries this theory of his duty so far as to lie deliberately when he is asked if he has a brother. The only sensible person in the tale, the vindictive Scotsman whom Harry has defrauded, says, with truth:—

"What is the meaning of this farce? You suffer a girl like your wife to listen to such taunts, know yourself accredited with the parentage of Nell Trevelyan's child, flouted with its monstrous likeness to yourself, and do not speak the one word that would clear you! By God, you deserve to be left struggling in the mire!"

These remarks of Mr. Austruther are the best and briefest criticism on the conduct of Mrs. Needell's hero and on the character of her plot.

If Julian is the martyr of a morbid spirit of self-sacrifice, which spares no one who is innocent that he can possibly involve in trouble, his wife may be said to equal him in ingenious perversity. Helstone threatens, as an "aggrieved parishioner," to bring Julian's conduct before the Vestry. The parish Vestry seems an ill-chosen tribunal; but Julian and his wife both actually visit Helstone, and implore him not to carry out his threat. At last Sybil, in Julian's absence, makes an arrangement with Helstone. She is to run away, and stay away from her husband, and Helstone is to refrain from dragging Julian before the Vestry. Sybil therefore flees to the Waterloo Station, takes a ticket to Esher, and there is hospitably received by a kind old lady, who drinks tea out of old Chelsea cups. This is just the refuge for Sybil, who had been in the habit of nursing a "perfect bronze" and "priceless bit of old china." In the remote and untrodden wastes of Esher Sybil long remains concealed. To run away from a husband is not the best method of concealing him from shame and scandal, nor does Sybil's manoeuvre produce this result. The later machinations of Helstone, and the conclusion of this strange, eventful history, may be discovered by the curious in the last volume of Mrs. Needell's romance. Helstone is left expressing his hope of yet becoming a friend of Julian's; and, so utter a prig is Julian, that very probably he deemed it his duty to forgive and cherish his clumsy and blackguardly persecutor.

If *Julian Karlake's Secret* be a first novel, there is no reason why its author should despair of producing much better work. The style, though somewhat stiff, is correct; and the earlier chapters show considerable power of setting a situation before the reader. But there is at present no indication of ability to devise and carry out a complicated plot; and it is probable that Mrs. Needell would succeed better in a less ambitious effort.

#### MADAME J— ON THE FRENCH REVOLUTION.\*

THE book of which this is a translation appeared a few months ago in France, and was then noticed in our French Literature columns. It was published by M. Lockroy avowedly as a political pamphlet in order to do justice to "a party which has been systematically calumniated." The writer was, it seems, M. Lockroy's grandmother; and this being the case, one does not quite see why the thin disguise of initials should have been kept up, especially as quite sufficient indications are given to enable any one with a little trouble to identify the persons concerned. However, that is M. Lockroy's business. We are quite ready to accept his statement of the facts, and we only wish that he had been a little more liberal of information as to the subsequent history of the personages introduced. Mme. J—, it seems, was the wife of a man of some property in an out-of-the-way part of Dauphiné, not far from the town of Romans, which is best known nowadays as having not long ago been the scene of one of M. Gambetta's most famous speeches. The whole family seems to have at once thrown in its lot with the Revolution, and the husband was not only named "Deputy Supplementary" to the Legislative Assembly, but was subsequently a full-fledged member of the Convention. The eldest son was for a considerable time absent in England, and afterwards had a Government mission to Toulouse, while M. J—, during the period of his "supplementary" deputyship, had to live at Romans. The mother of the family, however, resided in Paris during the most stirring times of the pre-Thermidorian period, and wrote frequently to her husband and her son. It is these letters which M. Lockroy has published, with a very few of earlier date, depicting pleasantly enough the experiences of country life. His object is to show that "the same process took place in the minds" of Mme. J— and of the nation, that "the irresistible logic of facts brought her to the Republic," and that "her patriotism impelled her into the ranks of the Jacobin party." M. Lockroy insists (quite rightly) on the fact that these letters are obviously unstudied and purely private; and, holding up his grandmother as a type of an ordinary woman of good education and intellect, full of family affection, and quite free from any motives of

\* *Letters of Madame J— on the French Revolution*. Edited by Edouard Lockroy. Translated from the French by Miss Martin and an American Collaborator. London: Sampson Low & Co.

ambition, greed, or the like, he asks us to take this testimony in favour of a calumniated party. The challenge is fair; and now that it has by the fact of translation been definitely put to Englishmen, it is time to take it up.

Almost at the outset of the book we come across passages which make us doubt whether the distance "between Mme. J——'s starting-point and her conclusions" was quite so great as M. Lockroy would have us think. She tells us frequently that the Abbé Mably was a friend of the family, and every one who knows anything of the history of the French Revolution knows how disastrously it was influenced by Mably's Græco-Roman, or rather pseudo-Græco-Roman, Republicanism. Her son, a boy of ten years old, is entreated to "remember Epaminondas and Coriolanus, who took a double pleasure in doing right, from the sense of the joy they gave their good mothers." There is no harm in this, though it shows that Mme. J—— had not the least notion of Coriolanus, and that she had imbibed the ridiculous Brutus-and-Hammodius jargon which was answerable for so much. This was four years before the Revolution. The next letter dates from '89 itself. The mother writes to her small boy, "Our courageous representatives, after having braved the thunderbolts of despotism," &c. &c. This may seem to M. Lockroy the attitude and language of the average sensible woman, undecieved by phrases, and prepared to be a trustworthy witness; it does not seem so to us. Two years later (for the early letters are few and far between) she pities her husband for his stay among "that hateful lot of aristocrats"; and immediately afterwards a still more instructive sentence occurs, which is at once a confession and a symptom. "Remember," she says to her son, "that among the twenty-five millions who people this great realm of France there is hardly one in a hundred who has raised himself to the height of the Revolution, or who understands all that your fresh and energetic mind conceives so easily, like those valiant Romans with whom your studies have made you intimate." This paragon of the twenty-five millions of France was, let it be remembered, a boy of sixteen, and he had, according to his mother, put himself into a position to judge the state of a complex modern civilization by studying valiant Romans. It is not wonderful, after these maternal encouragements to priggishness, that we come across a letter expostulating with the young man for taking his parents to task as to their manner of educating him. When a young gentleman of sixteen has been told that his intellectual condition is superior to that of twenty-four million seven hundred and fifty thousand of his countrymen, he may not unreasonably presume. Not long afterwards Mme. J—— remarks that "the insolence of the aristocrats must have angered the Supreme Being." "The nobles are monstrously wicked." "Devils of every hue are arriving in Paris from all parts of the country." Yet, again, she knows that "the story of Chabot Carn, &c., has defeated a barbarous plot which was on the point of being put into execution. . . . The stupid crowd asks for material proofs," and she admits that there is nothing but "moral certainty, because all evil geniuses are prudent and clever enough to conceal their crimes in secret." "Food has doubled in price; every means is used to weary and exhaust the people." She is unhappy about her son. "The gloomy temperament of the English people augments his natural disposition to melancholy; and royal despotism, which in England exercises all its tyranny under the name of liberty, grieves him almost to the point of despair." A petition adverse to Mme. J——'s views is presented; "it was received with the contempt it deserved, and the indignant Assembly closed the sitting." The entrance to the Louvre is forced. "Some stupid coarse expressions were uttered, no doubt by enemies of the people, at the moment when entrance to the den was gained." "We are," she says, "as firm as the Alps, as lofty as the cedars of Lebanon, and as calm as the still waters of a lake." "There are three federalists staying at ——. These three men of liberty have an air as proud and austere as her own." D'Aprémouil is mobbed by some calm and lofty patriots. All Mme. J—— has to say is to record the fact; "he had the audacity to preach the counter revolution." One of the numerous and propitious canards of the time has been set afloat. "A frightful event has again excited our indignation. Our volunteers at the camp at Soissons have been poisoned by powdered glass being put in their bread. The report of the Commissioners sent by the Assembly seems to indicate that it was due to carelessness, but that deceives no one." The 10th of August comes. To do Mme. J—— justice, she seems a little uncomfortable, but she discovers the happy phrase, "There have been some popular executions which prove that the lion is roused." Shortly afterwards, when the pikes had hardly been cleansed of their goblets of Swiss flesh, she remarks, "the people demand justice. . . . How gay and good-humoured the French are!" It is, indeed, confessed in a day or two that "poor petty creatures who can only understand partial justice are revolted at the horror of a head on a pike." But then Mme. J—— is not a poor petty creature. This is followed up by a casual reference to "the idiotic toleration of superficial minds." The 2nd of September staggers her for a moment, but only for a moment. "The discovery of the most infernal machinations does away with regret, for if the people had not purged the earth of the villains who were in the prisons, they would have saturated it with the blood of the people." A vigorous company of villains truly—some hundreds of bloodthirsty old men, young women, and priests against Paris. Soon after the weathercock changes. The Girondists, and especially Pétion, have been the writer's idols. Now they are "incredibly wicked." A little later Mme. J—— informs her son Jules that, if a plan of his had been

adopted, "if the executive power had executed that well-devised system of enlightening the English people, George and Pitt would have wasted their time and money." The letters end abruptly, and all we know is that the gifted Jules, aged eighteen, was arrested after Thermidor. We hope he was not guillotined; but, if he was, it would be interesting to know whether his mother retained her opinion of the good-humoured gaiety of the French people and the sublime attributes of the Revolution.

We have adopted this laborious and not particularly elegant plan of stringing together the most pertinent expressions of Mme. J——'s opinion in the very words of the writer, because it seems to us that in no other way can the reader be put in a position to decide M. Lockroy's problem. Is Mme. J—— a "woman of superior mind," who singles out with clear-sighted patriotism the "only men who were strong and bold enough to protect the democracy and France"; or is she a doubtless well-meaning and domestically affectionate person, who has been initiated early into a bombastic habit of speech and a confused habit of thought, who follows in a docile manner the political opinions of those whom she loves, who accepts the most absurd hoaxes with implicit faith, who believes her own family to be the best and cleverest people in the world, and who is comparatively indifferent to any suffering which does not directly concern that family? We have given a plentiful *corpus* of evidence on which to decide the question, and, for our part, we have not much doubt what the verdict of reasonable people must be. It is, we think, a matter of some congratulation that the book has been published, and of more that it has been translated, for it forms an admirable commentary on the theory, now often put forward, that the traditional detestation in which the Revolution has been held is folly; that not only was the blood which flowed not so very pure, but that very little of it flowed at all; and that, so far from this triumph of unbridled democracy being an argument against that form of government, it is a testimonial in its favour. M. Taine has attracted the wrath of critics of this kidney, because he has chosen once more to set forth the facts, and it is not impossibly the damaging effect of his volumes which has stirred M. Lockroy up to the publishing of this book. Also, he is most assuredly hoist with his own petard. We may even grant him his thesis as to his grandmother's natural qualities for his more effectual confusion. What sort of principles must they be which make a well-educated and superior woman of quick affections indulge in rant of which a schoolboy might be ashamed, swallow fictions and fallacies which ought not to deceive an infant in arms, and palliate the nameless outrages of the 10th of August and the 2nd of September?

It may be added that the interest of the book is, with very few exceptions, entirely historical and political. It is, on the whole, fairly translated, though there are one or two blunders of rendering, and though the proper names throughout are printed with a good deal of carelessness.

#### SCOTT ON ENGLISH CHURCH ARCHITECTURE.\*

THE architecture of churches considered in direct relation to the uses for which they are built—or, to adopt the compendious modern term, ecclesiology—is a branch of study which has taken shape over Europe within the lifetime of the actual generation, while the headquarters of this suddenly popular science are found in England. The years which have elapsed since the days of Britton, of Pugin, of Willis, and of the Cambridge Camden Society have built up enormous piles of information, comprised in libraries of publications of all sizes, from the folio to the leaflet. The time had already come for condensing the stores so redundantly provided by these diversified authorities into some compendious treatise of an encyclopedic kind, of larger bulk and more pretension than Mr. Parker's Manual, or the almost forgotten *Handbook of English Ecclesiology* put out by the Cambridge Society. In other words, some one was wanted to do for England that which M. Viollet-le-Duc had performed for France, while avoiding the perverse eccentricity which induced the French antiquary to cast his materials in the unscientific and cumbersome shape of dictionaries.

Our thanks are accordingly due to Mr. G. G. Scott for having, cradled as he has been among Gothic churches, given proof of his training, and come forward to utilize the vast store of information which had grown up in his own and his father's hands, in an *Essay on the History of English Church Architecture prior to the Separation of England from the Roman Obedience*, an expression which plainly shows where the writer's own obedience now is centred.

Mr. Scott, in view of the wide field of enterprise which he had mapped out for himself and his performance, modestly apologizes for his "little work" as "somewhat unmethodical and even desultory—a collection of papers rather than an essay." When a writer comes forward to forestall his critics' less favourable judgment, criticism is perforce disarmed; so we shall only remark upon this confession that we can hardly accept the epithet "little" in relation to a quarto closely printed, mostly in double columns and with numerous notes in very small type, besides being rich with copious illustrations, in plans and perspectives, although conspicuously destitute of elevations. The body of the

\* *An Essay on the History of English Church Architecture prior to the Separation of England from the Roman Obedience.* By George Gilbert Scott, F.S.A. London: Simpkin, Marshall, & Co. 1881.

work consists of five chapters—namely, 1, the general history of ecclesiastical architecture previously to the conversion of the English; 2, from the Mission of St. Augustine to the Norman Conquest; 3, the Norman period; 4, from the first appearance of the Pointed style to the commencement of the fourteenth century; and, 5, from the fourteenth century to the close of the Mediæval period. There are, moreover, separate essays interspersed between the chapters, on the Orientation of the Early Christian Churches; on the Artistic and Aesthetic Elements in Primitive Christianity; on Early Churches in Eastern and Western Christendom; the Ornamentation of the Basilica of St. Felix at Nola (contributed by that erudite antiquary Mr. R. O. Jenkins, of Lyminge); Vitruvius on the Secular Roman Basilica; the History of the Casula (or Ohsauble); the Painted Ceilings of St. Albans Abbey; on certain Mediæval Innovations in the Distribution of Churches; and, finally, Notes and Remarks upon the Illustrations. The result of this somewhat complicated scheme of composition is that we have a book which is more than a history of English, and yet less than a history of cosmopolitan, church architecture. We fear that, with all Mr. Scott's industry, and in spite of the great mass of curious materials which he has brought together, the anomalous and rather perplexing method of his volume will tell against its taking the place among standard works of reference which in some respects it might have claimed; but we trust that its author has really intended it only to be a pilot balloon for that general history of ecclesiology towards which it is so considerable a contribution. For such a larger treatise all its contents are, in different degrees, available, while its reduction within the promise of its title-page would lead to huge excisions.

We are sorry to say that, in reference to the purely English portion of the volume, we have a grave remonstrance to offer. The title, several times repeated through the volume, is *The History of English Church Architecture*, with no explanation or limitation of that expression. Yet in an overwhelming preponderance through the text—and absolutely without a single exception in the illustrations, be they plans or perspectives—that which is presented to us is a series of examples of English cathedral, monastic, and collegiate church architecture. Any one who will take the trouble of thinking how numerous, how various, how historically interesting, and in their larger and more costly specimens how architecturally valuable and how artistically magnificent, are our old parish churches, will understand that such a selection can offer but a one-sided exhibition of the ecclesiastical treasures of mediæval England.

It is curious, considering how thoroughly his sympathies are concentrated upon the Church before the Reformation, that Mr. Scott should have chosen, by way of frontispiece, to give us the representation of a monument which has recently acquired historical value as fixing the character of the ceremonial revival of the seventeenth century. No doubt the extreme beauty of the Cistercian minster church of Abbey Dore in Herefordshire, built in the thirteenth century, would plead for its filling a place of honour in any collection of architectural designs. But that which first catches the eye in this representation of its east end is its long stone altar raised on a footpace which is no longer than the slab itself, so that the celebrant must perforce stand in front of it. It is on record that the church was restored and this altar put up in the reign of Charles I. by a magnificent and well-known Churchman, Lord Scudamore; while the service drawn up for its consecration by the diocesan, Bishop Wren, and for the first time published a few years ago by Mr. Fuller Russell, embodies a ritual more calculated, according to the notions of the Church Association, to land its author in that prison which was, after all, Bishop Wren's fate for eighteen years, than upon a Bishop's throne. The altar and the consecration service at Abbey Dore are a startling refutation of the plunging efforts of such controversialists as the Dean of Chester to get rid of the light which the practice of Churchmen such as Wren and Cosin throws upon their reading of the Prayer-Book and its ritual.

Mr. Scott has been misinformed in the statement which he makes that, till some forty years ago, the so-called "patriarchal chair" at Canterbury occupied its primitive place behind the high altar, and facing westward, and that at this date "Archbishop Howley abandoned this relic of primitive custom, and modestly withdrew his throne from a position of dignity, felt, perhaps, to be unreal, to a more humble situation in the choir." About the date named, the Italian altar screen and throne, with which the eighteenth century had burdened Canterbury Cathedral, made way for successors in that which the uneducated fancy of the then Cathedral surveyor believed to be Gothic; but no further contempt than that of continuous neglect was then shown to the ancient Cathedra, which had for years out of mind been banished to that transept in which it is still found. Referring to the Saxon Cathedral of Canterbury (of which he republishes Professor Willis's plan), which we know to have been a specimen of that curious arrangement still to be found in some German churches—the Metropolitan Cathedral of Mainz, for instance—by which an apse and an altar were provided at either end, Mr. Scott conjectures that these buildings must originally have been basilicas, with the altar (as in those at Rome) at the west end, the celebrant looking eastward, and that the apse at the other end was added for the use of the monastic body. The question is too extensive for us to adventure its discussion, nor can we enter into the other matters of ecclesiastical controversy which are raised in various parts of the volume.

## THE VICAR'S PEOPLE.\*

IT is about two years since *The Parson o' Dumford* was reviewed in these columns; and a new novel by the same author comes into our hands without any of the suggestions of weariness in the reading, or of inanity in the contents, which too commonly are associated with modern fiction. In the former novel the centre of action, as well as the main interest of the story, was found in the "Parson" himself; and it may have been by way of contrast that Mr. Manville Fenn has assigned to his later work its somewhat misleading title, which to ordinary readers of publishers' notices may indicate either an ecclesiastical novel with a purpose or a social picture having some clerical domestic interior as its scene. *The Vicar's People* is nothing of either kind; it is a story where the interest centres entirely in the people, and in which the Vicar takes a subordinate and almost feeble part. He is a kindly and well-meaning man, but without the force of character which gave "the Parson o' Dumford" influence with his parishioners; and it is in the young engineer, Geoffrey Trethick, that the counterpart of the Rev. Murray Selwood of Dumford is to be found among "the Vicar's people."

The scene is laid in a Cornish mining district on the coast; and the "people" are occupied in some proportion as miners, but for the most part as fishermen. The mines of the neighbourhood have long been known to the promoters of Companies, and of some of them the names and fortunes are associated with the chequered histories of the Stock Exchange. A writer of fiction who places himself amidst these circumstances must be either very reckless or very careful. He has to steer between the Scylla of engineering and the Charybdis of finance—under the possible, if rather Hibernian, contingency of being swallowed up in both. But Mr. Manville Fenn has not been trained in the school of authors whose full moons are seen from Welsh mountains rising over the Irish Sea; and, either from intimate local knowledge or from careful study, he has succeeded in presenting to his readers a series of pictures which convey an impression of entire accuracy in detail, whether as regards the dialect and vocabulary of the Cornish coastfolk, the technical processes of mining, or the relations of "adventurers" alike to brokers in the City and to bankers in the West.

The second title of *The Vicar's People* is a summary of the whole "story" of the work. It is "the Story of a Stain," and this forms the dark thread connecting the various and powerful delineations of character and the succession of dramatic situations and incidents which, rather than any development of plot, attract the attention of the reader. The "stain" itself is of a nature which will be readily imagined; and the author, in working out both the main and the subordinate outlines of the story, would seem to have been as studious in the invention of paradox as he has been careful to avoid mistakes in construction. We are not by the paradoxical in almost every shape which the structure of a novel allows; and, whether the paradox be in its character physical, moral, or artistic, we may feel tolerably certain that it has been introduced of deliberate purpose, and not by any oversight of the writer. Among the questions of this kind which Mr. Fenn presents—challenging the immediate doubt whether the situations are possible or are within the limits of allowable fiction—we are not disposed to offer any definite opinion on those which are physical in their character. Of these, the most conspicuous, and, as to incident, the most elaborately and strikingly drawn, is the escape of Bess Prowle, the smuggler's daughter, from the mine down the shaft of which she—the wrong victim—had been thrown. To the reader, as to the baffled contriver of the crime, the conditions of the fall must preclude all thought of escape from instant death; but the author follows the intricacies of mining passages as one who is familiar with them, and, granting the assumed combination of nerve, bodily vigour, and mental resource in the girl, we cannot pronounce the description impossible. By an ingenious method, introduced in connexion with another portion of the story, Mr. Fenn had already carried his readers along the strange subterranean adit or passage from the shore by which the outlet for the escape of overflow water from the mine could be reached. A second physical difficulty must be left to the criticism of medical readers. It is convenient for the purposes of the story that Geoffrey Trethick should for the time lose his reputation in more ways than one, and that he should appear to his neighbours to be a drunkard as well as a profligate. This result is brought about by means of drugged liquor accidentally taken, and prepared, not for him, but for the two night-watchers at his mining engine, upon whom it had produced the intended effect of sending them into a deep and immediate sleep. Geoffrey, exhausted by watching and anxiety after the ruin of his mine, "had partaken of a terribly strong dose in the dregs of the bottle, where the drug had settled down"; but in his case, before he becomes insensible, and apparently helplessly drunk, there is a considerable interval, in which he is able to pay a visit to Mr. Penwynn the banker, and in his and his daughter's presence to fall into the unsteady condition of ordinary intoxication, which comes upon him unexpectedly. In this case some incongruity appears at first sight between the cause and the effect.

The Wheal Carnac mine had been flooded by a disreputable miner named Lannoe, on the instigation of one Tregeenna, a lawyer,

\* *The Vicar's People: a Story of a Stain.* By George Manville Fenn, Author of "*The Parson o' Dumford*." 3 vols. London: Chapman & Hall (Limited). 1881.

and the villain of the book. Tregenna is drowned in attempting to escape from arrest on a charge of murder; and the wreck, from which the fishermen are saved, is seen from the shore. The scene is well described upon the ordinary lines of fiction; but the death of Lannoe the minor is an illustration of the artistic paradox to which we have already referred. This part of Mr. Fenn's work may be said to correspond with the representation in a picture of a vessel going down with all hands in the open sea, without land or a sail in sight—a case of which the conditions preclude the possibility of any picture having been drawn. Lannoe has gone down into the mine for the purpose of making a breach on the sea side, by blasting with a cartridge and long fuse. All his proceedings are described in detail till he gives with his pickaxe a blow to fix the cartridge, which he believes to contain gunpowder only, in its place. The cartridge is, however, of dynamite, and Lannoe is killed by the explosion at the same moment that the water rushes in.

But it is upon the moral paradox involved in the main action of the story that Mr. Manville Fenn's critics will probably have most to say. We do not go so far as to pronounce the course which he has marked out for his hero impossible; but in a man situated as Geoffrey Trethick was at the time we must regard it as extremely unlikely, while it was not a course which in honour or in conscience he could have been in any way bound to adopt. He had rescued Madge Mullion, the vain and weak daughter of his landlady, from the death which she sought for the sake of concealing the "stain," and he had carried her to the cottage of old Prawle, the fisherman and smuggler, on the shore, where he had for some time been on a footing of intimacy. As the story of Madge became known, suspicion had fallen on Geoffrey, and his Cornish friends began either to look coldly on him or to cut him altogether. The suspicion was groundless, and the true direction in which the eyes of the neighbourhood should have been turned has been evident to the reader from the first; but in a gossiping society such as that of the little Cornish town which Mr. Fenn describes it was not the less likely to gain currency because it was without real foundation. A man of Geoffrey's character might have been slow to detect the first indications of its existence; but, when he had fully realized the fact, his reasonable anger and his natural contempt for his slanderers would not, in any ordinary case, have prevented him from taking at once the necessary steps to clear his character. Instead of doing this, Geoffrey deliberately allows himself to remain under the imputation; and the Vicar, who had the sense to say to him, "It is unmanly not to clear your name," had not the courage to act on his conviction and to let the truth be known. "Maybe," Geoffrey said bitterly; "but I don't think I am like other men. I shall wait until Time shall bleach it once more white." Time, as far as common experience goes, is more apt to make damaged reputations mouldy than to bleach them, and Geoffrey had no right to calculate on any such catastrophe as that by which, to the great interest of Mr. Fenn's readers, all things come right in the end.

In a slighter paradox of an ecclesiastical sort there is probably an underlying vein of satire beneath the author's narrative. Decorations for harvest thanksgiving services are now sufficiently common, and we have seen the brilliant yellow of three or four vast vegetable marrows used with excellent effect as a base. Still, to the profane and unsymbolical mind, "turnips and carrots" and suchlike offerings may well suggest the idea of "a greengrocer's shop"; and, if the one product of Cornish industry may be represented in church, why not also that which supplies the fishmonger next door? Fish are "the harvest of the sea"; but "a pile of mackerel at the foot of the lectern" is a concrete way of setting forth an abstract proposition for which we imagine that congregations in general are hardly as yet prepared. So Tom Jenner's mates supposed; and so, in fact, did Tom himself. "It'll make a gashly old smell," he said; but, being dared to "take 'em up to parson," and the challenge being backed by several wagered gallons of ale, he made the experiment, and, as it turned out, with entire success, the Vicar taking the offering in perfect seriousness, and having "no thought of the men perpetrating a joke against his harvest festival." It is true that among recent harvest decorations—if the report of a local paper in the midland counties can be trusted—the usual "carrots and parsnips" have appeared in company with a "leg of mutton"; but is Mr. Fenn quite serious about the mackerel?

One of the minor characters among the Vicar's people is an elderly bank clerk, with a name which we may presume to be pronounceable in Cornwall, and with a habit which we think must have been entirely original, but which struck us as capable of being turned to some practical account. Mr. Chynoweth kept a private pack of cards in his office desk, and was accustomed, in his principal's absence, to play whist by himself under the lid. As an amusement, this can have been but mildly exciting; as an intellectual exercise, its merits may have been of a definite, though not of a high, order. In either aspect, it appeared to supply a rough but effective test for the classification of such works of fiction as our duty obliges us to read, or to attempt to read. We have accordingly tried the experiment—a hand first, then a chapter—and with distinctly marked results. Mr. Manville Fenn has no need to fear the comparison which he has been the means of suggesting. *The Vicar's People* will not incline its readers to a second deal; but, in the case of some other novels which need not be specified, we turned from the three volumes with a sigh of relief to the more attractive companionship of the three "dummies."

## MINOR NOTICES.

THOSE who are no longer young would probably not read this graceful and pleasant little story (1) if it were addressed to themselves, but many of them may be attracted by it if they find it in the hands of those to whom it is principally addressed. As far as the tale has a special purpose, it is apparently designed to connect the domestic interests of childhood with the love of poetry which sometimes deserves and rewards judicious cultivation at a very early age. The subject is only the first happy year in the country of a little town-bred girl; but she is the only child in the story, and her little experiences serve as a thread to connect half a dozen of her relations and friends, some of them with distinctive characters. Nearly all of them are supposed to have a taste for poetry, which furnishes an opportunity for collecting a large number of quotations, which are almost all descriptions of the moon; and, by a playful touch of fancy, most of them bear such names as Cynthia or Delia, which once personified the same luminary. The little girl, Margaret Esdaile, is taught that her name has been associated with the moon, as well as with the pearl and the daisy. Her title of "The Moonbeam" is a pet name, which is either the effect or the cause of a childish fondness for the moon. Mr. Grant, who, after his little grandniece, is the principal character in the story, has plausible reason for his answer to an inquiry as to the most beautiful of poetical passages relating to the moon. He quotes from the *Dream of Fair Women* the description of moonshine on a craggy mountain landscape:—

The balmy moon of blessed Israel  
Floods all the deep-blue gloom with gleams divine;  
All night the splintered crags that wall the dell  
With spires of silver shine.

The writer has overlooked the most perfect description of the moon in English verse in Mr. Tennyson's translation of the famous passage in Homer. Even Pope's version about the "refulgent lamp of night" could not wholly disguise its beauty. The little tale, though its simplicity is carefully maintained, is not wholly devoid of the interest proper to fiction. A bright and cheerful Lady Cynthia makes a happy marriage with a lover who, with unconscious conformity to local custom, applies to himself and to her a tender and thoughtful conceit from Browning's dedication of *Men and Women* to his wife. If, according to the poet, the Moon were "touched with human love,"

She would turn a new side to her mortal,  
Side unseen of huntsmen, herdsmen, steersmen,  
Blind to Zoroaster on his terrace,  
Blind to Galileo in his turret.  
God be thanked, the meaneast of his creatures,  
Boasts two soul-sides, one to face the world with,  
One to show a woman that he loves her.

Such true and subtle refinements of sentiment are, of course, far beyond the reach of the little heroine or subject of the story. Her own share in conversation is properly confined to questions, or to simple comments on her small store of knowledge and experience. It may be added that her friends, and especially her wise and kindly uncle, select the topics and fragments of information which would interest an intelligent child. A little girl living near the smooth Medway would take pleasure in learning that the river received its characteristic Celtic name of "honey-water" many centuries ago. In a former story, which had only the fault of being too tragic, Miss Lushington showed her knowledge of the lives and concerns of men and women. She also evidently understands the feelings of children, and on this occasion she has wisely abstained from allowing any interruption of varied and natural enjoyment, though she attempts to idealize everyday nursery life.

A flagrant instance of the lately introduced and detestable custom of issuing mutilated editions of standard works is found in Messrs. Bell's volume of *Select Tales by Maria Edgeworth* (2). The volume contains "Lazy Lawrence," "Tarleton," "Simple Susan," "The White Pigeon," and "Forgive and Forget"; and to the list of contents is affixed this remarkable note:—"The above Tales have been selected from the collection known as 'The Parents' Assistant,' as specially adapted for school use. The last two have been slightly condensed to bring the volume within the required compass." Now the "slight condensing" applied to bringing the volume within the required compass (required by whom?) amounts to a cutting out of some of the most characteristic and natural touches in the two stories. In other words, the two stories have been mutilated and spoiled to meet a "requirement" which, by whomsoever else it may be felt, is certainly not felt by readers. It is not only in omission, however, that the publishers or those to whom they have entrusted the "condensing" have sinned. They have committed the worse error of altering Miss Edgeworth's words. People who cherish a love for Miss Edgeworth's stories—and we hope that there are still many such people—will do well to avoid the mutilated edition which has seemed to us to call for these comments.

Major Griffiths generally writes in a pleasant and lively style, and in *Viscount Lacklands* (3) he has given us, within the limits of one volume of moderate size, as much matter as might have served many novel-makers for spinning out into three well-padded volumes.

(2) *Bell's Reading Books—Select Tales by Maria Edgeworth*. London: Bell & Sons.

(3) *Viscount Lacklands: a Tale of Modern Mammon*. By Major Arthur Griffiths, Author of "The Queen's Shilling," &c. London: Remington.

Naturally the colours are laid on with a good fat brush; there is no stopping to go into minute dissection of character and motive, and we must confess to being well pleased to come across a book which contains "a story" well and sharply told, and does not go in for the "delicate analysis" business, of which we seem to have had something too much of late.

Among the most welcome of present reprints is that of the third edition of "The History of Little Goody Two-Shoes (4), otherwise called Mrs. Margery Two-Shoes; with the Means by which she acquired her Learning and Wisdom; and in consequence thereof her Estate; set forth at large for the Benefit of those

*Who from a State of Rags and Care,  
And having Shoes but half a Pair;  
Their Fortunes and their Fame would fix,  
And gallop in a Coach and Six."*

Mr. Welsh's introduction, which touches on the still undecided question of the authorship of the little volume, is interesting and to the point. The authorship would seem to lie between Goldsmith and Giles Jones, "although," writes Mr. Welsh, "I am by no means anxious that the honour of having written it should be ascribed either to the one or to the other."

Some of Mr. Brett's sketches, which date back as far as 1840, had already appeared in the periodical called *Mission Life*. Many readers will be grateful to him for having reprinted these and added others to them (5). Mr. Brett has an observant eye, and tells us of many interesting experiences in an interesting manner. The illustrations to the volume are perhaps hardly worthy of the letterpress.

Mr. French is bringing out a Memorial Theatre edition of Shakespeare (6), to the first volume of which is prefixed an introduction which contains one passage worthy of special note. "The editor has frequently noticed among a theatrical audience some engaged with volumes of an ordinary edition of Shakespeare endeavouring, often vainly, to follow the text during the progress of the play. He would suggest that it would be more profitable, as well as pleasurable, to read the play before going to the theatre, and to give full attention to the actors' interpretation; but those who prefer to take their books will find this edition of the greatest service, as it shows at a glance the difference between the plays as written and now acted." This is effected by the simple means of printing the passages usually omitted on the stage in smaller type than the rest; and, on the whole, the idea of the volumes is a very good one, although we are not disposed altogether to admire the editor's well-meant Bowdlerization. It may be noted that he enters a protest against the evil custom of transferring the First Lord's speech in act 2, scene 1, of *As You Like It* to Jaques.

Mr. Muddock's little work (7), which is *à propos* of the increasing popularity of Davos-Platz as a winter resort for consumptive patients, contains a full account of the place and its properties, and also some reprinted articles on the Alps in Winter. In the interest of invalids Mr. Muddock makes a protest which is probably not too strong against the employment of German stoves in the Davos hotels.

The handsome volume (8) which contains the second part of the Liverpool Free Public Library Catalogue, gives ample evidence of the care and pains devoted to the well-being of an excellent institution. The considerable improvements which have been made since the issue of the first part are touched upon in the preface contributed by Mr. P. Cowell, the Chief Librarian, under whose supervision the work is published. The "Directions and Explanations" which follow this will also serve to show that nothing has been neglected in securing the best method of cataloguing that seems attainable, and people interested in the matter may do well to study them as well as the preliminary remarks.

The special object of Miss Ridley's capital contribution to fern literature (9) has been to supply the demand for a work showing the decided special features of ferns without an entire description of each one. The little book, it should be noted, contains a full description of the necessary technical terms.

Mr. O. Brookfield's *Illustrated Sporting Glossary* (10) consists of some of the most amusing grotesque drawings which we have seen for some time, given in mock illustration of the technical terms of the racecourse. Thus, "Beauchamp II. was nowhere" represents an empty course indicated by the simplest means; and "A well-known nobleman dropped a pony on the race" is illus-

trated with absurd literalness. Perhaps the best of all the sketches is "His owner had little or nothing on."

Mr. Moncreux Conway's volume concerning Carlyle (11) stands out distinctly from the several pieces of book-making which followed hard upon Carlyle's death. Mr. Conway had the advantage of knowing Carlyle well, having brought letters of introduction to him when he first came to England in 1863, and it is out of notes and memories accumulated during his long friendship with Carlyle that Mr. Conway's volume has come. "However inadequately transcribed and conveyed," he writes, "these pages do faithfully follow impressions made by his (Carlyle's) own word and spirit upon my mind during an intercourse of many years." Naturally there is much matter of interest in Mr. Conway's careful record of these impressions, which it is perhaps best to let readers become acquainted with for themselves. One part of the volume which has a special interest is the collection of extracts from early letters contributed by Mr. Ireland. It is perhaps worth noting that Mr. Conway writes at the end of his preface that the Carlyle he remembers is "a man I can by no means identify with any image that can be built up out of his *Reminiscences*. I do not wish to idealize Carlyle, but cannot admit that the outcries of a broken heart should be accepted as the man's true voice, or that measurements of men and memories, as seen through burning tears, should be recorded as characteristic of his heart or judgment."

Haydn's *Dictionary of Dates* (12), of which we have now a seventeenth edition, brought down to 1881, needs no comment as to its value. It is now, as a matter of fact, more "Vincent's Dictionary of Dates" than Haydn's, though of course the credit of the original idea belongs to Haydn. The work was first published in 1841, and in 1855 Mr. Vincent was asked, and consented, to supervise a seventh edition. "This," writes Mr. Vincent in his preface, "led eventually to my undertaking its thorough renovation, which has been effected by long continued labour in revision and in selection from an abundance of valuable materials, and now little of the original work remains, the present edition containing twice as much matter as the sixth, published in 1853." It is scarcely necessary to say that, as it stands, the work is unrivalled as a book of reference, and is, in fact, what Mr. Vincent modestly says he has endeavoured to make it—more a digested summary of every department of human history than "a mere Dictionary of Dates."

A sixth edition has appeared of M. Deschanel's *Treatise on Natural Philosophy* (13), translated by Mr. Everett, who has also acted as editor, and introduced various valuable modifications and additions in the latest edition as in previous ones.

A fourth edition, revised and much enlarged, is issued of Mr. Webb's useful volume (14) devoted to furnishing the owners of ordinary telescopes with directions how to use them to the best astronomical advantage.

Mr. Arthur Evershed has brought out a second series of nine etchings from nature of Thames subjects (15) which will be welcomed by all lovers of Thames scenery and of the art of etching. Mr. Evershed's method has been this; he "took the plates (ready grounded) and needles to the riverside, and made the drawings on the copper directly from nature, 'biting-in' subsequently at home," a process by which, of course, the subjects drawn are reversed in printing. It is giving Mr. Evershed high praise to say that his treatment is worthy of the beauty of the subjects he has chosen, among which are "Kingston Bridge," "At Kew Bridge," and "Syon House." It may be desirable to add that only one hundred copies of this attractive series are issued.

The author of *Waitaruna* (16) tells us that he has aimed at giving some true pictures of life in the southern portion of the colony of New Zealand as it was a short time ago, and he seems to think that in making the attempt he has broken fresh ground. We can however assure him, without disparaging *Waitaruna*—which is a lively enough story—that we have read many books of the same calibre and dealing with the same part of the world.

Mr. McIntock undertook his translation of *Die Harzreise* (17) in consequence of "a remark in one of our leading reviews, that, while many hands had translated scraps of Heine's verse, there had not been offered to the English public any connected or complete work, and the *Reisebilder* were suggested as being suitable." Mr. McIntock's translation is, in the few passages which we have compared with the original, accurate and it runs so well and smoothly that we hope he will receive more than "the very

(4) *Goody Two-Shoes*. A Facsimile Reproduction of the Edition of 1766. With an Introduction by Charles Welsh. London: Griffith & Farran.

(5) *Mission Work among the Indian Tribes in the Forests of Guiana*. By the Rev. W. H. Brett, B.A. London: S.P.C.K. New York: Young & Co.

(6) *Shakespeare*. The Memorial Theatre Edition. *As You Like It*. *Twelfth Night*. *Much Ado About Nothing*. Edited by C. E. Flower. London: E. French.

(7) *Davos-Platz as an Alpine Winter Station for Consumptive Patients*. By J. E. Muddock. With Analytical Notes on the Foul Air, Water, and Climate, by Philip Holland. London: Simpkin, Marshall, & Co. Paris: Gallani Library.

(8) *Catalogue of the Liverpool Free Public Library*. Established by the Mayor, Aldermen, and Burgesses, 1850. Reference Department. Part II. Containing the books received from January, 1871, to December, 1880. Compiled, by Authority of the Council, under the Direction of the Chief Librarian. Liverpool: Marples & Co.

(9) *A Pocket Guide to British Ferns*. By Marian S. Ridley. London: David Bogue.

(10) *The Illustrated Sporting Glossary*. By Charles H. E. Brookfield.

(11) *Thomas Carlyle*. By Moncreux D. Conway. London: Chatto & Windus.

(12) *Haydn's Dictionary of Dates and Universal Information relating to all Ages and Nations*. Seventeenth Edition. Containing the History of the World to the Autumn of 1881. By Benjamin Vincent, Librarian of the Royal Institution of Great Britain, &c. London: Ward, Lock, & Co.

(16) *Waitaruna: a Story of New Zealand Life*. By Alexander Bathgate. London: Sampson Low & Co.

(17) *A Trip to the Brocken*. By Heinrich Heine. Translated by B. McIntock. London: Macmillan. Liverpool: Adam Holden.

moderate amount of approval" which will induce him "to continue what is to him a labour of love."

Some industrious person has compiled a volume of snippets from Thackeray's writings (18). Why such volumes are compiled, who reads them, and what good the people who read them get from them, we are unable to understand.

We can do no more than name many treatises on law and new editions of well-known works. Among the former are a treatise on trade-marks, British and foreign, by Mr. Hardingham (19); an addition to Wilson's Legal Handy Books in the shape of a treatise on the Law of Horses by Mr. C. Morrell (20). To the same class belongs Mr. Roscoe's Digest of the Law of Light (21), and Mr. Shirley's "Elementary Treatise on Magisterial Law" (22). A second edition has appeared of Mr. Chalmers's "Law of Bills of Exchange" (23), with added cases, and a chapter on "Securities or Bills of Exchange." A second edition has appeared of Peel's "Practice and Procedure in Chancery Actions" (24), while Mr. J. V. Essey Fitzgerald's "Public Health and Local Government Act," 1875 (25), has reached a third edition.

It is only necessary to notice the appearance of a ninth edition of *Willich's Popular Tables* (26), and of the twelfth volume of Royal Colonial Institute's "Report of Proceedings" (27).

(18) *Extracts from the Writings of W. M. Thackeray*, chiefly Philosophical and Reflective. London: Smith, Elder, & Co.

(19) *Trade-Marks: Notes of British, Foreign, and Colonial Law*. By George Gatton Melhuish Hardingham. London: Stevens & Sons.

(20) *The Law of Horses*. By C. F. Morrell, Esq. London: Effingham Wilson.

(21) *A Digest of the Law of Light*. By F. S. Roscoe. London: Reeves & Turner. 1881.

(22) *An Elementary Treatise on Magisterial Law*. By W. T. Shirley. London: Stevens and Sons. 1881.

(23) *A Digest of the Law of Bills of Exchange, Promissory Notes, and Cheques*. By M. L. Chalmers, M.A. Second Edition. London: Stevens & Sons.

(24) *A Concise Treatise on the Practice and Procedure in Chancery Actions*. By S. Peel. London: Stevens & Sons. 1881.

(25) *The Public Health and Local Government Act*. London: Waterlow Bros. & Layton.

(26) *Willich's Popular Tables*. London: Longmans & Co.

(27) *Royal Colonial Institute—Report of Proceedings*. London: Sampson Low & Co.

In reference to our article of last week on "Vegetarianism," Dr. Anna Kingsford complains that our "confession of ignorance" as to whether her thesis by itself obtained for her the degree of M.D. at the Paris University is calculated to injure her in her profession. We are sorry that Mrs. Kingsford should have taken seriously what was meant in another manner; and we may now tell her that our readers are probably as well aware as ourselves of the high standing universally accorded to the Paris medical degree, and of the completeness of its guarantee for the efficient training of those to whom it is given.

#### NOTICE.

We beg leave to state that we decline to return rejected Communications; and to this rule we can make no exception.

#### THE UNITED STATES.

The Annual Subscription to the SATURDAY REVIEW, including postage to any part of the United States, is £1 10s. 4d., or \$7 58 gold, and may be forwarded direct to the Publisher, Mr. DAVID JONES, at the Office, 38 Southampton Street, Strand, or to Mr. B. F. STEVENS, American Agency, 4 Trufolgar Square, London. International Money Orders can be sent from any office in the United States, and Subscriptions, payable in advance, may commence at any time.

#### PARIS.

Copies of the SATURDAY REVIEW may be obtained every Saturday of M. FOTHERINGHAM, 8 Rue Neuve des Capucines.

The SATURDAY REVIEW is duly registered for transmission abroad.

The publication of the SATURDAY REVIEW takes place on Saturday Mornings, in time for the early trains, and copies may be obtained in the Country, through any Newsagent, on the day of publication.

Nearly all the back Numbers of the SATURDAY REVIEW may be obtained through any Bookseller, or of the Publisher, at the Office, 38 Southampton Street, Strand, W.C., to whom all Communications relating to Advertisements should likewise be addressed.

Now ready, VOLUME LI., bound in cloth, price 10s. Cloth Cases for Binding all the Volumes, price 2s. each. Also, Reading Cases, price 2s. 6d. each. May be had at the Office, or through any Bookseller.

Copies of the SATURDAY REVIEW Bill of Contents will be forwarded every Friday Evening by post, prepaid, to any Newsagent in Town or Country on application to the Publisher.

## ADVERTISEMENTS.

DORÉ'S GREAT WORKS, "CHRIST LEAVING THE PRÆTORIUM," "CHRIST ENTERING JERUSALEM," and "MOSES BEFORE PHARAOH," each 24 by 24 feet, with "Dream of Piatto's Wife," "Christian Martyrs," &c. at the DORÉ GALLERY, 35 New Bond Street. Daily, Tenth to Six. Is.

THE ANNUAL WINTER EXHIBITION OF HIGH-CLASS PICTURES, by BRITISH and FOREIGN ARTISTS, including Benjamin Constant's New Picture "Present to the Ameer," is NOW OPEN, at ARTHUR TOTTEN & SONS' Gallery, 5 Haymarket, opposite Her Majesty's Theatre. Admission, Is., including Catalogue.

GOOD READING, RECITATION, ORATORY.—A retired BARRISTER, an Oxford Man, and former Pupil of distinguished Tragedians and Elocutionists, instructs LADIES and GENTLEMEN, privately or in Classes. Clergymen, Barristers, and Students specially prepared. Recites or visits. Literary Lectures and Recitations given. Schools attended. Terms moderate.—Address, DELTA, Grosvenor Gallery Library, Bond Street, W.

SOMERSETSHIRE COLLEGE, BATH.—The College is divided into Classical and Modern sides. BOARDERS are taken in the Senior Department by the Head-Master; in the Junior Department by the Rev. PHILIP CRICK, M.A. Special attention is given to Dialectic or Backward Boys.—For Prospectus, List of Honours, &c., apply to the Head-Master, T. M. BRUMLEY, M.A.

WOOLLEY GREEN, near HURSLEY, HANTS.—A. M. HEATHCOTE, B.A., Oriel Coll., Oxford, prepares YOUNG BOYS for Public Schools, &c. Number under Twenty. Two Resident Assistant-Masters. The house is quiet in the country, and in a healthy position. Full particulars on application.—Address, Woolley Green, near Romsey.

THEOLOGICAL, UNIVERSITY, MILITARY, CIVIL SERVICE, and other EXAMINATIONS.—PUPILS rapidly and successfully prepared. Terms moderate. Highest references.—Address, Rev. W. H. ROWLANDSON, Great Braxted, Wilham.

HYERES, South of FRANCE.—An OXFORD M.A., and Barrister-at-Law (Married), an experienced and successful Tutor, residing in his own Villa, which is most beautifully and healthily situated, receives SIX PUPILS in delicate health. Special advantages for French conversation.—Address, W. HENLEY CHATEL, Les Rosignols, Hyères (Var), France.

INDIAN BOYS.—Rev. R. A. CAYLEY desires to make a HOME for Two or Three (brothers preferred), aged from Eleven to Sixteen, and to send to Public School with his own Sons.—For terms, &c., apply Beaumont Rectory, Lincoln.

HIGH CROFT, GODALMING.—Mr. ALGERNON FREDMAN, M.A. Oxon., prepares a limited number of the SONS of GENTLEMEN for Entrance and Scholarship at Eton, Harrow, Charterhouse, and the other Public Schools. High Croft is on a fine and open site, in the healthiest and most beautiful part of Surrey. There is a good playground, with tennis-courts, &c., and a large health with cricket-field adjoining. The sanitary and domestic arrangements are perfect. Prospectus on application.

AMESBURY HOUSE, PAGE HEATH, BICKLEY, Kent.  
Rev. EDMUND FOWLE, Author of a very successful Series of Latin and Greek School Books, receives THIRTY-THREE BOYS, under the age of Fifteen, to prepare for the Public Schools.

RESIDENCE offered in the House of a Married PROFESSIONAL GENTLEMAN (Barrister), in the healthiest part of Notting Hill. Would suit any one preparing for the Law, or for Political Life, and whose Parents do not reside in Town. Terms, 400 Guineas per annum, which are payable half-yearly or quarterly in advance, includes fee for superintending professional studies. The Advertiser is a distinguished University scholar (Oxford), and has had over ten years' experience in practice and tuition, and he receives in his household and PUPIL only.—Address, VIMAX, care of Messrs. Street Brothers, 5 Marie Street, Lincoln's Inn, W.C.

SECRETARY, CASHIER, or CONFIDENTIAL CLERK.—An APPOINTMENT desired by a GENTLEMAN, of considerable business experience, well accustomed to Book-keeping, Correspondence, and the Financial part of business. A moderate salary only required. The highest references can be given as to integrity and trustworthiness.—Address, M. & Villa Road, Brixton, S.W.

## THE COLSTON SPEECHES.

THE Bristol custom which is associated with the name of COLSTON reproduces a system of College declamations which has probably become obsolete at the Universities. The academic disputants were instructed to defend opposite sides in some moral or historical controversy, without previously comparing notes for the purpose of answering one another's arguments. The more experienced orators of the "Dolphin" and "Anchor" at Bristol can scarcely fail to discuss the same political questions. To expose or to cover the weak points in the policy of the Government is the proper business of the respective speakers for the Opposition and the Ministry. The annual contest would be still more interesting if care were taken that the combatants should be equally matched. It seems scarcely fair that Lord SPENCER and Sir HENRY JAMES should be pitted against Lord SALISBURY and Mr. GIBSON; but as the balance has inclined the other way in some recent provincial discussions, the advantage which the "Dolphin" may have had over the "Anchor" is perhaps not to be grudged. In any case, a vigorous speaker prefers the opportunity of attack to the tamer process of apologetic statement and argument. It was for this reason that Sir W. HARCOURT dilated at Glasgow and Carlisle on the alleged errors of Lord BEACONSFIELD's Government in preference to vindicating a domestic policy with which he perhaps feels no profound sympathy; but it is dull work to resuscitate the ghosts of dead issues for the purpose of exposing their failings. The Land Act, with the prospective comments of its authors, and with the glosses lately affixed to it by the Sub-Commissioners, is more present to the minds of contemporary politicians than the treaty of Berlin, or even the naval demonstration. Lord SPENCER, a highly estimable nobleman, but not a great political gladiator, engaged in a conflict with phantoms even less substantial than the shadows of the past. His denunciation of Fair-trade was directed against fallacies which died almost before they were born:—

*Quos dulcis vite exsortes, et ab ubere raptos  
Abstulit atra dies, et funere meruit acerbo.*

The Conservative party will scarcely suffer from Lord SPENCER's elaborate attack on Mr. LOWTHER, who has not even been a Cabinet Minister, and who, greatly to his credit, declines to dabble in Fair-trade. That the Opposition includes in its ranks a clever man who has the misfortune to believe in Protection is a smaller misfortune than the adhesion of Mr. BRADLAUGH to the Government. Lord SPENCER's insinuation that Lord SALISBURY shared Mr. LOWTHER's heresy was founded on a mistake. Additional duties on luxuries, or, in other words, on French wine and brandy, whether or not such imposts are expedient, would be compatible with the strictest principles of Free-trade. The ATTORNEY-GENERAL, indeed, says that his predecessor in office lately included corn and meat in the list of luxuries. If the quotation is accurate, Sir JOHN HOLKE has once more proved that an excellent lawyer may be a bad political economist. No member of the late Cabinet has at any time assented to schemes for taxing food or raw material.

In the course of a spirited address Sir HENRY JAMES unnecessarily hampered himself with the defence of one or two startling paradoxes. Referring to the Birmingham maxim that force is no remedy, he justly contended that in certain cases, as in that of the present condition of Ireland, there is no remedy but force.

The apparent contradiction is only to be reconciled by Mr. CHAMBERLAIN's theory that it was not desirable to remedy violence and anarchy by force or by any other method as long as disorder facilitated the legislation which was regarded by the Government as indispensable. Not wishing to pledge himself to so remarkable a conclusion, the ATTORNEY-GENERAL must have left his audience in doubt whether rulers should bear the sword *in fine*. He was perhaps in a hurry to enunciate the still more astonishing proposition that Lord SALISBURY was responsible for the Land Bill. It is true that the leader of the majority of the House of Lords could have destroyed the Bill on the second reading, and that the third reading passed with his permission; but it scarcely follows that his supporters "are estopped from denouncing an Act "which they could have stayed in its course, but did not." From the moment at which the Bill was introduced it became the minimum of concession which Parliament could make to the Irish tenants. The Government, and not the Opposition, is exclusively responsible for any injustice which the Act may involve. Lord SALISBURY and his party rightly judged that the evil results of defeating the Bill would be even greater than the consequences of negatively sanctioning a measure of which they disapproved. No Government has a right to fasten on the Opposition the dilemma of voting for a questionable policy, or of defying the combination of a Parliamentary majority with a disaffected community. It may be said, without disrespect to Sir HENRY JAMES, that the part of his speech which related to Ireland was less weighty than the moderate argument of Mr. GIBSON. On the important question under discussion the English ATTORNEY-GENERAL is not an expert.

Lord SALISBURY declined to waste time on the discussion of the foreign policy of the late or present Government. As he truly said, the attention of all men is fixed on Ireland; and the prospect is not reassuring. Mr. GIBSON's criticism of the proceedings of the Land Commission was the more forcible because it was transparently candid and studiously moderate. He was undoubtedly justified in his disapproval of Justice O'HAGAN's opening speech, though it may be understood how the President of an anomalous tribunal should allow himself to deviate from the uniform course of judicial practice. As Mr. GIBSON said, the monstrous proposition was laid down by some of the Sub-Commissioners are still open to appeal; but it is in the highest degree unsatisfactory to find that political partisans and agrarian projectors have been appointed to offices which required the strictest impartiality. Lord SALISBURY was perhaps scarcely just in attributing to Mr. GLADSTONE as a deliberate purpose the speculation which seems but too likely to be the result of his favourite legislative measure. During the discussion of the Bill Mr. GLADSTONE frequently expressed his belief that the majority of Irish landowners would not be subjected to any loss of income. It may be conjectured that he now regards with disapproval or uneasiness the administration of the Act by the Sub-Commissioners. There is perhaps a difference of principle, as well as of amount, between 25 per cent. and 75 per cent. of reduction. The smaller penalty is not, like Mr. PARNELL's recurrence to prehistoric values, a perfectly arbitrary transfer of property. Lord SELBORNE explicitly repudiated the intention of diminishing in any degree the total value of Irish land.

In the expression of his regret that Lord HARTINGTON had no influence in the Cabinet Lord SALISBURY was per-

has not wholly serious. He may have wished to appeal to the supposed chief of the moderate section of the Government against the subversive designs of some of his colleagues. Mr. CHAMBERLAIN announces great political changes as impending, and it would be interesting to know whether they will be generally acceptable to his colleagues. It is believed that Lord HARTINGTON is not of an unduly pliable disposition, and that on all important questions he has opinions of his own. It was understood that he approved generally of the Irish Land Bill, though he took no part in the Parliamentary debates. He has now taken the first opportunity of announcing his opposition to the predatory proposals of the Farmers' Alliance. Like Lord SALISBURY, he will be indisposed to give the Guardians in every Union the opportunity of fixing the rents to be paid by themselves and by the other farmers. The ATTORNEY-GENERAL apparently intended to express the same opinion in his defence of Lord HARTINGTON's reference to the entirely distinct subject of the tenure of land. In acknowledging the omission in Mr. GLADSTONE's Guildhall speech of minatory proposals, Lord SALISBURY reasonably doubted whether the changes to be introduced into Parliamentary proceedings were solely designed to facilitate Bankruptcy Bills, and Bills for the prevention of floods. That a formidable sabre should be sharpened for the purpose of spreading bread and butter seemed, in Lord SALISBURY's judgment, to be improbable. On the whole, the CONVENTION debates were neither dull nor uninteresting, and the party combat was conducted with good humour. If the leaders of both parties should think fit to suspend their polemical exertions from this time to the meeting of Parliament, the country would not be ungrateful for their forbearance; but in the few days which have elapsed since the Bristol celebration, Mr. GOSCHEN and Sir R. CROSS and Mr. GIBSON have continued the party controversy. One result of such discussions is to confute the popular saying that facts are stubborn things. The toleration which was for an entire year accorded to the Land League is an undoubted fact; but to Conservative speakers and to impartial observers it takes the form of scandalous dereliction of duty; while Mr. GOSCHEN, looking at events from a distance, only thought that the Government gave the Land League a good deal of rope. There is some reason to fear that the speeches on both sides will continue till the meeting of Parliament.

#### LORD GRANVILLE ON EGYPT.

LORD GRANVILLE'S despatch to Sir EDWARD MALET sums up, with some necessary reserve, but still with adequate precision, the present policy of England towards Egypt. The primary aim of that policy is to ensure that Egypt shall be decently well governed, and that a reforming and orderly Government shall show itself able and willing to take full advantage of that amount of independence which has been accorded to Egypt by the Porte. During the last two or three years very considerable reforms have been made. The taxes are no longer oppressive, the finances are in good order, the prosperity of the people is rapidly increasing. One great reform which has been long in contemplation—that of a new system of justice for the people—is on the point of being carried out; and Lord GRANVILLE urges that there shall be no delay in supplying what has now become the chief, and perhaps the sole, real deficiency in Egyptian administration. If the work is done, and well done, it is a matter of perfect indifference to England by whom it is done. Lord GRANVILLE protests against the notion that there has been, or is to be, anything like a specially English Ministry. It is not the business of our representative in Egypt to support one Minister, or one Ministry, rather than another. All that we want is that there shall be some Government that secures the tranquillity and prosperity of the country. Our chief reason for wishing Egypt to be tranquil and prosperous is our overwhelming interest in the security of the Suez Canal; but, so long as Egypt is tranquil and prosperous, we have the best possible guarantee for the security of the Canal. In time of peace a good and strong Government prevents those local disturbances by which the safety of the Canal might be very easily endangered. In time of war a good and strong Government would either keep open the Canal for us, or, if we were obliged to step into its place, we should find all the machinery for keeping order ready to our hand. A good

Government in Egypt can do for us all that we want, and better than we could do it for ourselves. We now attain our object without any cost, and without exciting any ill will. It might, in the last resort, be necessary, but it would be eminently disadvantageous, to substitute for the cheap and peaceable safeguard the safeguard of direct intervention, which would be efficacious—for, if it were undertaken, it would have to be done thoroughly—but which would impose on us constant anxiety and a heavy outlay, would awaken the jealousy, if not the enmity, of France, would kindle the suspicions of every European Power, and might blow into a flame the smouldering fire of Mahomedan fanaticism. Lord GRANVILLE is perfectly justified in saying that what we want, and what it may be fairly said we have got, up to the present time, is nothing more than an Egyptian Government that will do our work for us, and will save us from the many dangers that must inevitably attend our doing it by any form of violent interference.

But the present state of things in Egypt, favourable as it is to England, and based as it is on the solid grounds of wise reforms and increasing prosperity, is menaced by serious dangers. In no country, and above all in no Eastern country, can a Government have more than a hollow show of strength when the reigning prince has meekly listened to an announcement made by riotous soldiers that they had his successor ready if he would not do all that they ordered him to do. The ringleader among the insubordinate officers has not abandoned his business of dictation. He was induced to take his regiment away; but he himself comes back quietly and triumphantly to Cairo, and superintends the Government which was supposed to have got rid of him. He has taken over the lapsed power of the KHEDIVÉ; and acts as a kind of ultimate referee when it has to be decided what the Government shall do or shall not do. Anarchy appeared in Egypt when the KHEDIVÉ submitted to the colonels, and it may reappear any day in a much more serious shape. Lord GRANVILLE was bound to contemplate the possibility of anarchy again showing itself, and he distinctly lays down that, if anarchy does show itself, England will, if necessary, abandon its present policy of abstention. What action it will take in a hypothetical, although far from impossible, case, Lord GRANVILLE was far too prudent to explain. It is impossible to say beforehand what England will do or ought to do. Everything will depend on the causes which, at the time, are found to have provoked the recrudescence of anarchy. All that can be done at present is to study the probable causes of anarchy, and to minimize each danger as it shows itself. One danger is that of popular discontent. To guard so far as he can against this, Lord GRANVILLE urges the Egyptian Government to go boldly and quickly in the path of reform, and to remove every tangible and remediable grievance; and he clears away one obstacle to the acquisition of the confidence of the people by the Egyptian Government when he announces that England neither makes nor supports Egyptian Ministries. Another source of possible danger is the alarm inspired by the French occupation of Tunis. When Egyptians hear of what M. FERRY called the mortal blow given to Mahomedan fanaticism by the capture and desecration of Tunis, they can scarcely help feeling that the blow has fallen in part on them, and that heavier and more direct blows may follow. Lord GRANVILLE does what he can to dispel these fears by remarking that the supremacy of the Porte is the best protection Egypt can have against foreign aggression, and that England intends to uphold this supremacy, because it is the best check on foreign aggression that can be found. By foreign aggression nothing can now be meant but French aggression; and Lord GRANVILLE repeats the warning he has often given, that a sharp line must be drawn between an attack on Tunis—where the supremacy of the Porte was of a very shadowy or non-existent kind—and an attack on any territory over which the Porte exercises a supremacy that is incontestable.

There can be little doubt that the Ministry of CHEIKH PASHA will do what it honestly can in the way of reform, and that France is far too sick of the Tunis expedition to have any present designs on Egypt. The immediate danger to Egypt comes neither from popular discontent nor from France. It comes from the humiliation to which the KHEDIVÉ has submitted, and much more from the Porte. The Porte wishes to give its supremacy in Egypt a new colour, and to exercise it in a new direction. It wishes to make the supremacy

of the SULTAN not the supremacy of a political superior, but the supremacy of a religious chief. Egypt is to be enrolled into the great army of the Caliphate, and a special use is to be given to its adhesion by making it an instrument for the control of Arabia, from which the chief dangers to the Caliphate are likely to arise. What the Porte wants is to get Egypt quietly, but effectually, into its hands, and the means it adopts is to play off now the colonels against the KHEDIVÉ and now the KHEDIVÉ against the colonels. It provides the colonels with a successor to the KHEDIVÉ, and then sends emissaries to lecture the colonels on the guilt of military disobedience. And these emissaries, while charged with the general duty of enfeebling Egypt by keeping up this game of see-saw, are also charged with the special duty of conferring with delegates from the chief centres of religious influence in Arabia. The great thing which the SULTAN has at heart is to get Egypt to commit itself by sending troops to some Arabian port. It will not be the strength of the troops sent that will be important. A single battalion would suffice to show that Egypt was carrying out the orders of the CALIPH. That this new colour shall not be given to the SULTAN's supremacy, and that the efforts made in this new direction shall fail, is of the very greatest importance to England; for there could not be any danger to the security of the Canal greater than that Egypt and Arabia should be in conflict. It is indispensable for the interests of England that the danger should be avoided; but all that Lord GRANVILLE can do openly is to remind the Porte that there are limits fixed to the power of the Porte over Egypt, and to insinuate that England will not allow this limit to be overpassed. He cannot indulge in vague threats of punishment which would follow on the execution of designs which are as yet hardly apparent, and could not be proved if denied. All that can be done is to work through the ordinary channels of diplomacy, and by the exercise of patience and firmness to bring it home to the SULTAN that, if he thinks he is going to get Egypt out of the control of England, he is very much mistaken.

#### THE APOTHEOSIS OF M. PAUL BERT.

M. GAMBETTA'S entrance upon office has been so long waited for that it was perhaps impossible that it should not, when it came, be attended with some disappointment. The time and the circumstances were not well chosen for making the incident effective. If he had been sent for by M. GRÉVY immediately after the elections he would have seemed to be marching to the Elysée with all France behind him. In the months that have followed there has been so much controversy as to whose the majority was, and what policy the electors meant to support, that now that M. GAMBETTA has really become Prime Minister, the achievement has been a good deal dashed. Neither the names of his subordinates—it would be a misuse of words to call them his colleagues—nor the declaration which, according to custom, the new Cabinet made in both Chambers, have supplied the missing enthusiasm.

Among the Ministers with whom he has surrounded himself, there is only one whose name is known outside France. M. PAUL BERT has undoubtedly earned for himself political distinction of a certain kind. He is very much given to speaking on religious questions, and he is very happy in seasoning profanity with the precise amount of indecency which commends the mixture to the palate of the French *libre-penseur*. To call incense the tobacco of saints, and to group together the phylloxera and the religious orders as the twin pests which call for the application of a searching insecticide, are M. BERT's least oratorical achievements; but, unfortunately, they are amongst the few which can be presented to English readers. These are the qualifications which have led M. GAMBETTA to confer upon M. BERT the two posts of Minister of Education and Minister of Public Worship. Both appointments are remarkable. The Minister of Education has to put into working order the statute which has secularized all the communal schools in France. However necessary this measure may have been, it is plainly one which must bring the Minister into frequent collision with the ecclesiastical authorities. That is a risk which, under the Republican Government, every Minister of Education has had to put up with as he best might; but

the extent of it is a good deal affected by the character and antecedents of the particular Minister. M. GAMBETTA would, no doubt, have found it difficult to find a Minister of Education who should be at once *persona grata* to the clergy, and willing to take office in a Ministry of the Advanced Left. But he might easily have found a Minister who, so far as his public antecedents are concerned, should have been simply colourless. Instead of this he has picked out the man of all others who is most, and most justly, distasteful to the clergy. His object apparently is to accentuate all the strong things that the Government may feel disposed or compelled to do in the way of discouraging religious education, and to accustom the clergy to expecting the worst. Even if for some unexplained reason M. GAMBETTA had thought it expedient to sound a note of defiance over the whole of the educational field, he might have been glad that the Ministry of Public Worship was attached to the Ministry of the Interior, and not to the Ministry of Education. In this way it would have been possible for M. WALDECK ROUSSEAU to apply balm to the wounds which M. BERT might find it necessary to inflict. If the Government intends to quarrel with the parochial clergy, it might have been convenient to be by comparison on decent terms with the bishops, with whom the Minister of Public Worship is constantly brought into contact. There is seldom much to be gained from insulting as well as injuring an enemy, and a few civil speeches from the chief of one department may go some little way towards making the Church forget the very different speeches thrown at her head by another. Consequently, even if M. BERT's predecessor had been Minister of Public Worship as well as of Education, it would have been a natural step for M. GAMBETTA to separate the two offices. Instead of this, he has gone out of his way to reunite them. He found the Ministry of Public Worship associated with the Ministry of the Interior; but his conviction of M. BERT's supreme qualifications for ecclesiastical administration is so profound that, in order to give effect to it, he has associated the Ministry of Public Worship with the Ministry of Education.

The choice is even more remarkable because there is a passage in M. GAMBETTA'S programme which seems to imply that one of the ends which the new Government have in view is a revision of the actual relations between the Government and the Church. Of course this intention is not stated in so many words. When a French Republican Minister wishes to revolutionize the existing order of things, he is always particularly careful to say that he is merely carrying out some law which has been allowed to fall into disuse. It never seems to occur to him that the fact that a law has become obsolete is *prima facie* evidence, at the least, that it is no longer suited, or that it never was suited, to the circumstances to which it has to be adapted. M. GAMBETTA is not going to abolish the Concordat; he is only going to apply it strictly. In other words, he is going to throw aside all the softening interpretations which a regard for public convenience has put upon the letter of the Concordat, and to place the relations between Church and State on a footing designed to meet a condition of affairs which is now eighty years old. Whether this intention be wise or foolish in itself, it makes frequent collisions between the two powers all but inevitable. It may not very much matter whether, in these circumstances, the MINISTER of PUBLIC WORSHIP has the gift of conciliating opponents; but there was no need for M. GAMBETTA to take special pains to pick out a Minister whose sole merit in ecclesiastical matters is that the mere mention of his name is enough to throw a Roman Catholic, whether priest or layman, into a violent passion. For it must not be omitted from the list of M. BERT's merits that he is hated, not by the French clergy only, but by French Catholics. Other speakers of this kidney have aimed at drawing a distinction, shadowy enough indeed, but still meant to look substantial, between clericalism and religion. M. BERT has risen superior to any such subterfuges. He glories in treating the two as identical. He takes every occasion of proclaiming that it is the religious instinct in man with which he wages war—that the objects of his hatred are not the absurdities of Catholicism, but the degrading belief in the existence of a Being greater than man, in which belief those absurdities have their origin. There is, indeed, one possible explanation of M. BERT's appointment which ought not to be altogether left out of sight. It is conceivable—we can hardly say that it is more than conceivable—that M. GAMBETTA may

deliberately mean his bark to be worse than his bite. He may wish, if possible, to conciliate his more advanced supporters, and he may think that there is no more assured way of doing this than by insulting every religion in his choice of a Minister of Public Worship. With M. BERT in office, even a favour done to the Church would have the air of an insult, and M. GAMBETTA may think that under this cover it may be easier for him to manage ecclesiastical affairs in a spirit of reasonable compromise than if he had a less violently irreligious Minister as his lieutenant in the department of Public Worship. In the case of most men this theory would be too far-fetched to deserve a moment's thought. In the case of M. GAMBETTA, it just stops short of being that. There has always been a great deal of *finesse* about his conduct of affairs, and in this way he may possibly see his way to being milder in deed, from the fact that he has been so fierce in word. In the improbable event of this theory being true, M. GAMBETTA will have to run the risk that the people whom he hopes to soothe by the policy he adopts towards them may be hopelessly alienated beforehand by the language in which this policy will have been described.

The declaration read on Tuesday was exceedingly colourless upon every point except that of the revision of the Constitution. Upon that point, France is said to have "marked her resolution." The revision is to be "limited," but there is to be revision. In other respects the declaration might have been made by any Ministry under the sun. The reforms that are promised are not described, or only so far described as is consistent with a most convenient degree of vagueness. Even Prince BISMARCK would be willing to say that he was anxious to reduce the army, so far as it can be done without impairing the defensive strength of the country; and Protectionists and Free-traders might agree to lighten the burdens which press on agriculture if it can be done without jeopardising the finances of France. The determination to maintain order while protecting the public liberties is worthy of NAPOLEON III. In short, M. GAMBETTA seems to have borrowed the safest platitudes from each of his predecessors, in the hope that they would be accepted by each section of the Republican party as supplying some ground for hope that it is to their views that the new Minister means to give effect. The only result of this effort at compromise, or rather at concealment, has been to start a cry, before the Cabinet is a week old, for an interpellation which shall make it clear what the Government is really going to do. Foreigners may wait to satisfy their curiosity on this point until it pleases M. GAMBETTA to show his faith by his deeds; but his own countrymen—or the politicians among his own countrymen—are anxious to have some clearer assurance from himself than he has yet been pleased to give. That M. GAMBETTA may be willing to give any number of assurances similar in kind to his declaration is likely enough, but it will be surprising if he is in any hurry to depart from the convenient obscurity in which he has been pleased to shroud himself.

#### MR. BRIGHT AT ROCHDALE.

ROCHDALE has celebrated, with an enthusiasm that was graceful because it was sincere, the seventieth birthday of the popular orator and Cabinet Minister whom his memories, his fortune, and his affections have associated with the town of his birth. The workmen in the mills long carried on by his family addressed Mr. BRIGHT in the morning, and the general body of the townsmen of Rochdale paid their tribute to him in the evening. When a man has deserved honour by a long, active, and unselfish life, it is satisfactory that he should receive it, and all England is interested in full justice being rendered to every statesman of every party. Naturally, in replying to the addresses he received, Mr. BRIGHT reviewed the past on which he has left his mark, and the measures to which he has devoted his energies and his eloquence. Free-trade, a cheap press, an extended suffrage, national education are the triumphs of his life, and, in part at least, the fruit of his personal efforts. To the success of every cause he has taken up he has brought the aid of intense conviction, of sensitive pugnacity, and of an eloquence which, always clear and simple, was stately in its more solemn efforts, and was often felicitous in its epigrams. No one doubts that his motives have been pure and his conduct disinterested, or that he loved what he

loved as heartily as he hated what he hated. He accepted rather than sought the honours of office, from a desire for which he was removed both by his conception of his proper sphere in public life, and by his singular inaptitude for the details of business. In the fifty years over which his connexion with politics has extended a great change, and in most respects a change for the better, has come over England, and he has largely contributed to this change. The English people is now more numerous, better fed, better paid, a little more educated, and a little more intellectually alive than it was when Mr. BRIGHT was young, and Mr. BRIGHT has done much, so far as any one person can be said to have done much, to bring about this happy result. It is quite pardonable that, as he surveys in his old age what of good has been achieved in his day, he should somewhat exaggerate the share which he and his chosen associates have had in the work and good fortunes of a nation. To one of the chief apostles of Free-trade it is natural to ascribe exclusively to the triumph of his favourite measure the rise in wages which has been general even in rigidly protectionist countries. The habits and powers of mind and character which he actually possesses are all that any statesman can offer for the service of the nation; and if Mr. BRIGHT has often shown himself narrow and even unfair, it deserves to be recognized on fitting occasions how often he has shown himself generous, public-spirited, and sincere. It is not Rochdale alone that is ready to pay to Mr. BRIGHT such honour as is his due.

No public man has been more consistent than Mr. BRIGHT. He says and thinks now what he said and thought forty years ago. What he was, that he is; and if no one has changed less, no one has grown less. He began fighting, and he will end fighting; and if he cannot hear the din of battle, he cries out until he persuades himself that the battle is raging. He has never got out of the way of regarding men and classes with which he was possessed when he was fighting against Protection. To him the truths of Free-trade were as clear as the sun at noon, and wilful blindness was the only possible cause that he could conceive when they were not seen. The landlords resisted Free-trade, and their resistance could only be due to a monstrous and innate wrongfulness. Protectionists, he felt assured, could only be Protectionists because they were either very wicked or very imbecile. This conception of his opponents got into his mind, and nothing could ever get it out again. At seventy he is as perfectly sure as he ever was at thirty that every one who differs from him is either a fool or a knave, and he was delighted to be able to tell his friends of Rochdale that some Scotch farmers who share the preternatural shrewdness of their race thought on this head exactly as he did. To Mr. BRIGHT all Protectionists are fools, and all are English landlords. He remembers the weaker Englishmen with whom he once fought, and never troubles himself about THIERS and Prince BISMARCK. His opponents are always bad English noblemen, and their worse parasites, and the Protectionist manufacturers of America disappear from his horizon because Manchester was once the centre of the Anti-Corn Law League. Once an enemy always an enemy is Mr. BRIGHT's maxim, and he feels a virtuous pleasure and a renewed confidence in divine justice when he sees his enemy suffering. He was thrilled with the buoyant delight felt by the reader of a penny novel who reaches the point at which the villainous baronet is smitten down, when he could assure his Rochdale audience that there must be a great and general fall in rents. Nor must an enemy ever be allowed to claim or obtain justice. That landlords should ask for an inquiry whether they do not bear an unfair share of local taxation seemed to Mr. BRIGHT a piece of arrogant impudence. That in the long run they, and not the farmer, paid these taxes, whether fair or unfair, was quite enough for him. At the lowest he can regard them as a sort of war indemnity imposed on the class that he has conquered. The Church has been only a little less his enemy than the landowners, and he retains in old age the conception of the Church which he imbibed in the antagonistic home of his infancy. He has been young, and now he is old, and he still believes that the ties which bind the Church to the nation are chains forged by despotic monarchs and subtle statesmen and priests. Of no one was it ever more true than of Mr. BRIGHT that the child is the father of the man.

All his qualities—his true concern for the suffering, his earnestness in the expression of his convictions, his devo-

tion to what he terms the progress that is a change for good, his eloquence, his passion, his strange power of breathing new life into moral platitudes, and, at the same time, his pugnacity, his narrowness, his absolute want of elasticity—make up the Mr. BRIGHT with which Rochdale and England have been long familiar. He has brought into the sphere of English political life a new type of English statesmanship, and English political life is all the richer because it possesses this new type. There is nothing disrespectful, even in a moment when honour is being paid to Mr. BRIGHT, in saying that this type is in many respects imperfect. Most types are imperfect, because their limitations are inherent in their nature; and men of remarkable gifts have, as a rule, the defects of their qualities. They are contributions to the intellectual or moral wealth of a nation, not ideals or examples. England would be very dull if every town was a copy of Rochdale, and very destitute of political fertility if every statesman was moulded after the pattern of Mr. BRIGHT. This is not, of course, the way in which types look on themselves, or are looked on by the groups that are specially drawn to them. They are absorbed in a peculiar personality, peculiar aims, and peculiar convictions. Those who are outside cannot forget that they are outside, cannot forbear to apply the test to other standards, and cannot put aside the general history of the country. But this does not in any way prevent the recognition of excellence wherever it is to be found. And in one respect English political leaders are pre-eminently fortunate. They always obtain justice, and perhaps a little more than justice, in the long run. Their merits are remembered longer than their failings. Age, and still more death, softens the picture which their country draws of them. All that Rochdale could say for Mr. BRIGHT, and all that Mr. BRIGHT could claim for himself, will be much more present to the England of to-day, and to the England of some years hence, than what Rochdale did not say, or what Mr. BRIGHT showed in his manner of thanking Rochdale he could not claim. This habit of the national mind may perhaps be carried too far; but it springs from generous instincts, and to idealize departing or departed eminence is far better than wantonly to depreciate it.

#### SPAIN.

IT may be hoped that no serious dispute will arise between England and Spain with reference to the commercial or territorial claims of the North Borneo Company. Englishmen in general now for the first time hear of an enterprise which, on the showing of its promoters, appears to be legitimate in itself and conformable to precedent. It appears that certain potentates in the north-east of Borneo some time ago ceded to an American Company rights of trading with lands and harbours on which a settlement might be conveniently made. The concession appears not to have been worth even the limited sum for which it was exchanged. The American adventurers may or may not have paid the stipulated price; but they were either unwilling or unable to prosecute the undertaking. Ultimately they disposed of their interest to an English Company principally formed of persons interested in the trade of China. The native rulers have confirmed or renewed the former concession, and the Crown has granted the Company a charter. Such an act of Imperialism would have been indignantly denounced in Lord BEACONSFIELD's time; but it must be assumed that whatever is done by Mr. GLADSTONE and his colleagues is right, and it is satisfactory to find that the expansive tendencies of the English nation are not yet exhausted. Similar Companies have in former times laid the foundation of English sovereignty in many parts of the world. Only two or three years ago Mr. GLADSTONE lamented that the New Zealand Company had in the last generation virtually compelled the Government to form the islands into an English colony. The substitution of a flourishing and civilized community which will hereafter number millions for a scanty population of cannibals naturally appeared to Mr. GLADSTONE an inadequate return for even a moderate expenditure of money. It is not known whether at a later period he shared the violent indignation of Mr. CORDEN and Mr. BRIGHT against Sir JAMES BROOKE's establishment at Sarawak. A possible extension of English trade and influence in another part of the great island of Borneo might, if the charter had not been granted, have been

thought incompatible with the policy of the present Government.

It seems that the Spaniards, who have large interests in the Malay Archipelago as owners of the Philippine Islands, formerly made a treaty with the Sultan of Sulu, who is one of the vendors under whom the North Borneo Company claims. No Spanish grantee has taken possession of any territory which may have been nominally ceded; and it is not impossible that the same lands may have been sold twice over. Uncivilized despots are not always careful to distinguish between property and sovereignty, and their registers of title are imperfectly kept. Thirty or forty years ago it pleased Lord PALMERSTON to maintain or recognize a potentate in the neighbourhood of Honduras who was called King of the Mosquito Coast. An English Consul-General who assisted him in the exercise of his authority could not prevent him from alienating whole provinces to English masters of trading vessels, who invited him on board for the purpose of plying him with whisky and brandy. The donees found a difficulty in reducing their grants into possession, as there were neither maps nor laws of real property in the Mosquito country, and as the same lands were generally sold or given to the latest comer, without regard to former conveyances. Ultimately the Government of the United States, which had never recognized the Mosquito King, induced Lord PALMERSTON or his successors to abandon the fictitious monarchy; and the numerous claimants found that their grants were worth less than the modest price which they had paid in the form of spirituous liquors. It would seem a proper subject of diplomatic ingenuity to adjust by some reasonable compromise the respective claims of Spain and England in Borneo. The Sulu SULTAN has no reasonable pretension to the sovereignty of the whole island, and there must be room for the trade of more than one European country. If international law were consistent with natural justice and with common sense, all civilized States would promote, as far as possible, the extension of the only hospitable Empire in the world. English Crown Colonies are open to the trade of all nations, while other States found or keep colonies for the sole purpose of exercising commercial monopoly. It is only when responsible government and democracy supersede Imperial administration that ignorant selfishness takes the place of national policy.

It is the more desirable to avoid any occasion of quarrel with Spain, because there seems to be some hope of an improvement of commercial relations. The present Government, for the first time in many years, inclines to reduce the tariff; and it is understood that the restrictions on English commerce would be relaxed if some concession were made to the reasonable or plausible demands of the Spanish wine-growers. If the negotiations with France should fail to result in the conclusion of a commercial treaty, some alteration of the wine duties would almost certainly follow. On the other hand, a stipulated reduction of the duties on French wines would not prevent the reconsideration of the theory which has operated unfavourably to Spanish and Portuguese produce. The alcoholic test, or rather the scale on which it is applied, has never formed a part of the agreement between England and France. From 1860 downwards the English Government or Parliament was always at liberty to alter or abolish the scale, which has indeed been maintained by Mr. GLADSTONE, or in deference to his authority by Ministers of the opposite party. From time to time Mr. GLADSTONE has contended that the receipts from duties on spirits would be injuriously affected if advantages were given to the alcoholic element in Spanish wines. Many wine-merchants and other firms professionally acquainted with the subject-matter have differed from Mr. GLADSTONE; and the Spanish Government has uniformly regarded the differential duties as a serious grievance. It is of course an error to suppose that the privileges accorded to light Bordeaux wines are in any degree due to a preference for French over Spanish interests; but the impartiality of English legislation is doubted in Spain. Large quantities of light Spanish wines are imported through France under a fictitious name at the lower rate of duty. Unskilled critics cannot speak confidently on questions which require technical knowledge for their solution; but opinion seems to incline more and more to acquiescence in the Spanish demands, especially as greater alcoholic strength is not necessarily coincident with superior quality or higher value. As long as the test is maintained it will be im-

possible to convince Spanish negotiators that a larger duty on Spanish wines is consistent with the treatment which is measured by the benefits conferred on the most favoured nation.

Independently of commercial interests, the feeling of England to Spain is neither unfriendly nor disrespectful. Since the restoration of the BOURBON dynasty the country has been uniformly tranquil, and there has been a considerable advance in material prosperity. Contrary to expectation, the insurrection in Cuba has been finally suppressed; and domestic factions have suspended the hostility with which in former times every successive Government was assailed. The advance in political wisdom is faithfully represented and forcibly expressed by the most eloquent of living Spaniards, who has proved his political aptitude by the lessons which he has drawn from experience. Señor CASTELAR was a passionate advocate, not only of the Republican doctrine, which he still holds, but of the expediency of overthrowing monarchical institutions at the earliest opportunity. When unexpected events made him for the time chief of a Republican Government, he at once discarded prejudices which he found to be incompatible with the welfare of the State. Having for a few months ruled as dictator, he has ever since been the chief of a constitutional Opposition. In a late speech he told his party that they must pay the penalty of their refusal to obey, during the continuance of the short-lived Republic, their own chosen leaders. "You would not," he said, "support MARGAL, and now you must submit to SAGASTA." A more general proposition was enforced by an admirable illustration. "Liberty," said CASTELAR, "is like food, but order is the air which we breathe. With insufficient food, or even without food, a man may linger for days, but in the absence of air his life is measured by seconds." It will be a cause for regret if a man of genius and of unimpeachable honour is permanently deterred from taking part in the government of his country by any prejudice against monarchy. If Spain prefers a monarchy to a republic, refusal to acquiesce in the claim of a majority is a mere superstition.

#### THE ST. PAUL'S INDUSTRIAL SCHOOL.

THE relations of the London School Board with the St. Paul's Industrial School, the degree in which the Board were bound to inquire into the management of the school, and the zeal or want of zeal which they displayed in the discharge of such duties as did devolve upon them in this respect, are points which have been fully brought before the public during the past week. The two extreme views upon the first of these points are represented by the Chairman of the Board on the one side and the HOME SECRETARY on the other. Mr. BUXTON contends in word, though not in deed, that the St. Paul's School was not under the Board, that its managers have not been appointed by the Board, and that generally the Board has no more control over this particular school than it has over the forty-seven other industrial schools to which the Board sends children. The HOME SECRETARY replies that the St. Paul's School was in everything but name, to all intents and purposes, a School Board school. It originated in the School Board; most, if not all, the original managers were members of the School Board; of late years the Chairman of the Industrial School Committee of the Board has been the sole manager of the school; and all, or almost all, the children at the school were sent there by the School Board. Mr. BUXTON has conceded quite enough to saddle the Board with a very grave responsibility when he says that the St. Paul's Industrial School stands in the same relation to the Board as any other of the forty-seven industrial schools to which the Board are in the habit of sending children. He will hardly contend that, if in his private capacity he were guardian to a friend's children, he would be under no obligation to satisfy himself as to the truth of grave charges brought against a school in which he had placed them. The London School Board stand to the four thousand children of whom they have taken the charge in the relation of guardian to ward. These children have not been thrown upon their hands by chance. If they had been orphans or deserted children, they would have been taken possession of by the Guardians of the Poor. They are, for the most part, children who have parents or other relatives alive; and the School Board have withdrawn them

from the care of these parents and other relatives and sent them to an industrial school, in many cases for no reason except that they have played truant. We contend, therefore, that, if charges of cruelty are alleged against any one of the forty-seven industrial schools to which children are sent by the London School Board, it is the duty of the Board to satisfy themselves whether these charges have any foundation. If Mr. BUXTON had placed some orphan nephews at school, and heard that they were being ill-treated there, he would scarcely hold himself exempted from any obligation to make inquiry by the circumstance that the school was a public school or a grammar-school, and we fail to see why the London School Board should be excused from the same obligation by the circumstance that an industrial school is a voluntary school. The question is not what sort of school an industrial school is, but whether it is a school to which the London School Board is in the habit of sending children for whose proper bringing up it is responsible. If it is, the responsibility of the Board does not end when they have transferred these children from their own control to that of the school managers. They are bound to remove them if they have any reason to be dissatisfied with the treatment they receive there; and, if they turn a deaf ear to any accusations that may be brought against the school, they cannot possibly know whether they have cause to be satisfied with the treatment or not.

In what way the duty of the School Board towards these children could be best performed was a different question. There was much to be said in behalf of the proposal to refer the matter to the HOME SECRETARY, and much in behalf of the resolution of the Board to institute an inquiry on their own account. The School Board were apparently unwilling to carry out either course to its natural conclusion. They did, it is true, pass a resolution on the 6th of October which in effect laid the burden of making inquiry on the Home Office, and they must by this time have had ample cause to regret that they did not leave matters in this position. At the next meeting, however, they rescinded this resolution, and undertook an inquiry on their own account. This change of front seems to dispose of the later contention that the majority of the Board were of opinion that the matter was one belonging to the HOME SECRETARY and not to the Board. On the 13th of October the HOME SECRETARY was actually seized of the business by the vote of the Board on the previous Thursday. If the Board thought that the HOME SECRETARY was the proper person to conduct the inquiry, why did they show such anxiety to take the matter out of his hands? The answer to this question has been supplied by the letters from Mrs. FENWICK MILLER on the one side and Miss SIMCOX on the other, which have appeared in the *Times*. It is plain that Mrs. SURE, by whom the charges against the school were brought, belonged to an unpopular minority, and that Mr. SCRUTTON, at whom, in his capacity of sole manager of the school, the charges were virtually levelled, belonged to a popular majority. No one supposes that, if the members of this majority had discovered the condition of the school for themselves, they would have been less anxious to set things to rights than the members of the minority. What they could not endure was that the discovery should have been made by the wrong people. Let it be granted, however, that the minority in which Mrs. SURE is included deserves the dislike in which it is held by the rest of the Board, and that the motion asking the HOME SECRETARY to take the school in hand was carried—as indeed it is pretty clear from Mrs. FENWICK MILLER's letter that it was—by a bit of sharp practice. This does not alter the fact that, in this particular instance, the unpopular minority was in the right, and that the motion which was only carried by an accidental majority—obtained after the greater part of the members had left the room—was a motion which the Board would have done well to vote unanimously. So anxious, however, were the Board not to have any hand in invoking the action of the Home Office, that on the 13th of October they actually took the trouble to rescind the motion which had been carried the week before, though they had already heard from Mr. LUSHINGTON that the inquiry had been ordered before the arrival of their letter. Thus, as Sir WILLIAM HARCOURT puts it, "the majority of the Board determined to take the matter into their own hands, and themselves to undertake an investigation . . . at the very time that the Home Office had completed its inquiry, and

"recommended the dismissal of the Superintendent, and the reconstitution of the management." If, as Mr. BUXTON contends, it was the business of the HOME SECRETARY, not of the School Board, to investigate the charges brought against the school, why did the Board undertake to do the HOME SECRETARY'S work after the HOME SECRETARY had done it for himself? Mrs. SURR says plainly that it was done "in the hope of clearing Mr. SCRUTTON from the charges brought against his management." She may have mistaken the motive which determined the action of the Board; but, if the Board had wished to give probability to her suggestion, they would only have had to do what they did.

When the Board had made up their minds, for whatever reason, to institute an inquiry of their own into the condition of the school, it might have been thought that they would at least make the investigation complete. This, at all events, was not the view of the Chairman. He draws a distinction between the two objects for which such an inquiry might be instituted, and contends that since what was wanted was reformation, not punishment, there was no need to go on raking up old abuses when once the necessity of some change had been admitted, even by Mr. SCRUTTON himself. We cannot agree with Mr. BUXTON in thus excluding punishment from the ends to be answered by inquiry. On the contrary, the punishment of the Superintendent, supposing that punishment to be deserved, is one of the surest ways of guarding against the repetition of these abuses. Mr. BUXTON is no doubt right in saying that the School Board is not a convenient body to put the Public Prosecutor in motion. But after the HOME SECRETARY had made his inquiry, and had ordered the Superintendent to be dismissed, and the school to be reorganized, reformation was already assured. Either, therefore, there was no good reason why the inquiry should have been begun, or there was no good reason for the Chairman's desire to bring it to a premature end. Except, however, from the point of view of Mr. BUXTON'S reputation for sound logic, it matters very little whether the School Board continue their inquiry or retire from it. The person whose intervention is really needed is the Public Prosecutor. There can be little question that his appearance is only a question of time. If the Superintendent has a good answer to his accusers, a court of justice is the place in which that answer would be most naturally made. As regards Mr. SCRUTTON, he is probably only an unusually striking example of a not uncommon temper. He has supposed that good intentions and readiness to believe what his subordinates tell him are sufficient to make a man a competent manager of an industrial school. That he was satisfied alike with the condition of the school and with his own relation to it is shown by the fact that for years past he has called no meeting of the managers, if, indeed, there be any managers besides himself. He has now apparently seen that, with this grave charge of neglect of duty hanging over his head, he ought not to remain the Chairman of the Industrial Schools Committee of the Board; but the strangest thing in the whole business is that if Mr. SCRUTTON had not made this discovery himself there is no reason to suppose that the School Board would have made it for him.

#### THE INDIAN COTTON DUTIES.

THE Governor-General of INDIA is at present engaged in making his autumn progress from Simla to Calcutta, visiting by the way such of the principal places of interest as are easily accessible from the direct line of route, and "interviewing" native chiefs, while the members of his Council and the several departments of the Secretariat are taking up their quarters at the capital and preparing for the winter campaign. A considerable proportion of the most important business bearing upon the internal administration of India, and the greater part of the legislation, though much of it is worked up at Simla, is reserved for final disposal at Calcutta; and among the matters which are invariably settled at the latter place are the annual financial estimates, which, whether they involve discussion in the Legislative Council, or whether they are merely promulgated in the form of a Resolution of the Governor-General in Council, are justly deemed to be a branch of public business which can be most fitly dealt with at the commercial capital of the Empire. In

these circumstances it is perhaps not surprising that the Manchester Chamber of Commerce should have deemed the present to be a suitable time for addressing to the Secretary of State for INDIA their annual representation on the expediency of repealing the remainder of the import duties still levied in India upon cotton goods. The reports of the speeches made by the deputation which was received by the SECRETARY of STATE at the India Office on the 11th instant are not very full; but they are sufficiently so to indicate the main lines of argument used on the occasion. The stereotyped assertions as to the boon which the entire removal of the duties would confer upon the people of India, as well as upon the manufacturers of Lancashire, by cheapening the price of the goods to the purchasers, and by imparting a fresh stimulus to commerce, were not omitted; nor did the deputation forget to remind the SECRETARY of STATE that he stood pledged by his speech on the Indian Budget in August last to get rid of the whole of the duties at the earliest possible date. On the main question of the policy of repealing the duties there was no difference of opinion between the deputation and the SECRETARY of STATE. Lord HARTINGTON was not less emphatic than the members of the deputation in affirming that the repeal of the obnoxious taxes was as certain to conduce to the interests of India as to the interests of Lancashire. Indeed it is somewhat difficult to reconcile the SECRETARY of STATE'S utterances on this point with his evident reluctance to commit himself to an early repeal of the duties upon any of the descriptions of goods at present liable to duty other than what are called grey goods. It was obviously right and proper that he should reserve to the Government in India a very full discretion as to the time when it will be financially possible to dispense with the whole of the duties, and therefore he would perhaps have been more prudent had he abstained from committing himself so unreservedly to the position that the repeal of the duties is a measure which is demanded in the interests of the people of India.

In connexion with this question of the economic value to India of the proposed repeal of the duties on cotton, Lord HARTINGTON made some remarks which indicate a misapprehension of facts. He spoke of the impression which for some time past has prevailed in India that the remissions of taxation on cotton goods made in 1878 and 1879 were brought about entirely by the pressure exerted upon the Government of the day by the manufacturers of Lancashire; and then, arguing as if the impression to which he referred, and the opposition which has been offered in India to the repeal of the duties, were entirely attributable to the prevalence of Protectionist opinions in that country, he proceeded to apologize for the existence of such opinions there by observing that when such strange economical doctrines are promulgated in this country, it is not a ground for surprise that public opinion in India should have failed as yet to detect the fallacies of Protection. The answer to these remarks is a very simple one. The particular phase of public opinion to which Lord HARTINGTON refers, and which he deems to be in some degree excused by the remoteness of India from the great centre of Free-trade, has really no prevalence there. As a matter of fact, the great majority of the persons who guide public opinion in India have no sympathy with Protection, and are quite as sound in their economic views as are the majority of those who, during the last five-and-thirty years, have guided public opinion in this country. It is very probable that the owners of the cotton mills at Bombay would like to retain the duties as a protection to their own manufactures, and it is possible that during the last few months the unwise attempts which have been made in various quarters in this country to revive Protection under the guise of Fair-trade may have tinged the writings of the half-educated natives who for the most part conduct the vernacular newspapers in India. But it cannot be said with any sort of reason that the opposition which during the last five years has been offered in India to the repeal of the cotton duties, and which indeed was led by Lord HARTINGTON'S colleague, the Earl of NORTHBROOK, has had any connexion with Protectionist views or theories. Public opinion in India—at all events that public opinion which makes itself heard in this country—is the opinion of the English officials, of the English merchants and barristers and other professional men, of the Anglo-Indian press, and, to a limited extent, of the educated classes of the native community. The general tendency of

that opinion is certainly not to run counter to views generally accepted by English statesmen and economists. The danger usually lies the other way—lest views and opinions and systems suitable for a free country should be indiscreetly applied to a country in which all the conditions are so essentially different. Sir THOMAS MUNRO's remark, penned sixty years ago, that "Every man writes as much 'as he can and quotes MONTESQUIEU and HUME and ADAM SMITH, and speaks as if we were living in a country 'where people were free and governed themselves,' is not entirely inapplicable to some, at all events, of the English officials in India of the present day. And as to the English merchants in India, their personal interests are so entirely opposed to the retention of any duties on British goods of a really protective character, that when we see them opposing the repeal of import duties, as was done by the Chambers of Commerce at Calcutta and Madras in 1879, we may be certain either that the actual injury to trade caused by the duties has been so far inappreciable, or that the objections to dispensing with them are such as to outweigh the advantage of the relief to trade. The latter was the view taken by the members of the Governor-General's Council who dissented from the reduction of duties carried out in 1879. One of these gentlemen expressly guarded himself against the imputation of sympathising with "any form of taxation in "India which operates in defiance of the fundamental "principles of British commercial policy, and fosters "local industries by restrictions on other classes of Her "MAJESTY's subjects," basing his opposition to the repeal of the duties entirely on the financial exigencies of the time and on the danger of exciting political discontent by parting with a source of revenue which was not unpopular, with the certainty of having to substitute for it at no very distant date some unpopular form of direct taxation. The other dissents proceeded upon very similar lines, only one of them, that of Mr. WHITLEY STOKES, indicating the slightest tendency to support the duties on the ground of protection; and even here the sort of protection which was incidentally referred to was protection, not against low prices, but against adulterated goods. But this argument found no echo in the Minutes of Mr. STOKES's colleagues, who considered a financial year in which the estimated receipts fell short of the estimated expenditure by more than a million to be an unsuitable time for "parting with or reducing any source of revenue which "is so easily realized as the import duty on cotton goods."

The Marquess of HARTINGTON did not fail to condemn the inopportune of the measure ordered by his predecessor, but he omitted to state the real reasons which rendered that measure inopportune; and he passed on at once to the difficulties with which the Government have to contend, owing, as he implied, to the heterodox opinions prevalent in India on the subject of trade. It is not improbable that this view of the case has been impressed upon Lord HARTINGTON's mind; for a suggestion that the whole of the opposition in India to the repeal of the duties originated in protectionist views was put forward at the India Office during the controversy in 1879, although a majority of the Secretary of State's Council on that occasion joined with the dissentient members of the Governor-General's Council in disapproving the action of the Viceroy. But the suggestion is at variance with the facts, and ought not to mislead any one who has studied the history of the question. The truth is that in this matter the leaders of English politics on both sides, acting in deference to what they regard as the exigencies of their respective parties, have taken a course which no prudent statesman would have adopted who considered himself free to deal with the question on its merits. The Indian duties on cotton goods are evidently doomed. The resolution which has just been issued by the Lieutenant-Governor of Bengal, as announced in the *Times*' telegram on Monday last, shows that the duties on grey goods cannot be retained in their present form. The remainder of those duties will probably be swept away in the next Budget; and, if we may judge of the future from the experience of the past, it is not unsafe to affirm that the surrender of the duties upon the higher classes of goods, to which at the present moment no protective character can be justly assigned, is merely a question of time. With these last-mentioned duties will probably disappear the remainder of the import duties upon other articles of commerce. The meaning of all this is to cut off from the receipt side of the Indian Budget a

source of income which a few years ago yielded an annual revenue of two and a half millions; and if in a few years more the abolitionists of the opium trade are allowed to have their way, the Indian Finance Minister will find his revenue diminished altogether by a sum not far short of eleven millions. These are serious considerations. They seem to us to show that, whatever may be the merits or demerits of the PRIME MINISTER's "Hands Off" policy in connexion with foreign affairs, it might be most expediently applied to all future assaults upon the Indian Exchequer.

#### NEW PUBLIC OFFICES.

THE public will be apt to receive the announcement that it is really in contemplation to provide a fresh block of the permanent concentrated Public Offices with the incredulity naturally engendered by a quarter of a century of promise, procrastination, postponement, and ruinous makeshift. Even the present movement has to appeal for its justification to the Report of a Select Committee now four years old, and due to Mr. BAILLIE COCHRANE, in the days of those scapegrace Tories, when the death of Sir JAMES LINDSAY and the dangerous illness of Lord EUSTACE CECIL had concentrated a little languid attention on the sanitary shortcomings of the War Office in Pall Mall. If the condition of the War Office as exposed by that inquiry justified the worst surmises, an equally disgraceful state of things was shown to exist at the Admiralty, which had long overgrown its stately, but inconvenient, House of Pillars in Whitehall; and, after having established and disestablished a colony in Somerset House, had annexed, with a due regard to their especial unsuitability for official purposes, a whole town of private houses in Spring Gardens.

So it is a War Office and an Admiralty which we are now to have, and Mr. LEFFEVRE deserves much commendation for reaching this conclusion. Mr. COCHRANE's Committee abstained from pledging itself to a special site; but the drift of its Report virtually left the choice open between two, either of which, after those long years of waiting, the United Services and the public in general would very thankfully accept from a paternal Government. One was the familiar Great George Street site, reaching up to the new Foreign Office, at which so many successive Governments have been nibbling in the way of petty purchases made in the most expensive happy-go-lucky fashion which officialism could devise. The other one, also in the neighbourhood of Whitehall and of St. James's Park, may be generally described as the actual Admiralty, with its curtilage, comprising the beehive of temporary offices about Spring Gardens, and reaching up to BIDDULPH's Bank. The last-named area is the one selected for the two offices, which will thus be constructed in proximity to each other and to the Horse Guards; the War Office immediately adjoining the latter, and the Admiralty standing to the northward. In passing, let us drop a word of congratulation on the collapse of the mischievous delusion which was at one time egging our authorities on to the resolve of building at least the War Office upon the Embankment at the bottom of Whitehall Place.

The official announcement which has been sent to the newspapers concludes with a sentence which has, we conclude, been modelled, as far as the difference of language permits, upon M. GAMBETTA's programme. "It is intended "that the architectural features of the new building shall "be subordinate to its main purpose of a great public "office, and not the determining course [cause] of its "terior arrangements; but the frontage to Whitehall, and "to the Parade, and that looking up the Mall, will afford "opportunities for well-proportioned and handsome "façades." This rather meaningless outburst of pompous commonplaces has put the *Times* into a condition of hilarious excitement so dangerous as absolutely to impair our contemporary's memory—we hope not for long. "Lord "PALMERSTON," it exclaims, "was amply justified in declaring that he would 'have nothing mediæval' when "the new Foreign Office was built; and Mr. BAKER's building, though it is open to criticism on many grounds, "is at least not absurd." This is pleasant news from Fairyland; but the whole world, we should imagine, with the one exception of the *Times*, knows that the Foreign Office was not built by Mr. BAKER, but by Sir GILBERT

**SCOTT.** The story of the Battle of Styles over that architect, whom both sides accepted, and who was willing, with differing feelings, to serve either, is not so obscure nor so very far off as to have become one of the things which had better be forgotten by the critic who claims to instruct us in the history of London architecture.

In itself the statement involves so obvious a truism as to lead to the well-grounded inquiry, why was it put there? Every Minister, every Committee of Judges, and every architect who has ever been concerned about any public building has pronounced, and we have little doubt in good faith, that the main purpose of that building should be its "determining course [cause]." Successive conditions of competition or tender for offices or law courts have been burdensomely fussy on this head, and if the result has not in all cases responded to the trouble taken, the misadventure must not be sought in the deficient good will, but in the incapacity of those who were responsible for the failure. Why, then, this superfluous profession of good intentions which no man was prepared to challenge? The virtue is too ostentatious not to be suspicious, and the declaration, coming from official lips, too goody not to lead to the inference that something unexplained must be lurking behind. Cynical bystanders who think they can read between the lines may be tempted to offer their revised version of the paragraph in these terms. "The offices will be planned and carried out by the officials of the department, without inviting the aid of any trained and eminent architect, and then it will be easy to stick some details taken from the stock books kept in the office upon the two principal fronts." People have not, we hope, forgotten the Post Office fiasco, when the gigantic annexe provided on the other side of St. Martin's-le-Grand by the official surveyor proved to be so deplorably commonplace and ugly that Mr. FERGUSSON was called in in hot haste to overlay it with something deserving of the name of architecture. The world has been moving fast since those days, and the time may have come when it was considered safe to adventure a similar experiment on public patience.

#### SMOKE.

**THE** Exhibition of smoke-consuming apparatus which has so long been promised will soon be opened, and this prospect gives unusual interest to part of Sir FREDERICK BRAMWELL's address as Chairman of the Council of the Society of Arts. There is no question upon which it is more necessary to be sure of the facts before attempting to deal further with it by legislation. Nothing would be gained by adding another example to the list already too long of statutes which enforce directions which are not obeyed by penalties which are not inflicted. If we wish to avoid this, we must be very careful not to rest the case on wrong grounds, or defend a smoke-prevention Act by arguments derived from a state of things which exists only in imagination.

Sir FREDERICK BRAMWELL dismisses very peremptorily the common theory that, if manufacturers did but know their own interest, they would make their furnaces consume all the smoke they produce. This notion rests on the supposed fact that, if a manufacturer allows smoke to escape from his chimney, he must be wasting a large quantity of solid fuel. Instead of passing into his furnace as heat it passes into the atmosphere as smoke. Some slight doubt has always rested upon this statement, since, if it were true, it is strange that so few manufacturers should be sufficiently alive to their own interest as to introduce the necessary improvements into their furnaces. When all allowance has been made for the difficulty of getting sufficiently intelligent men to feed the new apparatus properly, and for the higher wages which a careful stoker would be able to command, it seems hardly likely that, if there were nothing but the ordinary dislike of change to be overcome, more manufacturers would not have been found to try the experiment. Sir FREDERICK BRAMWELL makes it clear why they have not done so. The prevention of smoke depends almost universally on a very free admission of air above the fuel. When this is secured, the combustion of smoke will be easy; but it is by no means certain that by this means an unnecessary amount of air will not be passed through the fire. In this way the manufacturer would undoubtedly save the few pounds per ton of unconsumed

carbon which now pass into the air as smoke; but in doing so he would sustain a much greater loss of heat. Consequently Sir FREDERICK BRAMWELL is not at all sure that a manufacturer who declines to alter his furnaces, and risks all the penalties the law can denounce against him, is so great a fool as is commonly thought. He would not get as much heat from his coal by the new apparatus as he gets from it by clinging to the old. He would burn up every atom of the coal he uses, instead of, as now, allowing a fraction to escape unconsumed; but the heat produced by the coal thus thoroughly burnt up would be less than that produced by the imperfectly consumed coal.

This is certainly bad news for all of us who are not manufacturers. So long as it could be pointed out to manufacturers that it was their own pockets, not the lungs or eyes of their neighbours, that they were asked to think of, there was at least a chance that the desire to save money would in the end overpower the dislike to change which makes even the substitution of new furnaces for old a matter of genuine annoyance. But, if Sir FREDERICK BRAMWELL is right, the appeal to self-interest must for the future be given up. The manufacturer who consumes his own smoke may be more patriotic and disinterested than his neighbours, but he is not necessarily wiser than they. Consequently, when the Legislature insists upon his making such alterations in his furnaces as will prevent the smoke from passing unconsumed into the air, it is not simply compelling him to consult his own pocket. Instead of being in the end a richer man for obeying the law, he may really be a poorer one. We do not say that the Legislature ought for that reason to forego making its appeal. A man has no right to create a nuisance because he is richer by reason of it. The question is really one of degree. The point to be considered is whether the gain to the community will be greater from the suppression of the nuisance or from the continuance of the industry which gives rise to it. There are trades so important that the country cannot afford to see them hampered by the restrictions which can alone make them really harmless. For example, Sir FREDERICK BRAMWELL told the Society of Arts that the by-products of gas manufacture are becoming so valuable that it will shortly become doubtful whether these products should not be considered as the primary object of manufacture, and the gas itself as the by-product. In dealing with an industry of which this can be said, it is plainly impossible to think only of the persons who are annoyed by the smoke given out in the production of gas. Some process of give and take must be resorted to which may ensure that, if the smoke cannot be altogether done away with, it shall at least be brought within due bounds. The more difficult, however, it is found to interfere with existing industries, the more essential it is not recklessly to increase their number. The injury done by the introduction of smoke, or of the chemical vapours which are often far worse than smoke, into a neighbourhood which has hitherto been free from them, is far greater than can be done by their multiplication in a neighbourhood which is already familiar with them. In the latter case the inhabitants are in a measure acclimatized to the nuisance, and they have often gone to live in the district of their own free choice. In the former case the evil comes upon temperaments that have not been trained to endure it, and upon people who have fixed themselves in the district with no thought that it would be polluted in this way. It would be no hardship for Parliament to say that no manufactories shall be set up in a neighbourhood where they do not already exist, unless the owners would consent to use the most effective apparatus for consuming their own smoke. In this way, if the law did nothing to clear the sky or restore vegetation, it would, at all events, do nothing to destroy them where they are still to be found.

As regards domestic fires, Sir FREDERICK BRAMWELL alleges another objection to the use of smoke-consuming grates. In a dwelling-house he seems to think that the alternative lies between close stoves and open fireplaces, and he gives a weighty reason for preferring the open fireplace to the close stove, notwithstanding the injury which its employment inflicts upon the atmosphere. "The natural man," he says, "especially if he is poor, sparingly fed, and insufficiently clothed, objects to ventilation because he fears draughts." With an open fire he must have at least so much ventilation as will allow the smoke to go

up the chimney. If he used a close stove, he would be able to close up his rooms much more completely against draughts, and the more accustomed he grew to the greater heat thereby produced, the more disinclined he would be to lessen it by letting in the outer air. Sir FREDERICK BRAMWELL maintains that the inhabitants of London, smoky as the air they breathe may be, have a healthier look than the inhabitants of cities where the atmosphere is far clearer, but where, from the use of close stoves, there is no efficient ventilation. If we can get a clear atmosphere with ventilation, by all means let us have it. But, if the choice lies between breathing abundance of smoky air and breathing very little clear air, Sir FREDERICK BRAMWELL is in favour of the former alternative. It is an original and suggestive way of stating the case, and it is to be hoped that the Exhibition which is shortly to begin may produce some invention which, while preventing the waste of fuel in domestic grates, may not sacrifice the free ventilation which that waste has hitherto secured.

#### ROSMINI.

IT is certainly strange, as a writer in the *Fortnightly Review* observes, that the life of so remarkable a man as Antonio Rosmini should have remained till now unwritten. It is no doubt partly due, as he suggests, to the fact that Rosmini, while conspicuous alike as a patriot, philosopher, and Church reformer, "had the misfortune to be, on the one hand, a Catholic priest; and, on the other, an Italian"; while moreover he incurred, as a Catholic priest, the suspicion of Italian patriots, and as a liberal and reforming priest the more than suspicion of the party headed by the Jesuits and their friends which was dominant in the Church under the late Pope. To these more general drawbacks may be added, as helping to account for his name being so little familiar in England, that philosophical speculation does not usually attract any special interest, for its own sake, in this country, and it is chiefly as a philosophical thinker that Rosmini will be permanently remembered beyond the limits of his own communion. We believe it is true, though Mr. Davidson, the author of the article referred to, does not say so, that an English translation of his more important works is now in course of preparation by members of his Order, and this when completed will no doubt both deserve and command the attention of competent critics. Meanwhile there is much worth noting in the character and career of Rosmini, apart from the twenty-four bulky volumes, the various essays and ascetical works, and the 10,000 letters which attest his literary activity. In the immediate objects to which his life was devoted he must be said in the main to have failed, though his failure may well be counted preferable to what many men would deem success; how far his wider schemes for renewing the intellectual and moral energies of his Church may yet bear fruit it would be premature to determine. In some respects his position may seem to bear a superficial resemblance to the later experiences of Father Curci, but there is little really in common between them beyond an earnest and honest desire to promote the cause of spiritual progress and reform. Curci during the greater part of his life was a Jesuit of the most reactionary type, and for many years conductor of the *Civiltà Cattolica*, whereas Rosmini had been from his boyhood a keen philosophical inquirer, and entered the priesthood with the deliberate aim of doing all that in him lay to reform abuses in the current theological teaching and political action of the Church. At the same time he was from first to last strictly submissive to ecclesiastical authority; and while he desired the unity of Italy, according to his own programme, was not prepared to contemplate the sacrifice of the temporal power of the Pope, though it is of course quite possible that further experience and observation—he died in 1855—might have materially modified his views on this and other political questions of the day. But his great object was to penetrate to the fundamental principles of political no less than of philosophical and theological science, and among his earliest essays were those eventually amplified into the two large works on the *Philosophy of Right* and the *Philosophy of Politics*. But for any practical application of his principles whether in Church or State he was dependent on the concurrence—which at one time he had good grounds for reckoning upon—of Pius IX., and it is not the least part of the interest attaching to his chequered course that it sheds so curious a light at once on the better and the worse side of the peculiarities of that strange pontificate.

Antonio Rosmini was born of a noble Italian family, at Rovereto in the Tyrol, in 1797, and was therefore nearly fifty years old at the accession of Pius IX.; but his previous life had been very far from an inactive one. He was ordained priest in 1821, and for several years before and after his ordination devoted himself to the diligent study, not only of Christian fathers and schoolmen, but of the Greek philosophers, and of such modern authorities as Leibnitz, Kant, Fichte, Schelling, and Hegel among the Germans; Descartes and Condillac among the French; Reid, Stewart, and Locke among English writers. In 1826, when in his thirtieth year, he removed from Rovereto to Milan, in order to take steps for beginning his great work, which comprised, as we have seen, the

intellectual reform of the current theological education by supplying for it a sounder philosophical basis, and the ecclesiastical and political regeneration of Italy and of the Church, which last design was to be aided by the institution of a new Order, destined to serve as the leaven of future society. During his two years at Milan accordingly he published the first of his *Opuscoli Filosofici*, and took counsel with his energetic friend and coadjutor, Father Löwenbruck, as to the foundation of the contemplated Order. From Milan he went in 1828 to Domodossola, where there is now one of the principal houses and noviciates of the "Institute of Charity," as it is technically termed, and stayed several months there in almost entire solitude, which he employed in drawing up his Rule and continuing his philosophical labours. To Domodossola he again returned in 1830 after spending a year and a half in Rome, where he received friendly welcome and encouragement from the successive Popes Leo XIII. and Pius VIII., and formed an intimate acquaintance with Cardinal Cappellari, afterwards Gregory XVI. His reputation was at once established by the appearance during this period of his *New Essay on the Origin of Ideas* in four volumes, which soon became a text-book in ecclesiastical seminaries, even those conducted by the Jesuits, who had not yet seen reason to suspect the heretical virus which they found it convenient later on to discover there. The new Order was regularly founded and domiciled in 1830, both at Domodossola and Trent, by invitation of the Bishop, though not yet formally approved at Rome. But in proportion as Rosmini became better known, his reforming zeal roused the suspicions of the Austrian Government, and in 1837 he removed to the lovely village of Stresa, on the Lago Maggiore, in Italian territory, where a large house of his Order still crowns the hill. Two years later the formal authorization of the Holy See was accorded to his new Society. For the next ten years there was little to disturb the even tenor of Rosmini's life and literary labours, except the somewhat vehement attack of Gioberti on his "philosophical errors," to which he replied with force and dignity. But in 1848, the year of revolutions, the final and most troubled period of his life began. Hitherto he had studiously avoided or declined all ecclesiastical preferment, nor had he ever cared to remind his old and intimate friend Pope Gregory XVI. of his promise to give him a house for the Order in Rome. But now Gregory XVI. was gathered to his fathers, and a new Pope, the idol of young Italy, and seemingly the very man to carry out Rosmini's projects of liberal reform, reigned in his stead. When, therefore, he was requested by Cardinal Castracane to draw up a plan of a Constitution to be submitted to the Pope, he did not hesitate to respond to an invitation so entirely harmonizing with his own strong belief in the merits of constitutional government.

It is not necessary to examine in detail here the form of Rosmini's *Constitution in Accordance with Social Justice*, with an appendix on Italian Unity, which never attained even a passing historical importance, as Pius IX. had already, before receiving it, granted a Constitution to his subjects, in some respects differing very widely from it. A greater importance attaches, both in itself and from the circumstances, to the little work published about the same time on the *Five Wounds of Holy Church*, the title and main purport of which at least will be familiar to our readers. Suffice it to say here, that Rosmini wished the bishops to be elected by the clergy and laity of the diocese, and to hold frequent synods, and take a more active and personal part in the training and supervision of their clergy; while he desired to see a much more efficient system of instruction of the laity in religious knowledge, and the substitution of the vernacular for Latin in the public services of the Church. This work was read in manuscript by Pius IX., and was in fact published, though Mr. Davidson does not tell us so, by his express order and at the pontifical press at Perugia. Rosmini at the same time came to Rome, nominally as Ambassador Extraordinary from the Piedmontese Government, who were anxious just then to secure the sanction and co-operation of the Pope in their conflict with Austria. This office, however, which was never much to his taste, as his views were not in thorough accord with those of the Ministry at Turin, he resigned after two months, but remained in Rome, where the Pope had received him most graciously and formally notified his intention of making him a Cardinal. But the brief drama of Papal liberalism, and with it Rosmini's day of grace at Rome, was rapidly hastening to a close. It had been determined to make him Secretary of State in Rossi's Ministry, when on November 15, 1848, Rossi was brutally assassinated, and shortly afterwards followed the Pope's flight to Gaëta, whither Rosmini, with more fidelity than discretion, followed him. It is idle now to inquire how far the catastrophe might have been averted if Pius IX. had been willing to be guided sooner and more thoroughly by the counsels of Rosmini, who had strongly condemned his refusal to allow the Papal troops to take part in the war against Austria. After the murder of Rossi and the flight to Gaëta the opportunity for conciliation was past, and the pontiff, frightened and perplexed, turned to very different advisers. Antonelli, who had always been jealous of Rosmini, naturally enough used all his influence now to get him out of the way, in which he was heartily seconded by the King of Naples, who had his own reasons for distrusting so ardent and single-minded a reformer. In January 1849 Rosmini quitted Gaëta for Naples, and on his return four months afterwards met with so cold a reception from the Pope that he made but a short stay, and in the following October retired to his old home at Stresa, where the next and last six years of his life were spent in

peace, but thenceforth his political career was at an end. Nor was this all. We have seen that the Pope had publicly announced his intention of raising him to the purple at the next promotion, but this design was equally offensive to his political and theological enemies, the Austrian Government and the Jesuits, whose influence was now paramount at Rome. Pius accordingly allowed himself to be induced, by a wholly unprecedented and we may hope unwilling stretch of prerogative, to revoke the nomination, and not only so, but also to allow both Rosmini's constitutional work, composed under his own guidance at the express request of Cardinal Castracane, and the *Cinque Piaghe*, published by his own command after he had read and approved it, to be condemned by the Congregation of the Index. It is true that the Pope, to do him justice, refused to go further than this, and that when the Jesuits professed to have detected all sorts of damnable heresies in Rosmini's works, he first enjoined silence upon them till a full examination had taken place, and eventually issued a sentence of entire acquittal from the charge. This tardy suppression however of an indictment equally malignant and preposterous, aimed as well at this nascent Institute as at his voluminous works, only came about a year before his death, on July 1, 1855. It has not, of course, diminished, though it has partially disarmed, the hostility of his Jesuit assailants, but the Order has flourished in spite of them, and has spread both in Italy and in England, where it has planted several colleges and religious communities. The rule is more elastic than that of the older Religious Orders, allowing more of individual liberty to its members, and being designed rather to further the parochial and educational work of the Church than to enforce a rigid monasticism. It is perhaps on this account that, out of the founder's own country, it has found acceptance chiefly, if not exclusively, in England. Whether his philosophical system will find equal acceptance here, when presented in an English dress, remains to be seen, and is too wide a question to enter upon at the end of an article. But it is noteworthy that his Protestant, or apparently Agnostic, critic in the *Fortnightly Review* accords to it high praise as "in very many respects the most profound that has yet appeared and the best adapted for bringing intollient harmony into the present chaos of conflicting opinions." He considers it indeed "better fitted than any other weapon to be," as its author meant it to be, "the Excalibur of the Catholic Church," but to his own judgment it commends itself, not in consequence but in spite of its "theological drawbacks," as being "by far the noblest original monument of human thought reared by any one person in modern times, towering above even those of Kant, Hegel, and Comte."

#### INTERNATIONAL BODY-SNATCHING.

SOME American citizens seem to have a singular love of disintering dead bodies and removing them from the places where they were deposited by the friends and relations of the departed. It is not long since all that was mortal of the late Mr. Stewart, a successful tradesman, was secretly dug up and carried off, nor are we aware that the relics have even now been recovered and restored. Mr. Stewart was probably by descent a Scotchman, yet we deem it an improbable theory that Professor Blackie and other Caledonian patriots have combined to remove his ashes to the land of the mountain and the flood. Some of the inhabitants of Pennsylvania, however, are eager to carry the bones of William Penn from their English grave to the State which Penn founded, and to bury them in the midst of a city where it is supposed that their presence will raise the moral tone of the public. There is something of ancient Greek sentiment in this proposal. About the time of the Persian—or was it the Peloponnesian war?—an oracle commanded the Athenians to bring back the mighty bones of their great local hero, Theseus, and to bury them in Athenian soil. According to the tradition, Theseus died in exile in Syros, and his posthumous restoration to Attica was a kind of amends to his memory. In the same way the removal of the dust of Dante from

the tomb  
On Ravenna sands, in the shade  
Of Ravenna pines,

to Florence, would be a kind of dilatory amends made by that city to the memory of her most illustrious exile. The reinterment of Napoleon in Paris was the most famous modern example of an honourable disturbance of the repose of the dead. All these are examples of the restoration of an exile to the country which regrets him. We can understand the French sentiment about Napoleon:—

Though more than half the world was his,  
He died without a rood his own,  
And borrowed from his enemies  
Six foot of ground to lie upon.

So Thackeray rhymed. And it was natural that the French should wish to transport their hero from a remote and hostile island to the capital of the nation which, for a moment of historic time, he made the foremost in the world.

The Pennsylvanian desire to bring back the ashes of Penn to Pennsylvania does not seem to us to have quite the same sentimental excuse. Penn, after all, was an Englishman, and he died in his own country, among his own people, among friends of his own religion. Among them, too, he was buried. "He is surrounded by his two wives and five children, and many of his most intimate friends," say the trustees of "Jordan's Estate," the plot

of ground in which Penn is interred. A Buckinghamshire man and a Quaker, he is buried in a Quaker burial-ground, in a quiet field of his native land. Why should he not be allowed to remain there, especially as the members of the Society of Friends and the trustees of the cemetery are anxious that his grave and the grave of his wives should not be violated, even by the pious hands of Pennsylvanians? We confess that we think the circumstances which justify interference with the last resting-places of men are rare; and it is not without regret that we read of invasions even of ancient barrows, and of modern pickaxes at work above the sleeping head of the King of Men.

The Pennsylvanians, or some of them, including the Mayor and Council of Philadelphia, take a different view of the case. The Hon. George L. Harrison, who came to England as representative of Pennsylvania, has published a pamphlet, in which he argues his case and produces a number of documents. Mr. Harrison complains that "newspaper influence has been allowed on one side, to the partial exclusion of the other." The fact is that both he and his opponents, the Trustees of Jordan's Meeting House, have written letters on the topic of Penn's remains in the *Times*. The rather unhappy thought of removing Penn's body from England to America occurred, two or three years ago, to a Philadelphia citizen resident in England. "The same party," as Mr. Harrison says, badgered the United States Minister and the President of the Pennsylvania Historical Society, and at last moved the Legislature of the State. We very much wish this Philadelphia citizen had sought out some less invidious method of displaying his burning patriotism. He might have known that Englishmen personally interested in Penn would oppose the project of tampering with his grave, and he might have inferred that—whatever lustre might be reflected on himself—the goodwill of the two countries would not be increased by the incident. The Legislature of Pennsylvania, however, and the Mayor and Council of Philadelphia, were convinced that it was desirable to transplant their founder from the country in which he was born and died to that in which he became illustrious. The Honourable George L. Harrison, of Phila. Pa., was appointed as Commissioner, or Agent, and received credentials to Mr. Lowell from the U.S. Secretary of State. We should like, by the way, to know what Mr. Lowell thinks of the whole transaction; his opinion is not referred to by Mr. Harrison. The "credentials" were signed on June 11. The Luton and Leighton Society of Friends held their monthly meeting at Jordan's Meeting House on June 2. They disapproved of the American idea, of which they had heard, and gave notice of their opposition to the Governor of Pennsylvania. Mr. Littleboy, Chairman of the Committee of Friends, was informed, on June 27, that the Honourable George L. Harrison was coming to England as the Governor's representative to confer with all who were concerned in the question. Mr. Harrison arrived in London, and passed a fortnight in "ascertaining what was the true judgment of judicious Englishmen on the subject," and in other business. How he selected his judicious Englishmen we do not know. But we do know, on his own evidence, that he took the opinion of a solicitor "that the claim cannot be maintained"—the claim, namely, of the English Trustees to prevent Penn's grave from being disturbed. But we are going on too fast. A week before Mr. Harrison met the English Trustees, they printed a circular, stating that "the application had been received, had been carefully considered in a dispassionate and cosmopolitan spirit, and had been refused from a sense of duty." When Mr. Harrison did meet the Trustees, he "objected to this paper and stated that he should answer it." But, immediately after the meeting, the circular "was forthwith published in the London *Times*, in a manner which could not fail to mislead the public on both sides of the Atlantic." This is the great grievance of Mr. Harrison. His complaint, as far as we understand it, is that his "application" was refused before his application was received. Obviously the Trustees made up their minds from the moment of their meeting early in June that they would not accede to the desire of the Pennsylvanian patriots. Perhaps there was a certain *brusquerie* in this action of the members of the Society of Friends. But we confess that Mr. Harrison's letter to them (July 16) is rather irritating. He tells the Trustees that he knows why they object, and, "as far as sympathy with a sentiment can operate, I am altogether one with them." "Sympathy with a sentiment" is good; as if the whole scheme for transplanting Penn were not the child of sentiment—unless, indeed, it had a less reputable birth, and was begotten by conceit on desire of notoriety. But we need not take that view. The desire to get hold of Penn's body is, at best, purely sentimental. But Mr. Harrison readily sets aside the mere sentimentalism which prefers that Penn's body should lie where it was laid by his friends, among his dead kinsfolk. Quakers are a peaceful people; but Mr. Harrison's condescending reference to their "sentiment" would annoy the meekest of men. He went on, with amazing coolness, to say that he was compelled to "forego emotional influences in behalf of the public advantage." Why, the "public advantage" simply means, in this case, a great emotional function in Philadelphia, with Mr. Harrison in the thick of it! He went on to assure the Trustees that, in a solicitor's opinion, they had no claim "to have the legal custody of the remains of Penn." Then, who has their legal custody? May American sentimentalists come over here, and dig up any corpse on which they set their emotional affections? We cannot but think that the people of Pennsylvania have chosen a very indiscreet "Commissioner" in the Honourable George L. Harrison.

Their desire to possess the remains of their founder is intelligible, and, in its way, pious. We do not feel sure that most Englishmen would wish to balk them if the Trustees of Penn's burying-place made no objection, for Penn was a genuine *oligarch*. But it is a different thing when a gentleman from America appears, sniffs at your "sentiment" and "emotions," and assures you that you have no claim to the legal custody of the bodies of your dead. Mr. Harrison in the same letter lets out that Penn has a descendant in America, who "was most eager for the realization" of the scheme "until he failed to obtain the official right to effect it." When the descendant discovered that he was not to have the benefit of the advertisement and the advantage of the notoriety, he changed his mind. We do not like this scheme, nor the scheming which it seems to involve.

The meeting between Mr. Harrison and the Trustees was held on July 18, and the Trustees read their circular (which they had already printed) as a reply to Mr. Harrison's "application." He objected to all this as "premature." The Trustees sent a letter to the *Times*, saying that they had first heard Mr. Harrison, and then handed him their reply, which was printed, we repeat, before they saw him. The reply stated that the "application made on behalf of the Governor and Legislature of Pennsylvania" had been received, and they gave their reasons for refusing. They thought Penn would prefer the silent society of his friends and relatives to the *pompes funèbres* of Philadelphia. Pomp, circumstance, and the chance of military parade are things which Mr. Penn was known to dislike. Besides, it is more than doubtful whether his bones could be identified. "Praise God Tompkins" might occupy the mausoleum in Philadelphia, as a mistaken Molière was placed in the Pantheon during the French Revolution. Many other reasons were given in favour of letting Penn rest where he lies. Mr. Harrison now wrote "a card" to the *Times*, complaining of the conduct of the Trustees. The Chairman of the Trustees replied that, on June 27th, he received a letter from the private secretary of the Governor of Pennsylvania with an account of the Pennsylvanian project in detail. "The Trustees at once prepared their reply, which was handed to Mr. Harrison on the 18th inst." Mr. Harrison wrote once more to the *Times*; he pointed out that Penn's remains could be identified by their lead coffin, and that the Pennsylvanians were ready to let their proposal depend on its acceptance by Penn's descendants—an offer refused by the secretary of the Trustees. Mr. Harrison added, in effect, that Penn was a public man, and that the utilization of the bones of public men was for the public advantage. He said a State like Pennsylvania had a better claim than "any mere religious society." Why don't the Pennsylvanians send over to Rome for a consignment of martyrs? "A mere religious society" has no claims as against a State like Pennsylvania. Mr. Harrison went on to say that, "until they were wanted in America," no one cared very much about Penn's remains. The idea of Penn being "wanted" is comic, and it is also comic to find Mr. Harrison saying that the Society of Friends, in not giving Pennsylvania what she wants, "take issue against all the world." Mr. Harrison wrote other letters to various people. He said that the decision of the question does not rest with the Trustees of Jordan's burial plot. "The remains of William Penn are not, legally, in their custody, if the opinions of eminent counsel in England and America are reliable." We do not in England call a solicitor (whom Mr. Harrison consulted) "eminent counsel." If Mr. Harrison wants dead bodies, he should ask more prettily. If any one thinks that the friendly relations between England and America will be strengthened by Mr. Harrison's way of asking for dead bodies, he greatly errs. Probably a number of notable Englishmen are buried in America; many fell in our old wars. We do not want to dig them up; and we trust that the Philadelphians do not approve of the letters of their representative, Mr. Harrison. May it be long before any other State "feels like wanting" some dust from Westminster Abbey or some bones from a country churchyard. They are much more welcome to a cast of a statue of Mr. Gladstone.

#### MR. CAIRD ON THE LAND QUESTION.

THE remarkable address which Mr. Caird delivered on Tuesday to the Statistical Society is perhaps the most important result of the attempt at agitation in England and Scotland which has followed the Irish Land Act. Mr. Caird's light is perhaps not exactly dry light—it has yet to be discovered where that kind of light exists—but it is very nearly dry. If Mr. Caird still worships some of the old idols of land reformers, if he attaches disproportionate value to such things as the abolition of settlements and the like, which could in any case only influence agriculture, in the way he thinks, in a very small degree, and at the end of a long course of years, he is free from the vulgar delusions of the theoretical land-law tinkers. He does not think that there is in England a "law of primogeniture," enjoining on every landowner to leave his land undivided to his eldest son; and he does not believe that if this mythical law of primogeniture were repealed, British agriculture would at once spring up and flourish, regardless of bad seasons and foreign competition. While he is thus proof against at least some of the delusions of the merely political reformers who wish to use land reform as a convenient political instrument, he is no less free from the views with which the Farmers' Alliance have made their

bold stroke for a slice of their landlords' property. He goes, indeed, further than unprejudiced critics are likely to follow him in the train of Mr. Gladstone by advocating, not merely compensation for improvements (of which no one seriously contests the propriety if the improvements have been made with the consent of the landlord), but an indefinite compensation for the tenant's "interest in his tenure." But this may be considered to be a concession to the new views, just as Mr. Caird's fondly-cherished belief in the malignant influence of settlements is a concession to the old. Between these two, and constituting by far the larger part of the address, are to be found what may be called the results of Mr. Caird's experience and reason as distinguished from the contributions made by his political and economical prejudices. They are exceedingly valuable, and it is not surprising that those who wish to make political capital out of the land question have been very lukewarm in their acknowledgments of Mr. Caird's contribution to their side of the question. After months and years of ridiculing the Agricultural Holdings Act, it must be annoying to find that the chief expert on their own side discovers in the lines of that Act the basis of his proposed settlement of the question.

What is really of most importance in Mr. Caird's address is not his recommendations for the future, but his exposition of the present. It is a really curious study in political economics to compare the pictures which have been drawn of the British agriculturist struggling in the fetters of a tyrannous landlordism with Mr. Caird's quiet demonstration of his actual position. True, the address wound up with a statement that it was necessary to "unshackle agriculture," but the body of it was devoted to proving that agriculture is more unshackled in England than in any other country in the Old World. By elaborate calculations, which certainly cannot be said to err on the side of generosity to the landlord, Mr. Caird proves that the English farmer is actually in possession of a position more favourable than that offered by the Irish Land Act to the Irish tenant, and infinitely more favourable than that of the French yeoman or peasant proprietor. He is, as Mr. Caird puts it, entrusted by his landlord with five-sixths of the capital necessary for his business at three per cent.—we should have said that two and a half was nearer the mark, but there is no need to insist on this—and this loan makes it possible for him in ordinary seasons to make ten per cent. on the one-sixth which he contributes. There is certainly no other business in the world which is conducted under such favourable circumstances. But (and here the debatable matter comes in) there is no doubt that the one-sixth contributed by the farmer is in a state of exceptionally perilous stability or instability. Bad seasons, such as England has lately had, may affect the landlord's capital in a greater or less degree; but they cannot absolutely destroy it. They may destroy, and in too many cases have destroyed, the capital of the farmer utterly. The question, therefore, is whether, in consideration of the exceptionally favourable position which in ordinary times he enjoys, the tenant is to stand the chance of this possible ruin, or whether it is by some more or less cunning legislative device to be shifted in part, or in whole, to the shoulders of the landlord. Mr. Caird appears to think, notwithstanding his own demonstration of the insignificant return which the landlord receives—in consideration, it may be supposed, of this very superiority of security—that some such device is necessary. He strenuously resists the proposition of a Land Court and "fair rents," and he resists with equal strenuousness the suggestion of "marketable security" or free sale; but he adopts the vague suggestion of compensation for "the tenant's interest as the law may define it in his tenure," which is one of Mr. Gladstone's many ingenious phrases. The question may fairly be asked, How can the law define what does not exist? There is no English tenant who has any interest in his holding beyond the year if he has no lease, or beyond so many years as his lease may have to run, together, if the contract does not exclude it, with the value of his unexhausted improvements. The assumption of any such interest has not the faintest shadow of a reason in custom or in equity. In many cases the tenant has simply come in like an ordinary householder having no connexion with the district, no inherited "title" (to give that word the sense which abuse has changed into use in Ireland), no expectation or intention of staying on the land one day longer than it suits and profits him to do so. At each expiration of his yearly tenancy, if it be yearly of his lease, if he be a leaseholder, the relation between him and his landlord is as completely terminated as that between a shopkeeper and a customer when the latter has paid his money and received his goods. It is curious that even so clear-sighted a man as Mr. Caird should be mystified by the jargon of the present in this matter of security of tenure, just as he is mystified by the jargon of the past in the matter of settlements and entails. But the very fact of his having succumbed in these two points gives greater value to his general testimony. It shows that, if he is prejudiced, it is certainly not on the side of the landowners, and it thus gives all the more force to his picture of the landowner supplying at a percentage about that obtainable from Consols five-sixths of the capital necessary to carry on a business which with ordinary good luck should return the farmer a rate of interest equalled only by that of the most risky investments, and, what is more, taking the hazard of depreciation of his own property, without the power of preventing it or the least hope of compensation.

It is almost equally noteworthy that while Mr. Caird abstains from the extreme remedies which the quacks of politics have put forward for agricultural depression, he takes at the same time a much less gloomy view of this depression than that which it suits the same

quacks to take. He sees no reason why the old arrangement of landlord, farmer, and labourer which has worked so well should not go on, and none why the land should not continue to yield, with some slight readjustment, the necessary three profits. He is, if anything, almost too sanguine as to American competition. But he has done good service by pointing out that the American farmer is by no means the unshackled producer which some people here delight to paint him as being, and that, putting the differential expense of carriage at the very lowest, it amounts to an advantage on the side of the English farmer far exceeding the whole rent of the highest-priced corn lands. One of the most valuable parts of his speech, though perhaps the least fully worked out, is his practical admission that over-cultivation rather than under-cultivation has been the fault of the last few years. The agricultural nostrum-mongers are never tired of repeating that their nostrums will lead to increased cultivation, increased production, and so forth. Mr. Caird almost avows his satisfaction at the fact that the lean years of the past decade will result in hundreds of thousands of acres of poor land which have been "huzzed and mazed" with high farming being left to the beneficent operation of the earthworm and the sheep. The "natural fertility" which year after year of exhausting culture has taken out of the land may perhaps return when season after season of enforced fallow has interrupted the process. Neither does Mr. Caird give any countenance to the theory which some persons have constructed out of isolated cases like that of Mr. Prout's farm at Sawbridgworth, that mixed farming has had its day. On the contrary, he thinks that mixed farming will continue to hold its ground. Indeed he is, as he has always been, an advocate for an extension of the principle of mixing; and points once more to the enormous importation of foreign butter, which now represents an annual value of twelve millions.

The tone of the whole address may thus be said to be in the main conservative—using that word in no political sense. That Mr. Caird is following a will-o'-the-wisp in his notion of the enabling effect of the abolition of settlement is pretty certain. Indeed, one not impossible result of such an abolition would seem to be, not the benefit of tenant-farmers, but the doing away of tenant-farmers altogether. For the landlord, restrained by no sentimental feelings from dealing with his land as a purely commercial article, and able to raise on his own security the sum necessary for its cultivation, but now best obtainable on the farmer system, would very likely decide that the ten per cent., as well as the three, might as well go into his own pocket. In these days of "Will Wimbles" and agricultural colleges, competent managers, at far less expense than that represented by the farmer's profit, would very soon be obtainable, and many farmers themselves would probably prefer a fixed salary and no risk to a sliding scale of gain or loss. It would be somewhat comic if this much-vaunted farmers' measure were to turn out in such a way; but the thing is by no means impossible. Again, though Mr. Caird's proposed two years' notice to quit and his objections to disfranchise are matters for fair discussion, his indefinite "interest in tenure" is certainly a mistake. These, however, as has been sufficiently shown, are merely fringes of his argument. That argument is that the three profits are still obtainable on the old basis of free contract, shackled only with some comparatively insignificant restrictions which are mere sacrifices to current cant. He may have been somewhat too sanguine, though it is worth noticing that he has based his calculation of the "natural protection" of the British farmer by his nearness to the market on an estimate of the cost of transit from America even lower than that adopted by Mr. William Fowler in his melancholy letter to the *Times*, published a day later than Mr. Caird's address. Mr. Fowler's, however, is evidently what may be called political melancholy, a distinct and very interesting species of the genus. Mr. Caird is something of a politician, too, but he has the singular merit of letting his politics colour his opinions only and not his facts. It is very much to be wished that more of those who talk and write on what he himself well calls "by far the greatest interest in the country in importance, influence, and strength" would follow his example.

#### ŒDIPUS ROI AT THE THÉÂTRE FRANÇAIS.

THE unceasing vitality and interest belonging to the great tragedies which have survived from the Athenian stage has within the last year or two received most important illustrations. An interesting, if not altogether a successful, attempt to give a representation of the *Agamemnon* of Æschylus, originated last year at Oxford, and the performance was repeated at some of the public schools, as well as in London. A spirit of emulation afterwards roused the students at Cambridge, Massachusetts, to follow with a rival enactment of the *Œdipus Tyrannus*, and they carried the matter so far as to have their play-bills in Greek, which, in addition to giving the *dramatis personæ*, as usual, announced the conveniences provided for the homeward return of the spectators, and gave the information that Μετὰ τὴν βίαν ἀμειβὰ ἱπποσίδηδρομικαὶ εἰσὶμαί ἑσονται τοῖς εἰς ἄστυ πορεύεσθαι μέλλουσιν, with a translation to the effect that horse-cars will be ready after the performance for those who wish to go to Boston. The elaborate and successful dressing of the piece is fully described in Scribner's *Century* magazine for the month of November. But these Greek plays in the original Greek failed to do justice to the dramas they professed to reproduce, in two ways. University students, without the training of actors, could not be expected to possess the power of ex-

citing the emotions of their audiences, even of that portion of them who understood the language of the play; nor did the *mise en scène* profess to give a correct notion of how the play would have been seen in a Greek theatre. Masks and buskins could not be expected; nor did the Chorus occupy its proper place; but, on the contrary, it mingled with the other characters on the same platform, and lost its true character of being a band of moralizers and lookers-on. Old playgoers may recollect a performance of the *Antigone*, given in English very many years ago at one of the large London theatres, in which the music of Mendelssohn formed a beautiful background and support, so to speak, to the spoken words. The part of the Chorus was well spoken by Mr. Vandenhoff, who duly kept apart from the other performers. The genius of Sophocles and the charming music procured for this effort a certain amount of success. Eminent men of letters might have been seen following the words of the play with the Greek text in their hands; while the excellence of the plot and the pathos of the situations moved also those who were only able to appreciate them through the medium of the English words. But, as might have been expected, the piece had no run.

Twenty-three years ago, in the year 1858, a fairly literal translation, by Jules Lacroix, of the *Œdipus Rex* of Sophocles was brought out at the Théâtre Français in Paris, in which the principal character was sustained by Geoffroy, and in which Mmes. Favart and Stella Colas recited some of the verses which were taken from the chorus of the original play. In the autumn of the present year this great work has once more been placed on the stage, a tragedian having again been found endowed with all the art and all the qualities necessary to support a task of extraordinary and arduous difficulty. The power and imaginative force of M. Mounet-Sully have proved equal to the exigencies of the occasion. The tendency towards the exhibition of moments of unruliness, and of a sort of wild explosion of fire, is in this play chastened and controlled by the severe spirit of the Greek drama, as indeed it was in his Hippolyte, his Oreste, and in his admirable performance of the chief personage in *Les Horaces*.

In the first scene, the entrance of Œdipus appearing on the threshold of his palace to address his people splendidly prepares the way for all that has to follow. M. Mounet-Sully's bearing is that which befits a ruler of men. He is mighty and he is tender, showing a manly and generous sense of duty to those whom the gods have placed under his charge. Then arrives the response from the oracle, and the dread command of the God is announced:—

Purgez le sol thébain du monstre qu'il nourrit !  
L'incurable fléau demande qu'on l'expie.  
Il faut chasser l'impie,  
Et que le meurtre soit par le meurtre lavé ;  
C'est du sang qui déborde, et rougit le pavé.

The story of the murder of Laius, with his escort, in a narrow defile, imperfectly known to Œdipus, is briefly reported, and the King retires to his palace, promising to do all he can to avenge the murder of his predecessor on the throne.

At the beginning of the second act the stage is filled with supplicants for the help of the King to fulfil the behests of Apollo. As the entreaties of his people sound in his ears, the whole heart of the actor seems to respond to their woes; and he expresses his desire to do justice and to punish those who have brought curses upon the country, with a frankness and energy which brings the audience into immediate sympathy with the loyal nature of the man. He appeals to the citizens of Thebes with force and dignity to reveal anything which would lead to the discovery of the murderer of Laius; and he sustains the long and trying recitation which follows by a variety of intonation, and indicates quickly-changing emotions in a manner which relieves it from the monotony into which a less poetical actor might be likely to fall. He will revenge Laius, and determines to discover his assassin. The prophet Tiresias is summoned, and is adjured by the King to give his assistance. He knows the truth, and reluctantly denounces Œdipus himself as the murderer:—

Tu cherches l'assassin de Laius. C'est toi-même.

The accusation is met with withering indignation and an acute sense of wrong done and imposture attempted. But Tiresias repeats his assertion, with a frightful prophecy of the impending fate of Œdipus, and an allusion to the unconscious crimes he had committed in murdering his own father and marrying his mother.

An interview with Creon begins the third act, in which, with superb defiance, Œdipus upbraids him as a traitor, and Jocasta now appears upon the scene. In the dialogue with her which ensues the terrible truth begins to dawn upon the King. He learns more of the circumstances attending the murder of Laius, and the recollection comes upon him of his own similar encounter with a white-haired stranger, whom he had slain. Every trait of the tragedian's countenance is now a witness to the inward dread, always increasing upon him, as he relates his own adventure, and questions her for more minute details of the death of Laius. His voice sometimes sinks to a trembling gasp of apprehension, as the identity of the two events becomes more and more evident. He seems now to be battling with fate; he recollects that he had once been told that he was not really the child of Polybius of Corinth, his supposed father, and that at Delphi he had received a response to his inquiries, presaging for him a terrible future. The lines—

Le Destin est cruel !  
O sainte majesté des Dieux, ce jour funeste,  
Qu'il ne luise jamais pour éclairer l'inceste !  
Avant qu'un parriede ensanglante mes mains,  
Grands Dieux, retranchez-moi du nombre des humains !

are spoken in tones so imploring, that any divinities less cruel than the gods of Greece must have been struck with pity by their sound.

The fourth act opens with the arrival of the messenger from Corinth to announce the death of Polybius, and Œdipus bursts into triumph as he thinks it is made clear to him that he cannot now commit the crime of parricide, to which he believed himself fated. This triumph the actor knows well how to mingle with a tender reverence for his departed father. All these prospects of happiness are destroyed by the arrival of the messenger who discloses the truth that Œdipus was a foundling, adopted by Polybius, and that a certain old shepherd alone knows the real secret of his birth. Jocasta now begins to manifest the utmost alarm, and entreats her husband not to seek to penetrate the mystery; Œdipus rejects this counsel, and attributes her fears to a suspicion that he may be discovered to be lowly born. He sits at the foot of the altar in front of the royal palace, and it is wonderful to follow the varying moods of expression on his countenance while the Theban maidens are singing their consoling strains. His face, the reflex of the hurrying emotions of his mind, fixes the attention; it is like watching a stormy sky where the clouds roll up together for a while in heavy masses, then break apart to open a way for the sun's light.

The entrance of the slave of Laius, who had alone escaped from the slaughter of his master and his comrades, leads to the revelation of the whole truth. He is the same person who had been employed to expose the infant Œdipus, in order to prevent the fulfilment of the prophecy that he would some day become the murderer of his father, but who had not completed his cruel task. In despair, and with the fearful resolve to be carried into execution in the interval between the fourth and the last act, the innocent-guilty man exclaims:—

Hélas ! tout s'accomplit, toute ma destinée !  
Exécration naissances ! exécration hyménées !  
Inceste et parricide ! . . . Adieu donc ! je te vois,  
O lumière des cieux, pour la dernière fois !

M. Mounet-Sully's passion was such in the delivery of these lines as to be equal to that of the poet who wrote them, and for the moment to place the actor on a level with the creative power of which he was the interpreter upon the stage.

The last act opens with the narrative of what has taken place within the palace—the suicide of Jocasta, and the consequent horror of Œdipus, who, in the overwhelming passion of the moment, has torn out his eyes with the brooch which fastened her mantle. Œdipus enters, and in the aspect of the man his whole history is told. It is not the adjunct of the bleeding eyes which now most deeply stir the spectators. It is the intensity of woe which is revealed in every movement of the altered features and of the tottering figure, whose bearing had been so majestic, and the tone of the voice, hoarse, yet articulate. The inward struggle is recognized in its necessary outward signs. The strain on the audience might now become too great but for the relief of tenderness which almost immediately succeeds in the parting of Œdipus from his children. Often as pathetic farewells of a similar kind have been presented on the stage, seldom has any made an appeal so forcible. Tender also and true is the delivery of the words

Apollon, mes amis, Apollon ! . . . son courroux,  
Sa haine injuste et sombre  
M'a fait ces maux, ces maux cruels, ces maux sans nom,  
Sa main n'a pas frappé ; seul, j'ai porté les coups.

When the blind, disrowned, and ruined King is led off into exile, by a single attendant, from his children and his home, the tragedy concludes with its most tragic scene. Throughout the piece, great as is the pressure put upon the actor, he sustains his part without ever losing his command of the rich flexible voice with which nature has endowed him, the resources of which seem to be more and more developed by the increased demands made upon it.

Passing from the principal figure to the other characters and general stage arrangements, it must be said that the part of Jocasta is filled by Mlle. Leroux, a young pupil of the Conservatoire, with considerable dignity and intelligence. The diction of M. Silvain as the priest of Jupiter merits especial praise, and M. Maubant was imposing as Tiresias. The accompanying music, by Membres, composed for the occasion, adds an important element to the success of the tragedy.

The grouping, whether in action or in repose, of the crowd upon the stage is always to be admired. The excellence of the management of the Duke of Saxe-Meiningen's Company in this respect demanded and obtained great commendation during their performances in London this year. Every person knew his place, and had been carefully and intelligently trained to contribute his appropriate share in producing the desired general effect. Any criticism not wholly favourable would have been to the effect that the attention of the spectators was sometimes too forcibly attracted to the byplay and diverted from the actor in possession of the stage. In *Œdipe Roi* at the Français the beauty and propriety of the grouping is quite equal to that of the Saxe-Meiningen troupe; but there is greater abstinence shown in not overstepping the due limits of severe art. Yet when elaborate action is required it is forthcoming. This is the case throughout the representation, and notably so in the last act; and while the blinded King is feeling his way out from the palace, which he is never to enter again, among the columns and down

the steps of the portico, nothing could be more finely indicated than the emotions of expectation, curiosity, interest, wonder, and horror with which his movements were anticipated and followed.

#### SIR ORIEL FORSTER'S HALF-CROWN.

IT appears that those persons who commented last week on the proceedings of the Sub-Commissioners under the Land Act in Ireland committed a gross injustice. They assumed, and in some cases asserted, that the Sub-Commissioners were recklessly cutting away at rents and reducing them wholesale. This, it is now known, was not the fact. In one remarkable instance an investigation under the Land Act has resulted in an actual increase of rent. This is all the more remarkable, because one Sub-Commissioner last week expressed a doubt whether, under an application for a fair rent, the Commissioners had power to increase at all. A fair rent, according to his view, is necessarily a reduced rent. However, no such general principle finally guided Mr. Commissioner Kane and his fellows at Monaghan last Saturday. Mr. Kane has been already noted as possessing "glimmerings"—as having a kind of far-off idea that the "live and thrive" axiom is absurd in principle and impossible in practice when you have occupants at about the rate of one human being per acre of bog. His glimmerings, as we shall see, are intermittent, but they do occur. At any rate, he is entitled to the proud position of being Chairman of the only Sub-Commission which up to this time, or at any rate up to the middle of this week, had raised a rent. The mere fact of the raising is not quite so remarkable as the amount and the circumstances of it. The Sub-Commission had been occupied for some time on the estate of Sir Oriel Forster, who seems for his sins, or more probably for his good-nature, to be plagued with a whole legion of small tenants—tenants of the class of holdings on which even Mr. Kane has frankly declared that no man can expect to support himself. The Sub-Commissioners looked at the plots (it would be absurd to call them farms), and seem to have been made unhappy by the inspection. At any rate, when the moment of decision came, Mr. Kane made a long and a highly apologetic speech. We really cannot take the trouble to abstract this; it will be sufficient to say that Mr. Kane began by saying that the rents could not be considered excessive or exorbitant, and that there was nothing like oppression on the part of the landlord, and ended by reducing the said rents, which were not excessive, oppressive, or exorbitant, by amounts varying from ten to twenty per cent. Strange to say, Lord Monck has not written a letter about these cases; and even Mr. D. H. Macfarlane, who is tired of hearing about MacAvey's case, has nothing to say about it. But Mr. Kane and his Sub-Commission were not partial. If they reduced, they also increased. The rent of one holding had been 3*l.* 15*s.*, being considerably below "Griffith." The Commissioners have increased it to 3*l.* 17*s.* 6*d.* In consideration of this, doubtless, they suggested that Sir Oriel Forster and a few other landlords who had just had, with the famous exception, their admittedly fair and ordinary rents reduced all round, should come to an arrangement with the people about arrears. "This," said Mr. Kane, "would be a charity"; and he doubtless felt that charity could not but become a man whose rental had just been increased by thirty pence, whether or not it happened to be diminished at the same time by thirty pounds or more. Elaborate and rather unfeeling jokes have been made about Sir Oriel's half-crown. It has been calculated that, if he husbands it carefully and lays it up as it comes in at compound interest for forty years, it will about repay him for the costs which his amiable tenant has imposed on him; for it seems that, even when a tenant's rent is allowed to be fair, the landlord has to pay his own costs. Meanwhile there is the solid deduction from the other rents allowed to be neither excessive, oppressive, nor exorbitant, which Sir Oriel must also capitalize and set against this half-crown. Never, probably, had that piece of money a harder task set for it, but after all it is in its way a lucky coin. On it alone depends the truth of Mr. Gladstone's asseverations, of Mr. Forster's and Lord Selborne's pledges, that no damage should be inflicted on the Irish landlords. The Lord Chancellor, indeed, is proved a prophet. In a dauntless manner he assured the Peers that the landlords would find their property positively improved and increased by the Act. *Ecce signum*, in the shape of Sir Oriel Forster's half-crown.

The idea has crossed the minds of one or two contemplative students of Irish affairs that the actual Commissioners are not quite happy at the vigorous action of their subordinates. There has of late been noticeable a considerable alteration in the amiable zeal with which Mr. Justice O'Hagan and his colleagues originally sought to invite all tenants to come to them, and to be made to live and thrive. Plaintive confessions have been made that their decisions are much commented on, and that it will not do to strain matters too far. On Monday last, a solicitor who wanted to lodge a sack full of applications after the proper time was refused. But the most significant incident was that which occurred in the matter of the Ballina Sub-Commissioners. The chief of these gentlemen, Mr. McCarthy, had come in like a lion indeed. He had laid down a large number of rules excellently calculated for the better reduction of rents, but not so excellent viewed from the other side—a side which the Land Act says shall also be taken, but which the Sub-Commissioners apparently decline to consider. The most remarkable of Mr.

McCarthy's alleged statements was, that "he did not care a straw for the evidence of paid valuers." He and his colleagues, he said in effect, and almost in so many words, were very clever men who knew all about land. Then there are the active and intelligent farmers of the district, whose impartiality of course cannot for a moment be doubted. This being the case, what need can there be for the testimony of professional hirelings obstinately regardless of the Irish tenant's palladium, Professor Baldwin's dictum about the capacity of land in the hands of the actual tenant? Unfortunately, a certain Mr. Mullens, residing in Westmeath, took the liberty of calling the attention of the Commissioners to the alleged words of their impetuous delegate. The reply of Messrs. O'Hagan, Litton, and Vernon speaks well for their ingenuity. They say very properly that they have no authentic report of the words used—"But there can be no doubt that cases will constantly occur in which the evidence of paid witnesses will be of great importance." Now, if Mr. McCarthy used the words attributed to him, this is rather a serious slap in the face; and, if he did not, it is still an important admission of a principle which certainly does not seem to have guided any of the Commissioners hitherto—always with the exception of the celebrated case of Sir Oriel Forster's half-crown. What these gentlemen seem generally to have done is to hear all the evidence they could get from the tenants and their neighbours, every one of whom is, of course, interested in depreciating the holding as much as possible; then to administer interrogatories to the agent as to whether he had considered the number of mouths in the tenant's family; then to view the land with their own eagle eyes; and then to cut off a fancy bonus for the tenant. It is quite natural that persons adopting such a course of proceeding should not care a straw for the evidence of paid valuers; indeed it is quite conceivable that they might find the evidence of paid valuers a great nuisance. But it is not equally clear that their plan is a wise one. It seems to be forgotten that at the rate at which they are going, one of two things is inevitable—either a wholesale reversal of their decisions, which would cause far greater discontent in Ireland than that which at present exists, or else a demand, which even Mr. Gladstone would find it almost impossible to resist, for great sums of money as compensation. It is not everybody, it must be remembered, who has, like Sir Oriel Forster, a sufficient solatium already provided for him.

An exceedingly interesting and pleasing statement, well imagined, if not true, has been made to the effect that M. Gustave Doré is now in Ireland for the purpose of studying Irish facial expression. It is a pity doubtless that M. Doré is not the M. Doré who drew the *Juf Errant* plates and the illustrations to the *Contes Drolatiques*. But there is a good deal of him left, and Ireland will give him an abundant harvest. The scenes, for instance, which occurred at Castle Island and Killavullen on Saturday would have supplied him with a most admirable opportunity for studying Irish facial expression. The facial expression of an Irishman who has paid his rent, and is accordingly first shot and then thrashed with the butt-end of a gun, is one which M. Doré could give with great success, and the facial expressions of the gallant ministers of vengeance would also suit him excellently. The other scene, where twenty men with rifles and revolvers literally stormed a house, dragged the inmates out of bed, stunned the master of the house, and so forth, would form a capital subject for a picture twenty feet long or so; and if there is any room vacant about the Houses of Parliament the work of art should certainly find a place there as a memorial of Mr. Gladstone's Administration and the effect of his Messages of Peace. Acute students of physiognomy, however, know that a court of law offers opportunities second to none for their favourite pursuit; and though the "Court of the Land League" can hardly be called a court of law, it is perhaps all the more likely to be fertile in such studies. The paid valuator informed by Mr. McCarthy that he doesn't care a straw for his evidence would be commonplace, but not ineffective. The villainous countenance of an agent admitting that, in calculating the rent of Denis Rafferty's farm, he has forgotten to estimate the capacity of the mouths of that gentleman's tenth daughter, and her husband, and her two children whom Denis has affectionately taken to live and thrive with him and the rest of the family on a holding of three acres and a quarter, would be a fine picture; nor would the manly and intellectual visage of the Commissioner putting the question, and blushing for his kind as he receives the answer, be a bad pendant to it. The ingenuous witness who has a couple of hundred pounds in the bank swearing that it is impossible for him to pay his rent and live, should figure in the gallery, together with the generous unpaid valuator and neighbour, who, remembering that one good turn deserves another, and having lodged an application of the same kind himself, assures his Honour that the dirty farm isn't worth five shillings an acre. There are precedents for this type of countenance. Thackeray has already depicted it in "The Irish Sketch Book," chapter *From Waterfall to Cork*. "A message of peace and plenty" might be the epigraph to a portrait of a solicitor seated in his private room; with one hand he points to the Land Act, with the other to a vast pile of applications, while his placid gaze rests on an open bank-book with an entry of two thousand pounds (see *Daily News* of last week) on the left-hand side. It would take too long to go through this new Doré Gallery, of which the last described picture should perhaps hold the central place. But there can be no doubt what ought to be opposite to it; a full-length portrait of Sir Oriel Forster in regimentals (for it is understood that he serves the grateful country which, as a return for his being neither an

oppressive nor a rack-renting landlord, cuts down his rents some fifteen per cent.) contemplating his half-crown with an expression of the liveliest gratitude, and carelessly trampling under foot, as a forgotten thing, a rent-roll with the reductions marked on it, is a *sine quâ non*. As soon as M. Doré has mastered the rudiments of Irish facial expression, he had better set about this at once.

#### THE FUTURE OF FIELD ARTILLERY.

IT may be as well to preface the remarks we propose making upon this subject by at once allowing that it is in many quarters considered to be a knotty one; and it is also one which is apt to elicit strong expressions of opinion. We shall limit ourselves therefore to answering a question recently urged as to the necessity of providing an army with field artillery at all, and to inquiring in our turn how it is that the question may not unfairly be said to demand a serious reply.

In the Franco-German war the casualties by rifle fire amounted to about 94 per cent. of the total loss; by artillery fire to only 5 per cent. No trustworthy estimate, so far as we are aware, has been formed regarding the comparative damage effected by the various arms in the Russo-Turkish war; but it is certain that the percentage of loss from gun-fire was very small, owing to the indifferent handling of artillery on either side. Guns then, even when well served, as were the German ones, do not effect that wholesale slaughter which would seem at first sight to be their *raison d'être*. And there is no doubt that all armies—especially those with small manœuvring capacity—feel artillery to be a terrible encumbrance unless when deriving actual benefit from its support on the battle ground. Even an able and enterprising general, at the head of an easily handled force, must ponder much how he had best dispose that interminable train of guns and waggons which blocks up the roads, which is powerless while in movement and against flank attack, and which demands the constant escort of another arm. But when armies are composed of raw material like that which went to swell the French armies on the Loire in 1870, then indeed the presence of a number of guns is embarrassing to a commander in the highest degree. Under such circumstances it has often happened that a general has had to think more of how he is to preserve his guns from capture than how to utilize them in action. Again, artillery is an arm costly to maintain and troublesome to keep efficient. Moreover, in the last war it proved wholly inadequate to the battering down of well-prepared earthworks or to reaching their defenders. Further, the principal projectile of artillery—namely, shrapnel shell—is most effective against troops in formation or grouped in the open; but now, through the utilization by scattered infantry units of cover at every step, the missile is continually being defrauded of an appropriate target. Again, the efficacy of gun-fire is immensely increased at the closer ranges, but the growing power of the rifle tends to keep guns more and more at a distance. Lastly, it is acknowledged that, unless exceptionally, the parapets of field works are better occupied by rifles than by guns.

We may briefly summarize what there is to be said on the other side of the question. First, then, the moral effect of guns is something enormous. If they only kill 5, they frighten 95, in every hundred. The roar proceeding from a line of guns, and the hurdling of the missiles sounding perilously near even when a long way off, impose upon troops, and especially upon young soldiers, who know also that when a shell does hit it will not be a reminder more or less sharp from an artistically shaped bullet, but a blow that may smash the combatant in an instant out of all semblance of humanity. This knowledge is apt to make men less eager to quit some happy cover; but more than this, it tells on their own shooting, nervousness inducing rapid and unsteady firing. Another point is that there are certain kinds of fortification—such as loop-holed walls and masonry buildings—which would frequently be impregnable to infantry attack until the guns had made practicable breaches or had shelled the defenders out of them. Again, it is undeniable that few positions can be assailed in front with the least prospect of success until artillery fire has paved the way for the infantry assault, and, indeed, unless guns can be got to conform till almost the last moment to the infantry advance. It follows that the attacking side must be provided with artillery, and therefore the defence must have guns also. It may be broadly stated that, wherever ground favours the action of artillery on a large scale, whether in attack or defence, no increase in the numbers of infantry or cavalry, or of both arms in combination, will suffice to make up for the absence of guns.

Since we cannot dispense with field-pieces, it will be more practical to inquire how it is that their action is certainly less efficacious now than it was, say, on the battle-fields of Napoleon and Wellington. First, as we have seen, long-ranging rifles either keep guns at a distance or cause enormous losses if they are brought near; 2ndly, close formations within reach of the enemy, offering fine targets, are virtually abolished; 3rdly, entrenchments are now more frequently constructed, and cover is sought after at every step; 4thly, our guns are sighted on a bad system; 5thly, the gunner's unaided vision fails to reach even the ordinary limits of the projectile; and 6thly, ground is not always or generally met with where guns in any number can be worked at the ranges now attained.

The question follows, Is there a remedy for this state of things? Taking the several points *seriatim*—we have to remark first that

rifles must continue to keep guns a long way off, unless the gunners can be artificially protected. But there seems to be no reason whatever, beyond a conservative objection to untried novelties, why some system of giving protection should not be experimented upon. It is now some time since Colonel C. B. Brackenbury, R.A., advocated the adoption of shields. Major Walford, R.A., proposed the substitution of steel plating for spokes in gun-wheels. Captain Scott, R.E., suggested a shield in the shape of a Japanese umbrella, the gun to act as handle. Other capable men have made suggestions with the same view, but we believe not a single proposition has yet found even the favour of a trial.

The dispersion of troops both in attack and defence deprives projectiles of the opportunity of making wholesale slaughter; but there are always occasions—notably in the last acts of an assault, in retiring from unsuccessful attack, or in abandoning a position defended to the last moment—when there must perforce be magnificent marks afforded to the guns, if only they are near enough at hand.

How huge earthworks, when constructed after the fashion set at Plevna, are to be dealt with is certainly a question on which it would be rash to dogmatize. One thing is quite clear—that, if time is given to throw up works whose defenders are practically secure from both horizontal and vertical fire, field guns will effect nothing. One wounded Turk was the sole result of several hours of heavy fighting on the part of the Russians before Plevna. It must, however, be remembered that what are called entrenchments now would formerly have been considered as veritable fortresses worthy the attention of a siege park, and only to be approached by sap and mine. General Brialmont has indeed given it as his opinion that armies in the future must be accompanied by parks with short siege guns. Where such works as those at Plevna are established, and it is necessary to attack them, something more than even improved field guns will be required; but in a campaign between two equally matched and enterprising opponents, it is far more probable that use will be made of hasty entrenchments and any chance cover than that we shall see armies *adossées* to gigantic works requiring large garrisons, which might be better employed so long as any power of taking the offensive existed.

We come now to the two points concerning which there can be no dispute—namely, the possibility of improving the sighting of field pieces, and assisting the gunner to see his mark as well at the longer as the shorter ranges. To Captain Scott, R.E., belongs the credit of proposing an entirely original system of sighting—one which is at the same time extremely effective, and easy of practical application by even inexperienced hands. "The principle of my system of sighting," to borrow the inventor's explanation, "consists in giving to sights a third movement in addition to the two movements already existing. The two movements of the present sights consist in a horizontal movement for giving 'deflection,' and in a vertical movement for giving the 'angle of elevation.' The additional third movement in my system consists in causing the two above-mentioned movements of the service sights combined to revolve together about an axis *parallel in every direction to the axis of the gun.*" The advantages of the system are obvious, and we may add that they are fully realized in French experimental practice. Once the gunner has command over the axis of his piece, his business is easy. But this is just what he is unable to get with the service system. He is thrown out by every inclination of the sights—and guns are very rarely for long on level ground—and, to make up for inclinations, he has to work out in his head a sum in arithmetic, perhaps under a heavy fire. In addition to this, the amount of annual practice performed by each gunner is absurdly small. "How," asks Captain Scott, "can a gunner possibly appreciate all the errors inherent in his system of sighting, or practically learn to apply the rules for their correction, by merely firing away three or four shots per annum? You might as well expect a man to become a good sportsman by letting off a fowling-piece three or four times yearly." By Captain Scott's method mechanical adjustment takes the place of mentally calculated arithmetic.

But improved sighting is not sufficient; the object to be hit must be seen, and it is proposed to furnish the gunner with "telescopic revolving sights" for the longer ranges. Without entering into particulars, it will suffice to record some opinions of a French Committee of scientific officers who experimented upon this sight. "By its use," they say, "the firer can aim accurately at distances equal to the range of the piece"; "he can aim at objects invisible to the naked eye"; "he has not to trouble himself with the inclination of the wheels, and therefore always fires as if the wheels were on level ground"; "a shot having been fired, he can judge of its effect," even at the longest distances; "the Committee consider it their duty to lay stress on the splendid results which have been obtained, and to call special attention to the fact that Scott's telescopic sight solves completely and practically the problem of a telescopic sight; and that its adoption by an artillery will give to that arm a very considerable advantage if it has to engage an artillery unprovided with an analogous system."

On the last of the points we have mentioned—namely, that ground is not very frequently met with where, with suitable command, the extreme power of range can be utilized—there is very little to be said. When a general disposes of a numerous artillery, he will of course endeavour to secure a fair field for its action. But, though the value of long-range fire will be vastly enhanced when guns have received improved appliances, battles will not be decided at long bowls. The final advantage must still lie with

that artillery which is provided with portable artificial protection and which is therefore enabled to draw in closer.

On our view of the matter, then, there is no ground whatever for supposing that the importance of artillery as an arm will suffer diminution. If within the range where battles are decided the power of the rifle is infinitely greater than was that of the old musket, it is within that range that the power of the new field-piece—the Hotchkiss revolving cannon—is most conspicuously felt; and outside that range the field-piece proper has it all its own way as before, or should have it so. Let those improved appliances be given it for which artillerymen have long been looking, and let the limits of its potential capacity be better recognized than was the case in the last war. There we saw out-of-date ordnance worked on out-of-date principles and set to impossible tasks. There is not much argument one way or the other to be founded on that experience.

#### AN INFERNAL DICTIONARY.

WE live in an age of dictionaries and books of reference on every conceivable and inconceivable subject; but perhaps none of the volumes which are nowadays from time to time compiled, with more or less industry and skill, for the purpose of giving compressed information, are more remarkable than a work which was first issued in 1818, and of which a sixth edition was printed in 1863 by M. Plon of Paris. This work is entitled *Dictionnaire Infernal, Répertoire Universel des êtres, des personnages, des livres, des faits et des choses qui appartiennent aux esprits, aux démons, aux sorciers*, and so on. The sixth edition is largely increased, and has over five hundred illustrations, "parmi lesquelles les portraits de 72 démons." The preface to the edition of 1863 is not the least curious part of the volume. It begins with a statement that "the enormous collection of coherent facts to be found in the Infernal Dictionary forms such a pandemonium of plausible aberrations and germs of error that the Church only, whose torch never burns low, can be a sure guide through its mazes." It goes on for two pages in this strain, mentioning by the way the remarkable fact that "every one who studies history in a proper frame of mind will see that 'l'Eglise' has always striven against superstition, and 'les fourberies infernales,' " a fact which the writer proceeds to back up with sufficiently curious evidence. However, the portraits of the seventy-two demons, and the other matters contained in the body of the volume, are, perhaps, more generally interesting than the preface, although the preface has a certain interest of its own.

On the first page of the Dictionary itself we find a pleasing absence of that pretence to universal knowledge which is the bane of compilers; for we are told that "Abalam, prince de l'enfer," is "très-peu connu"; but this is well contrasted a few pages later with the special knowledge displayed under the heading "Agnan ou Agnian" ("car," the writer might have added, "l'un et l'autre se dit"), who is described as a demon who torments Americans by visions and evil pranks. He is to be found particularly "au Brésil et chez les Topinamboux." He has further the unpleasant talent, which is calculated to baffle inquiry, of showing himself in every kind of shape, so that "ceux qui veulent le voir peuvent le rencontrer partout." How he is to be recognized under these Protean masks we are not told; nor is any reason assigned for his devoting himself especially to the torment of Americans. The cut which accompanies the description is presumably one of the promised seventy-two portraits of demons, and suggests that Agnan's knowledge of the art of disguise or "make-up" is, after all, of a limited nature. Aguarès, on the other hand, "grand-duc de la partie orientale des enfers," will have none of these tricks. He disdains disguise, and shows himself always in the form of a nobleman astride a crocodile. He confers titles, teaches all languages, and is wire-puller to the spirits of the earth. In the article following that on this accomplished demon, which treats of Pierre d'Aguerre—who was accused by two witnesses of having acted as Master of the Ceremonies at the Witches' Sabbath, and was, in consequence, condemned to death—we are referred to the articles headed respectively "Bouc" and "Sabbat." From the first of these we learn that "si on se frotte le visage de sang de bouc qu'il aura bouilli avec du verre et du vinaigre, on aura incontinent des visions horribles et épouvantables." Not only this, but one can also "procurer la même surprise à des étrangers qu'on voudra troubler." Here again, however, the compiler of the Dictionary leaves something to be desired in his information, for he does not vouchsafe any hint as to the best method of "exhibiting" the prescription to a stranger whom one wishes to annoy without the risk of detection. Before going on to the article "Sabbat," we may pause to notice the deserved praise given by the Dictionary in connexion with the "Sabbat" to that perhaps underrated creature the snail. Under the heading "Eacargots" we find that no one has ever accused these good creatures of taking part in these diabolical rites; but it is remarked that they, too, have their mysterious side—an assertion which is oddly enough based on the old story of so-called sympathetic snails, and illustrated by one of the very oddest pictures in the volume. The article on the Sabbath itself is chiefly remarkable for a story of which we propose to give the gist. Charles II., Duke of Lorraine, travelling in disguise over his dominions, found a lodging one night in a farmer's house. He was surprised to find that, after he had supped, a second supper far more carefully

prepared than his own was laid on the table. He asked the farmer if he expected more guests. "No," replied the farmer; "but it is Friday, and every week on this day and at this hour the demons have an interview with the wizards of the neighbourhood in the forest hard by. They dance the devils' dance, and then break up into four bands. The first of these bands comes to supper here, the other three go to farms not far from mine." On this Charles inquired if they paid for what they ate. "On the contrary," replied the farmer, "they carry off whatever they may take a fancy to, and if they choose to be discontented with what we give them, we have a bad time of it. What can one do when one has to deal with wizards and demons?" After hearing this, "le prince, étonné, voulut approfondir ce mystère." He sent off one of his followers to ride full speed to Toul, about three leagues distant. About two in the morning, a crowd of wizards, witches, and demons came into the farmhouse. Some were got up to look like bears, some had horns, and some had claws. No sooner had they sat down to the supper prepared for them than Charles's equerry reappeared followed by a troop of gendarmes. The Duke then observed, with great good sense, that this sitting down to supper of sorcerers and demons was very incongruous, and had them all arrested. More arrests followed this, and the demoniacal celebrators of the "Sabbat" turned out to be a company of brigands, who found an easy way to pillage in their diabolical disguise. "Le duc de Lorraine (qui avait généreusement payé son souper avant de quitter la ferme) fit punir ces prétendus sorciers et démons comme des coquins et des misérables. Le voisinage fut délivré pour le moment de ses craintes, mais la peur du Sabbat ne s'affaiblit pas pour cela dans la Lorraine."

Modern cases of sorcery, under a newfangled name, in which the wizard's mask has been assumed for purposes not altogether dissimilar to those of the rogues and vagabonds here spoken of, will, no doubt, be fresh in the recollection of many of our readers. It is only to be regretted that some such high-handed course as the one just described was not, or could not be, taken with the more modern pretenders to supernatural powers. As to these the Dictionary is prudently reticent. It recites the too well-known facts about the "Fox manifestations"; says nothing, under the heading "Spiritisme," of the latest "developments," and ends up with a reference to the "admirable little book" in which Father Matignon makes the way clear in these matters for sober-minded persons. It is much the same with the article "Tables," which ends up with an appeal to the faithful to remember that "the Church has formally condemned and rigorously forbidden this dangerous commerce with demons, who are the real agents in these tricks." Shortly after this, we come upon some interesting information concerning "Tap or Gaap." This personage is "grand president and grand prince" in the lower regions. When he assumes human shape it is at noon. Four of the chiefs of the infernal empire are under his orders. He is as powerful as Byleth, who, as we find on referring to the appropriate heading, is a strong and terrible demon, who rides on a white horse, preceded by cats playing on the horn and the trumpet. Tap or Gaap used to have holocausts and libations offered to him by magicians, who called him up by means of a formula which they said was discovered by Solomon. This, however, was a delusion; for it is well known to the *Dictionnaire Infernal* that it was Iiam who first understood the art of summoning evil spirits, and that Byleth was specially devoted to his service. Byleth and Gaap, or Tap, seem to be not on the best of terms between themselves; for, if an exorcist is acquainted with the great arts of Byleth, he will be safe from any intrusion on the part of Tap. In dealing with Byleth, on the other hand, the greatest prudence is necessary; for, although he obeys the call of the wizard, he does so in a state of great fury. The formula for invoking him is given at length. The operator must hold in his hand a hazel wand, and, turning to a point between the east and the south, must trace a triangle outside the magic circle, within which he has placed himself as a matter of course. Then he reads the magic formula which brings spirits from the vasty deep, and then Byleth arrives, in a submissive attitude, within the triangle. If, it is prudently added, he does not arrive, why then the exorcist may conclude that the powers below have little respect for him. This reminds us of a personal experience detailed by one who, in the vigils of the night, over a dying camp fire in the midst of a forest, resolved to try if he could realize the idea of Mr. Browning's poem on mesmerism. The effect of the narration was increased by the foreign speech of the narrator, who was a Norseman. "Under that beautiful sky," he said, "and with the great arms of the trees waving above me, and the dying embers of the fire, and everybody asleep all round me, I tried if I could not do this thing. I wished and I wished, so strong as ever as I could wish, and I wished like that for ever so long in that solitude, and, by Jupiter, nothing never came of it." This same chance, we fear, is likely, to judge from the cautious tone of the *Dictionnaire Infernal*, to befall the too-confident invoker of Byleth. If Byleth does respond to the invocation, he must be treated much as a certain modern "Spiritualist" had, according to the account of the "spirits," to be treated. The "medium" had been in a trance for some time, and the "spirits," who had given a good deal of information through his mouth, completed their communications by observing that "when Daniel returns (from the trance) he must have a good glass of wine." In like manner, when Byleth appears, it is well at once to offer him a glass of wine, which,

however, must be carefully placed within the limits of the triangle. It is also desirable to tell him how well he is looking, and in a general way to make much of him and of his immediate associates in the place whence he has come. Further, when conversing with Byleth one should wear a silver ring on the middle finger of the left hand, and keep it turned towards him. If, the Dictionary continues, these precautions are troublesome, the trouble is worth taking, for he who commands the services of Byleth will become the most powerful of men. He—Byleth—we learn in addition, "espère un jour remonter dans le ciel sur le septième trône; ce qui n'est guère croyable." One can only hope that there may yet be a chance for Byleth in the same spirit which moved the Scotch minister concerning "the puir deil."

#### TRAINING.

WE have before now spoken of the singular views which have prevailed with regard to the diet best suited for men who were desirous of developing their physical powers to the highest degree, and of the harm which has been done by the empirical, and in many cases ridiculous, rules which were laid down. Some of the most objectionable of these are now happily set aside, and the opinions of those intelligent persons who taught that mutton was better than beef for "wind," that all fluids should be avoided by men who wish to "get into condition," that meat was to be eaten without salt, and that pedestrians should drink sherry and boxers port, would be laughed at, even by the most ardent fanatic in an Eight; but, though a good deal of nonsense has been got rid of, a bad system still prevails, and there is no exaggeration in stating that harm is still done by the regulations respecting diet which, even in these days, are unhesitatingly obeyed. At one time, no doubt, some of these rules appeared to have a certain scientific sanction; but it has now been well established that the views on which this sanction was based were not only erroneous, but directly opposed to the truth. In so far, therefore, as rules which are in accordance with them have any effect, they must have a bad effect. It is true that they do not work so much ill as might be expected, but this is because the men who follow them are usually very young, very vigorous, and lead, apart from diet, a most healthy life. Still, unless modern physiological teaching is altogether wrong, even the modified system now followed must cause some evil, and the sooner it is swept away the better. If it be said that the men who train steadily often attain very "high condition," the answer is that this is due in no way to their food, but to constant and fitting exercise in the open air, to regular hours, to strict temperance with regard to alcohol, and to abstinence from or great moderation in smoking. Strength is attained not by diet, but in spite of diet.

That erroneous views should at one time have been held is not wonderful, for in support of them the great name of Liebig could be quoted by those who had sufficient energy and intelligence to attempt a scientific study of the question. It is now, however, well established that in some of his conclusions Liebig was wrong, and notably that he was wrong in thinking that muscular or mechanical effort was entirely supported by nitrogenous food, and that the heat-giving foods sustained the process of combustion which is constantly going on in the body, but did nothing more. If he was right, of course the more muscular work a man did the more nitrogenous food he would require; and trainers were therefore not mistaken in favouring meat, and in looking with great dislike on those foods which are commonly thought to produce fat; but then, unfortunately, Liebig has been shown to have been in error, and any system of diet which is in accordance with his views cannot be a good one, and is in all probability a very bad one. The erroneous nature of views based on Liebig's doctrine is well known to physiologists; but, nevertheless, is hardly as yet so generally known as it ought to be, and very likely on the banks of Isis and Cam there is no suspicion of the truth. Possibly every year a certain number of men break down in training, with more or less injury to their constitutions, owing to a faulty diet. Instruction on this subject is therefore anything but superfluous, as a deeply rooted error is not by any means eradicated; and all who are interested in athletic sports should welcome the appearance of two articles which a writer on physiology of the first eminence has contributed to Mr. Richard Proctor's new magazine *Knowledge*—a periodical, we may observe, which promises to satisfy a want that has long been felt. In this magazine Dr. Carpenter has come forward to protest against the belief in Liebig's views which appears unfortunately still to exist. As need hardly be said, he does not write specially on training or diet, but generally respecting food material and physical effort, his articles being on "The Relation of Food to Muscular Work." They are written with all his accustomed clearness and powerful simplicity, and we hope to aid in calling attention to them, as they cannot fail to do much good if they reach those who habitually misfeed young men with a view to producing "high condition."

Dr. Carpenter has lately found, to his great surprise apparently, that Liebig's doctrine "as to the direct dependence of muscular energy on the expenditure of nitrogenous food" was still put forward as an accepted physiological verity, and this has induced him to take up the subject, which he certainly treats in such a manner as to leave no excuse for error in future. After pointing out that Liebig made several serious mistakes when he wrote on biology,

he goes on to say that the German chemist's famous division of food material into "tissue-forming" and "heat-producing" was a great advance, but that, in some of the views which were partly founded on this, Liebig was wrong. He thought that the only purpose served by the burning up within the body of the non-nitrogenous components of food in combination with the oxygen of the air was the production of heat, and that it had nothing to do with mechanical force. This, he believed, was "the product of a transformation of living muscular fibre into dead," and he thought that he discovered, in increased excretion of urea after severe exertion, a distinct proof of the truth of his hypothesis. Dr. Carpenter shows that this hypothesis has been proved to be altogether wrong. From the first it was seen that some indisputable facts were not reconcilable with it, and in 1845 Mayer, whom Dr. Carpenter quotes, laid down that chemical force in ingested food and inhaled oxygen was the source of the motion and heat which are the two products of animal life, and made a comparison, which has since been elaborated and become famous, of the body to a steam-engine. According to this, non-nitrogenous food represents the fuel, and nitrogenous the metal of the boilers and cylinders. When there is a great development of force there will be a large increase in the consumption of the former, but only a slight increase in the consumption of the latter, due to extra wear and tear. It cannot be said, however, that the views which this figure of speech, after a fashion, expresses, were shown to be true, or that Liebig's doctrine was definitely disproved until long after Mayer wrote. In 1866 Professors Fick and Widalienus made their memorable ascent of the Faulhorn, distilling themselves with the greatest care, and using the most rigorous methods to ascertain exactly the consumption of muscle-substance. Their experiment is, of course, perfectly familiar to scientific physiologists, and has been described and commented on again and again. As, however, the error which Liebig propagated still lives, it is well that attention should still be drawn to the analysis which served more than ought else to show the fallacy of his doctrine, and Dr. Carpenter has done well, therefore, to give an account of this celebrated investigation. We cannot do better than quote his description. He says:—

An experiment which has now become "classical" was performed upon themselves by Professors Fick and Widalienus in 1866; namely, the determination of the respective quantities of urea eliminated by each of them for twelve hours before, for eight hours during, and for six hours after the ascent of the Faulhorn, whose height is about 6,500 feet. They took no nitrogenous food either for seventeen hours before the ascent, during the eight hours of the ascent, or for six hours after the ascent; but then took a good ordinary meal. The mean of the two determinations (between which there was a very close correspondence) gave for the twelve hours before the ascent, 0.62 grammes, being at the rate of 0.052 grammes per hour; for the eight hours of the ascent 0.40 grammes, or at the rate of 0.05 grammes per hour; and the same amount for the six hours following the ascent, being at the rate of 0.066 grammes per hour; while for the twelve hours after the subsequent meal, the mean amount was 0.48 grammes, or at the rate of 0.04 grammes per hour. There was thus a positive reduction in the amount of urea eliminated, which was probably attributable to the temporary abstinence from nitrogenous aliment; since the results of subsequent observations carried on for a much longer period upon men going through severe exertion upon an ordinary diet (as those made by Dr. Austin Flint, of New York, upon Weston, the pedestrian, during a five days' walk of 320 miles), show a slight total increase in the elimination, which is fairly attributable to the general "wear and tear" produced by the excessive strain put upon the machine.—There is, then, no foundation whatever for the assumption of Liebig that every exertion of muscular energy involves the death and disintegration of an equivalent amount of muscle-substance.

In spite, however, of the conclusive nature of this experiment and of others, doubts as to the results obtained were, if we remember rightly, occasionally expressed up to a comparatively recent time. Now, however, it is impossible to suppose that any doubt on the subject exists amongst those who have made biology their study. Still, Liebig's error cannot be considered as exploded. The sanction of a great name keeps it alive, and a large number of men who ought to know better still believe that for heavy muscular work much meat is necessary. They are well-nigh as wrong as Falstaff was when he held that wine strengthened the blood. Liebig's doctrine is nearly the very opposite of the truth. It is not necessary to reproduce here the careful and minute account which Dr. Carpenter gives of the process involved in muscular effort. Those who wish to understand this must seek the pages of *Knowledge*, and they will be very well repaid for their pains. His summing-up, however, which states briefly the views of modern physiologists, should be given in his own words, which are as follows:—

The mechanical working of the body of a living animal is as directly dependent as its heating upon the oxidation of the hydro-carbons of its food; and these may be most economically supplied by non-nitrogenous substances. On the other hand, the mechanism can only be kept in working order by the continual renovation of its substance (its very existence as a living whole involving the continual death and decay of its component parts); and for this renovation a supply of *proteids* is essential, with a certain admixture of fat to serve as material for protoplasm.

Now it is scarcely necessary to point out how entirely these truths are opposed to the system followed in training, which did seem to receive some kind of sanction from Liebig. It is true, no doubt, that nitrogenous food is required for the renovation of the muscle, which wears out as all the tissues of the body wear out; but the consumption of muscle caused by effort—which, as we have said, has been likened to the wear and tear of a machine—is small when compared with the consumption of the non-nitrogenous substances, which represent the fuel that is burnt

to maintain the force developed. It is therefore clear that when there is severe and continuous physical effort, a large supply of the latter kind of food-material will be required to make good the loss occasioned by that effort, while of the former only a slight increase will be made necessary. The principle followed in training is exactly to reverse things. It is true that men are no longer encouraged to gorge themselves with underdone meat and to avoid sweets as if they were poison; but still, in the main, the trainer favours meat, and watches with some jealousy and restricts the other kinds of food. He ought to do just the opposite. We do not, of course, mean to say that the resources of the French *cuisine* should be placed at the disposal of young men in training, as it is sufficiently obvious that those who desire to attain a high state of health must confine themselves to simple and digestible food; but of simple food it is the non-nitrogenous kind that is the most needful, and it is about as reasonable to fear a large proportion of nutriment of this class as it would be to fear the oxygen of the air. Nay, more harm may be done by abstaining from the food indicated. Natural laws cannot be disobeyed with impunity; and when nature points distinctly to one kind of diet, and men choose to adhere to a diet of precisely the opposite kind, evil of some sort is not unlikely to follow. The argument that the diet is right because men who adopt it do get into "high condition" we have already answered, and there can be little doubt that the ailments which assail men in training and the occasionally serious results of training are in part due to a vicious system of diet which, in so far as it has any scientific basis, is founded on a doctrine which is now thoroughly exploded. Much, therefore, do we hope that Dr. Carpenter's valuable contributions to *Knowledge* will be read at the Universities and other places where there is devotion to the severer kinds of athletics. If these and some other writings are studied, we doubt not that before long the foolish rules which still remain will be swept away, and that the happy young athletes who are able to enjoy good and wholesome dinners, which tend to produce, not to retard, the much desired "condition," will fervently revere the name of the man of science who released the victims of training from an odious thralldom.

#### THE ECONOMIC PROBLEMS BEFORE THE NEW FRENCH GOVERNMENT.

FOR the first time since the fall of the Empire France has a Government which is presumably strong enough to frame and to carry a policy looking only to the true and permanent interests of the country. Apart from politics, the problems awaiting solution from such a Ministry are numerous and important. First amongst them is the conclusion of commercial treaties with England and the other countries trading with France. The Cabinets which have succeeded one another of late years have not had the strength to disregard the Protectionist coteries which make so much noise in proportion to their limited following in the country. They knew the energy and perseverance of the Protectionists and the apathy of the great mass of consumers, and they feared the hostility of the former more than they valued the good will of the latter. M. Gambetta, however, is probably powerful enough to disregard the manoeuvres of the Protectionists, and to look only to the true interests of France. He is an avowed Free-trader, and is therefore likely to favour a more liberal tariff than M. Tirard's. Nor is he ignorant of economic subjects. While he was contending against the monarchial parties he got himself chosen chairman of the Budget Committee, knowing that, as all measures in the long run cost money, he would thus be in the best possible position to counteract the plans of his opponents and to further his own views. Therefore he comes to the question not without preparation. Besides, as Minister for Foreign Affairs, he may be supposed to feel the desirableness of rescuing France from the isolation in which she now is, and of re-establishing the close relations which formerly subsisted between her and this country. At the Lord Mayor's banquet last week Lord Granville spoke with much hope of the prospects of the treaty with France, and this hope can only have been founded on the supposed desire of M. Gambetta to conclude a more liberal treaty.

A second task is the conversion of the Five per Cents. For several years now the price of the Five per Cents has ranged from 115 to 120, proving conclusively that the conversion is in the nature of things practicable. During all those years the French taxpayers have been paying to the holders of these bonds a larger interest than they need have paid. But, for various reasons, the interests of the taxpayers have been subordinated to those of the rentiers. M. Gambetta himself largely contributed to this state of things. In his famous speech at Romans he publicly protested against the conversion of the Five per Cents, arguing that it would be unjust to those who had come forward to enable France to liberate the territory held by the Germans if the interest paid to them was reduced. It was understood at the time that M. Gambetta's eagerness on behalf of the rentiers was inspired by purely political motives: the peasants were large holders of the Five per Cents, and he feared that a reduction of interest would offend these holders, who had not then been quite won over to the Republic. The peasants now, however, have fully rallied to the Republic, and there can be no sufficient reason for continuing longer to pay them 5 per cent. at the expense of the general taxpayer. Besides, M. Gambetta has it in his power to compensate them for the loss of

interest by reducing at the same time the Land-tax. Apart altogether from the desirableness of preventing any ill feeling amongst the peasants, it is very proper that the Land-tax should be reduced. In several departments it is said that it amounts to four and even five shillings in the pound, which is certainly an excessive charge, and ought to be reduced. It would be possible to effect the reduction if the Five per Cents. were converted. It may be objected that the present is not a good opportunity to propose a conversion, when the price of the stock is considerably lower than it was a few months ago. But the fall in the price has partly been brought about by Stock Exchange considerations alone, and partly it is the result of the formation of M. Gambetta's Ministry. It has for some time come to be supposed that the conversion of the Five per Cents. was postponed only until M. Gambetta came into office; that, in fact, he was reserving it as one of the great measures of his administration; and naturally, therefore, as soon as his accession to power became certain, the price of the stock declined. Nor would a postponement of the measure now be enough to cause a recovery in the price, unless, indeed, it were in some way officially announced that the postponement was for a considerable time. That the conversion could be effected there can be no reasonable doubt. The price of the Three per Cents. is much more material in considering this question than the price of the Five per Cents. The price of the Three per Cents. at the end of last week was between 85 and 86. In other words, the Three per Cents. yielded on the market price just  $3\frac{1}{2}$  per cent. to the investor. The Three per Cents. themselves, however, have been kept down by the existence of the Fives, for the Fives have all along yielded more than 4 per cent. There was, of course, the danger that the Five per Cents. might at any moment be converted, and therefore, although they yielded for the time being 4 per cent. and over, the investor risked a serious loss of capital, as on conversion he would be paid off at par. Still the higher yield of the Five per Cents. attracted many purchasers from the Three per Cents., and kept the price of the latter down. Yet even now, with all the difficulties there are upon the Bourse in Paris, the Three per Cents. yield to the investor only about  $3\frac{1}{2}$  per cent. It is perfectly plain, therefore, that the Five per Cents. might be refunded at  $3\frac{1}{2}$  per cent. Whether the new Ministry—assuming that it has courage for the task—will issue a  $3\frac{1}{2}$  per cent. or a 4 per cent. bond, or will prefer to reduce at once to 3 per cent. at a discount, remains to be seen. It appears to us that it would be easier to refund at  $3\frac{1}{2}$  per cent. at par. But we need not discuss that question now. In his declaration of policy read to the Chamber on Tuesday, M. Gambetta makes no reference to this question of conversion. But it can hardly be assumed that he will go on extracting from the overburdened taxpayers three or four millions sterling more than they ought to pay.

More important, however, than the conversion of the Five per Cents. is the reform of the existing system of taxation in France. After the war, when the annual expenditure was increased about 50 per cent., the necessity of meeting the new charges thrown upon the country compelled the National Assembly to impose taxes upon almost every conceivable object. There was no time to think of political economy when the solvency of France had to be maintained. Accordingly, taxes the most mischievous and most injurious to industry were imposed. Since then, indeed, the astonishing growth of prosperity due to the vast resources of the country and the untiring industry and self-denying thrift of the people, has enabled the taxation to be borne with surprising ease, and year after year there have been large surpluses. Consequently, the Government has been able to remit some of the worst of the taxes imposed before 1875. Still, however, the remissions have not been made upon any system, and the taxation is full of anomalies, as well as in many respects oppressive to industry. A great financial genius, therefore, would endeavour to recast the whole system. During the late elections there was much talk of the imposition of an income-tax for the purpose of reforming the whole taxation of the country, as was done by Sir Robert Peel in this country. It is doubtful, however, whether M. Gambetta will venture upon so strong a measure, although he was at one time known to be favourable to it. But whether there is need for an income-tax, or whether, as many able economists contend, all that is necessary could be done by the help of the surpluses yielded every year, and of the free revenue obtained by the conversion of the Five per Cents., a reform of the system of taxation ought to be taken in hand, and no part of the system requires reform more urgently than the land-tax. The cadastral survey of France upon which the land-tax is based consumed a great many years before it was completed, and consequently the incidence of the tax is most unequal. In some departments, as we have already said, it amounts to four and even five shillings in the pound; while in others, again, it is said not to be a shilling in the pound. For a long time, therefore, there has been an agitation for a new survey, and no doubt a new survey ought to be instituted. But this would occupy much time, and what is now needed is a prompt equalization of the incidence of the tax. It does not seem impossible to remedy at least the most glaring injustices without waiting for a new survey; and this attempt to equalize the incidence of the tax would be a supplement to the reduction of which we have already spoken as a consequence of the conversion of the Five per Cents. M. Gambetta, in fact, seems to promise this when he pledges himself "to alleviate, without compromising the finances, the burdens which weigh upon agriculture."

Lastly, a task not less important than any we have referred to is the extension, or rather perhaps we should say the establishment, of local self-government in France. At present there are over thirty-six thousand communes in France; but more than sixteen thousand of these have less than five hundred inhabitants, and over twenty-seven thousand have less than a thousand inhabitants, while more than thirty-four thousand of them have less than three thousand. It is quite clear that in districts so small as these, were the law ever so good, it would be impossible to establish an effective local government. The population is too small to furnish the kind of men required for administrative purposes. Therefore, the communes should be amalgamated, or a number of the smaller ones should be grouped together so as to form unions large enough to give a chance of furnishing capable and honest administrators. In addition, communes should have the power of rating themselves. At present the communes receive subventions from the State; but the system is altogether wrong, and some portion of the local revenues should be handed over to the local bodies to discharge purely local functions. Further, the power of the *mairies* should be diminished, while the powers of the Municipal Councils should be increased. In short, the whole subject of municipal or local government in France requires reform. It is at present chiefly regulated by laws passed under the First and Second Empires, which are now obsolete, and are indeed inconsistent with the Republican institutions of the country. The National Assembly extended the powers of the Municipal Councils, and so did Acts passed by the later Assemblies; but still the whole system wants revision and reform. One great difficulty in the way of reform no doubt is that, if the power of taxation for school and sanitary purposes is vested in the Municipal Councils, they may be too niggardly to provide properly for education and sanitation. But it ought not to be beyond the power of Government to guard against this danger, just as it is guarded against amongst ourselves. It will be seen, then, that the field of domestic reform before a great and capable Ministry is very large in France, and that, in fact, almost all the work which has been done in England since the first Reform Act is still awaiting the hands of the reformer in France.

## REVIEWS.

### MORLEY'S LIFE OF COBDEN.\*

MR. MORLEY has not disappointed the high expectations which were justified by his former essays in political biography. In his Life of Burke he had proved his ability to appreciate the character and genius of a statesman whose opinions in one part of his career differed widely from his own. With his present subject he is in more perfect or more continuous sympathy; for Cobden's doctrines and aspirations, though they may not have been so extensive as his biographer's, are all included in Mr. Morley's political creed. It may be added that neither theories nor efforts to apply them to practice exhaust the interest of personal history. What a man did, however important it may have been to the world, concerns the student of character chiefly as an illustration of what the man was in himself. Mr. Morley unnecessarily apologizes for mentioning some facts relating to Cobden's private circumstances. His story would have been incomplete if he had not shown that Cobden was able to receive, on more than one occasion, pecuniary aid from public and private friends without in any way compromising his dignity or independence. The few passages which disclose portions of his domestic and social life are the most interesting parts of a book which is nowhere tedious or dull. Mr. Morley confirms the uniform tradition of his kindly disposition and of the variety and freshness of his conversation. "I was introduced to Mr. Cobden," said a lady of good judgment in a Memoir published some years ago, "and found him a poetical, imaginative man, talking with the greatest delight of Egypt, where he has not been." "He had," according to Mr. Morley, "a large and powerful head, and the indescribable charm of a candid eye. His features were not of a commanding type, but they were well illuminated and rendered attractive by the brightness of intelligence, of sympathy, and of earnestness. About the mouth there was a curiously winning mobility and play." The extreme bitterness of his tones when he was denouncing the landed gentry or his other opponents may be mentioned in connexion with Mr. Morley's statement that "his voice was clear, varied in its tones, sweet and penetrating." No popular speaker has ever relied more habitually on closeness of argument; but his invective was full of angry feeling. "Of nervous fire he had abundance, though it was not the fire which flames up in the radiant colours of a strong imagination. It was rather the glow of a thoroughly convinced reason, of intellectual superiority, of argumentative keenness. . . . I have asked many scores of those who knew him, Conservatives as well as Liberals, what this secret was; and in no single case did my interlocutor fail to begin, and in nearly every case he ended as he had begun, with the word *persuasiveness*." *Mérimée*, who seldom spoke well of an Englishman, said, as quoted by Mr. Morley, that Cobden "was a

\* *The Life of Richard Cobden*. By John Morley. 2 vols. London: Chapman & Hall, Limited.

man of an extremely interesting mind, quite the opposite of "an Englishman in this respect, that you never hear him talk common-places, and that he has few prejudices." Mr. Morley has been misled by a blunder of Mr. George Combe's into ascribing to "some great lady" the phrase that Cobden's policy "never rose beyond a bagman's millennium." The sneer is supposed to proceed from "the class whose lives are one long course of indolence, dilettantism, and sensuality." The lady, whatever may have been her own vices or those of her class, was only quoting the saying of one who belonged to a different class, and who was certainly not given to indolence or sensuality. Carlyle, in a moment of irritation caused by injudicious and prolonged eulogies on Cobden, once propounded the paradox that he was "an inspired bagman who believed in a calico millennium." At other times he did fuller justice to the great champion of free trade; but his epigram naturally survived the expression of his serious judgment.

Mr. Morley allows O'Connell the first rank in the list of agitators, and assigns to Cobden the second. The repeal of the Corn Laws may be placed on a level with Catholic Emancipation. In the failure of other movements the successful leaders of the two great popular associations shared the same fortune. In other respects the resemblance is superficial or non-existent. O'Connell had all the qualities and defects of a demagogue. Cobden never compromised his character for honesty or his self-respect. He and his celebrated ally, though they are among the most powerful and famous of agitators, are also the purest; and Cobden was superior to all competitors in general moderation and fairness. Even during the short period of his unpopularity at the time of the Crimean war, Cobden always commanded, as he candidly acknowledged, the attention and respect of the House of Commons. From his first entrance into Parliament, his upright character and his intellectual power were fully recognized. No man doubted his sincere belief in a millennium, though it might be erroneously supposed to consist of calico. Even if he had not been supported by a great material force out of doors, Cobden would have been after his second or third Session regarded as a Parliamentary leader. His estimate of the rival or predecessor with whom he was often compared throws remarkable light on his own character. "I found," he says in a letter to George Combe, "the populace of Ireland represented in the House by a body of men, with O'Connell at their head, with whom I could feel no more sympathy or identity than with people whose language I did not understand. In fact, *morally*, I felt a complete antagonism and repulsion towards them. O'Connell always treated me with friendly attention, but I never shook hands with him or faced his smile without a feeling of insecurity; and, as for trusting him on any public question where his vanity or passions might interpose, I should as soon have thought of alliance with an Ashantee chief." Mr. Morley adds the strange comment that "Cobden is here unjust to O'Connell. He opposed the Corn Bill of 1815, and was true to the League in the fight from 1838 to 1846." It was surely possible that a demagogue with the morals of an African savage might take the right side on one political question. Cobden himself had, with questionable propriety, subscribed to O'Connell's rent. He was not bound to think every opponent of the Corn Law or every adherent of the League an honest man. His judgment of O'Connell was substantially just, though it was perhaps coloured by a conscious antipathy of nature. It is probable that he would feel but little sympathy with the present representatives of the populace of Ireland.

In recording the victory of the Corn Law League, Mr. Morley deliberately abstains from arguing questions which are no longer subjects of serious controversy, or from writing a handbook of political economy. Cobden admitted that he and his friends began the agitation with a belief that they were vindicating the rights and interests of their own class against an oppressive monopoly. During the progress of the contest his views gradually enlarged into a belief, which was sometimes exaggerated or premature, that freedom of trade was the essential condition of international co-operation and harmony. It was impossible that he should avoid illusions, or that he should always do justice to opponents. When Peel began his wise and comprehensive reforms of the tariff, Cobden seems to have perversely dwelt on the inconsistency of reducing or abolishing minor duties while the first necessity of life was heavily taxed. With stranger blindness he joined in the clamour against the Income-tax, which was the necessary instrument of all fiscal reform. At a later period he became an advocate of direct taxation; but he never seems to have understood the true principle of equal assessment. It was not until Peel avowed his conversion to the principle of free trade in corn that Cobden recognised his disinterested sagacity. It fortunately happened that at the same time Peel repeated in plainer terms his retraction of a charge which Cobden had deeply resented. Mr. Morley publishes for the first time a remarkable letter, in which Cobden privately proposed to Peel that, after the passing of the Corn Bill, he should appeal to the country by a dissolution, and place himself at the head of the middle-class Liberals in opposition to the combined Protectionists and Whigs. To the end of his life Cobden regarded Peel as the best and greatest statesman of his time. With Lord John Russell he had but a faint and intermittent sympathy; and he entertained the strongest political aversion to Lord Palmerston. In his later years, he seems to have preferred Disraeli to both the Whig leaders.

Fourteen years intervened between the great triumph of the League and Cobden's second great achievement. Mr. Morley, who has had the advantage of consulting Cobden's friend and

colleague, Sir Louis Mallet, corrects the common impression that the Emperor of the French was the first to conceive the project of the Commercial Treaty. The scheme originated, in conversations between M. Chevalier and Cobden, who communicated the notion to Mr. Gladstone. Next to Cobden himself, the chief promoter of the treaty, was M. Rouher, who counteracted the impressions on the Emperor's mind which were produced by the remonstrances of his Protectionist colleagues. Cobden himself had the merit of convincing Napoleon III. of the advantage which the French nation would derive from extended commerce with England. His own object was rather political than economical, for he overrated the efficiency of trading interests in securing international peace. In his own Government he had no cordial supporter except Mr. Gladstone; and he complained that the Foreign Office, then administered by Lord John Russell, allowed him less discretion than that which he had exercised when he was travelling for a firm of calico-printers at the age of twenty. His correspondence at the time teems with angry denunciations of Lord Palmerston, who frequently expressed in Parliament his suspicions of ambitious designs on the part of the French Emperor, and who carried through Parliament a Bill for expending several millions on defensive fortifications. The precautions of the English Government may perhaps have rendered Cobden's negotiations more difficult; but the result showed that Lord Palmerston's measures were not incompatible with the simultaneous policy of Cobden and Mr. Gladstone. Mr. Morley publishes an admirable letter written by Lord John Russell in answer to Cobden's remonstrances. The Minister declined to be dependent on the forbearance of a foreign potentate who might perhaps have been tempted to encroachment against an unarmed neighbour. In 1859 the Emperor had professed peaceable intentions up to the eve of his declaration of war against Austria; and in 1860 he had suddenly taken possession of Savoy and Nice. Notwithstanding Cobden's prejudices, the preparations of the English Government may have had something to do with the maintenance of peace. His violent opposition to the organization of the Volunteer force was in the highest degree unreasonable. After an experience of twenty years, there is a unanimous belief that a system which combines opportunities of manly recreation with security against possible dangers is beneficial to the country.

It is not a little remarkable that a politician of extraordinary ability who more than once achieved great success should have devoted a large portion of his time and energy to abortive enterprises. During the latter part of the Corn Law agitation and in the following years Cobden founded the most sanguine hopes on a chimerical project of swamping the county representation by means of faggot votes. Artisans were exhorted to invest their savings in freehold houses, which would, if they were to be scattered over country districts, have formed the most precarious of properties. It is evident that if the contrivance had in the first instance proved effectual, the landowners could have easily outbid and outnumbered the intruders from the manufacturing towns; nor was it probable that rural constituencies would have tamely surrendered their rights. The principal result of the agitation was to disgust the people of Lancashire with the dictation of the League, which immediately before a general election announced that the representation of the county was to be divided between Manchester and Liverpool. Fortunately both the nominees of the great towns were defeated by more legitimate candidates. Cobden's conscientious propagation of the doctrines of peace was scarcely more prosperous; and there is reason to believe that it was one of the causes of the Russian war. Mr. Kinglake truly declares, in a passage quoted by Mr. Morley, that the Peace party was powerless to oppose the war because it had denounced all wars. It is true that Cobden's opposition to war was rather economical than sentimental, but he was associated with fanatics who had renounced all sense of national honour. His friend and follower Mr. Gilpin published a pamphlet in which some philanthropic wiseacre undertook to prove that it would cost less to submit to an invader than to resist him by arms. Cobden unwillingly admitted that the war with Russia was from beginning to end deeply and almost universally popular. The last great controversies in which he had to take part were caused by the American Civil War and by the Danish complication. During the earlier part of the American struggle he consistently recommended acquiescence in the secession of the Southern States; but his sympathies were afterwards enlisted on the side of the North by the proclamation for emancipating the slaves; and he was probably influenced by Mr. Bright's passionate devotion to the cause of the Union. He had twice visited the States, and he heartily sympathized with their institutions. In one of his letters he says that as an Englishman he has no ambitious desires, but that the case would have been different if he had been an American "like Charles Sumner or Amasa Walker." Amasa Walker, whoever he may have been, is long since forgotten. Charles Sumner is principally remembered by his profligate attempt to engage his country in war with England on the shameless pretext of the indirect claims. There could be no doubt that Cobden would strenuously oppose the intervention of England in the quarrel between Germany and Denmark. He perhaps shared with the pacific majority of the Cabinet imperfect knowledge of the merits of a question in which the aggressor for once was in the right; but he appreciated more justly than Lord Palmerston and Lord Russell the danger of a rupture with Germany.

It appears from Mr. Morley's narrative that Cobden, during

nearly the whole of his political life, abstained from organic agitation, though he shared the opinions of his more pugnacious friend and colleague on the theory of representation. In an early letter Cobden says that he approves in principle of universal suffrage and of republican institutions, but that he confines his efforts to a different class of political objects. From time to time he expressed a doubt whether the masses of the people were more enlightened than the governing aristocracy, to which he was irreconcilably hostile. He was profoundly impressed with the enthusiastic reception accorded to the Duke of Wellington at the opening of the Exhibition of 1851. When the Duke died, a few months later, he allowed that no representative of the warlike spirit had ever been more simple or more upright. Only a few years before he had, with ill feeling and bad taste, of which he was seldom guilty, publicly declared that the Duke was in his dotage because he had recommended, in his celebrated letter to Sir John Burgoyne, additional preparations for national defence. Cobden's political hostility to Lord Palmerston was deeper and more permanent; yet he ultimately arrived at the conclusion that his lifelong antagonist was, like himself, sincere. It would be tedious, if it were practicable, to notice all the varieties of Cobden's political activity. Mr. Morley's masterly work will perpetuate the memory of his achievements, and it may perhaps involuntarily disguise his not infrequent failures. No candid reader of the book can doubt either the honesty of Cobden's motives or the greatness of his intellectual qualities. It may be added that in his lifetime he commanded universal respect, and that the current of opinion since his death has tended to ample recognition of his merits. He was, on the whole, enviable in his public career and in his private life; nor has any one of his contemporaries thus far been so fortunate in a biographer.

#### THE EASTERN MENACE.\*

WE cannot congratulate Colonel Cory on the form which he has given to this book, though we are ready to admit that there are many excuses for him. He wrote in 1876 a book with a title, or at least a second title, like that of the present volume. The intervening five years have naturally strengthened his case, and provided him with the opportunity of saying "I told you so" with rather unusual force. His original volume is out of print, and he feels that some kind of re-issue of it is desirable. But at this point his difficulties begin. He cannot resist the temptation of keeping a considerable portion of what he then wrote, and he cannot resign himself to the necessity of writing a new book. So, trusting in that most fatal of all maxims, *medio tutissimè*, he tries to make a compromise. He keeps the 1876 body, and puts upon it an 1881 head. He has added, he tells us, a third of new matter; and, though we cannot pretend to have verified the statement, we have not the least reason for disbelieving it. But the inevitable result is a succession of gaps and a recurrence of inconsequences in the reasoning. At one moment references to a present state of things apply to 1876; at another they apply to 1881. Now we have to consider the state of affairs as dominated by the desire of Lord Beaconsfield to make England strong and respected; now to consider it as dominated by the desire of Mr. Gladstone to administer delicate soothing to the national conscience. The condition of the reader may best be described by the analogy of a man who looks through an opera-glass the focus of which is being constantly, and almost without warning, shifted.

To these inconveniences of the present edition or re-issue have to be added certain drawbacks which appear to have been integral parts of the original work. Colonel Cory, with the best intentions in the world, appears not to have mastered that fundamental principle of sport and literature which deprecates the hunting of half a dozen hares at once. From the incorporation of at least one paper which has undoubtedly and professedly done duty as an article in a periodical, we are led to suspect that the book, as a whole, has something of the character of a conglomerate. The result is not satisfactory. There is no doubt that such subjects as the injustice done to the old Company's servants, both before and after the Mutiny; the drawbacks of short service; the insufficiency of the Staff Corps system, and the under-officering of the native troops; the magazine eccentricities of Sir Garnet Wolseley; the great armaments of European Powers; the steady progress of Russia; the parsimony of English Parliaments; the political prejudice of Major Baring; the logical ineptitude of Sir R. Norman; the bland audacity of the Duke of Argyll in suppression and suggestion; the conduct of the generals charged with the Afghan expeditions, and so forth, all have something, and some of them a great deal, to do with the question of the peril which undoubtedly menaces England in the East. We are in full agreement with Colonel Cory on most of these points, and not in any great disagreement with him on the rest. But the worst of it is that in his case it is emphatically impossible to see the wood for the trees. A dissertation on the merits and demerits of Lord Lytton's Indian administration, still more on the successful attempt of the Duke of Argyll to hoodwink the constituencies two years ago as to the causes of the Afghan war, may be interesting in itself, but it is a case of *quid hoc ad Iphicli boves* in reference to the actual presence of Russia at Annau and her threatened

presence at Sarakhs. There is no doubt that there were many excuses for the officers of the old Indian army in the matter of the fatal security which handed them over, feet and hands tied, to the mutineers; but it is mere fiddling while Rome is burning to argue out this point when the Russians are within striking distance of Meshed, and almost within striking distance of Herat.

Although Colonel Cory has evidently done his best to adjust the new patch to the old garment, unfortunate discrepancies insist on making their appearance. He says that thirty years ago the outposts of Russia and England respectively were Loodiana and Astrakhan. The statement was true, after a fashion, in 1876; it is not true in 1881, and Colonel Cory must surely be well enough acquainted with the kind of adversary he has to meet among the prophesiers of smooth things to know the use that will be made of such a slip as this. Even where striking working-up of his material was possible he has not condescended to it. He had a great opportunity in a quotation which in his original book he made from a defender of the "ostrich policy" in the October number of *Fraser*, 1875. The wisecracker who wrote this used the following words:—"If the writers of leading articles in the daily press who frighten us with the rapid advance of Russia towards our Indian frontier could but form an adequate idea of the vast distance, the arid wastes, the exhausting climates, and gigantic mountain ranges which must be surmounted," &c. Colonel Cory apparently could not find in his heart to sacrifice his original answer to this plea, and therefore it is not for some pages that he makes, and then very distantly and feebly, the necessary parallel between the optimist ignorance of 1875 and the hard facts of 1881. The vast distance and the arid wastes and all the rest of it are gone, and in a very few months Russia will have a continuous line of railway and steamboat communication from St. Petersburg, through her own territory, direct to the waters of the Heri Rud or its tributaries. Colonel Cory knows this—he wishes to say it; but his seven-year-old arguments are too dear to him to be abandoned, and so he talks ancient history instead of talking modern fact.

Even these criticisms do not exhaust what has to be said against this unlucky book. Colonel Cory has weighted it with a prelude and a conclusion of the finest abstract eloquence. In the former we are treated to a demonstration of the improbability attending the theory of the approaching extinction of war, with abundant supporting quotations from Mr. W. R. Greg and Mr. Herbert Spencer. We again fully agree with Colonel Cory, but we wish to goodness that he would come to business. The epilogue takes us up to the Kara Korum passes, and in really elegant language talks to us about the "quick grip of the frozen wind," the "glint like a diamond of shattered glaciers," the "dark, olive-hued forests," the locusts, the course of empires, &c. "I think," said an Oxford tutor once with much politeness to a flowery essayist, "that it would be better if you would kindly suppose that I am a plain man, wishing to be convinced about the point at issue." That is what Colonel Cory seems altogether unable to suppose in reference to his readers. Those who agree with his views do not need references to Mr. W. R. Greg and Mr. Herbert Spencer, or picturesque descriptions of an imaginary traveller in the mountains north of Cashmere. Those who disagree with him will certainly not be converted by these things, and will probably laugh. We do not by any means say that a man who is dealing with what seems to him (and, we may frankly add, to us) a great national peril may not justly indulge in passages of impassioned eloquence, but he must earn the right to do this by marshalling his facts with rigorous exactitude, by giving no loophole of escape to the enemy, and by doing the logical smashing before he does the rhetorical ornament. Colonel Cory, we are sorry to say, has not done this. He had an excellent case, and he has made very little of it indeed. Some of the facts are there; but they are so awkwardly arranged, and wrapped up in such folds of irrelevant matter, that only those who know them already are at all likely to discover them or to draw from them the right conclusion.

The shortcomings of the book are all the more unfortunate because a book such as it might have been is really very much wanted. It is impossible to read the debates in Parliament, and still more impossible to read the extra-Parliamentary speeches of Ministers and the articles of partisan newspapers, without perceiving that an enormous number of persons in England are really without the least knowledge of the facts of the case. We have seen lately a remark made by an opponent of the policy of Lord Beaconsfield as to the contrast between the profound peace of India at the time of the Crimean war and the agitation caused by the war of 1877. Whether the peace of India was quite so profound as the author of this remark seems to think is another matter. But the remark itself seems to show what we believe to be a very general ignorance as to the profound and all-important alterations which have occurred in the relations of England and Russia respectively towards India in the last quarter of a century. An accurate and careful demonstration, assisted by plenty of maps, and made in forcible but not exaggerated language, of the difference between the state of things then and now would be invaluable. Ample materials for such a demonstration exist. There is nothing to prevent any one who has access to these materials, and is possessed of fair military and general information and of a tolerable literary style, from drawing up a statement of facts which should be absolutely impregnable, and which would exhibit the ostrich policy in its true light. Colonel Cory could have got at the materials; but he has only made the vaguest and most general references to them. He must be supposed to have the military and general information; but he shows little more

\* *The Eastern Menace.* By Colonel Arthur Cory. London: Kegan Paul, Trench, & Co.

trace of it than any ordinary journalist. Even as it is, his book would be a hard nut for the Duke of Argyll or Mr. Grant Duff to crack. But, unfortunately, its hardness is of the kind which makes it unnecessary as well as useless to attempt to crack it. It is unattractive in form to the general reader, and we doubt very much whether it would be found particularly instructive in matter. Even such an obvious thing as a sketch of the Turcoman campaigns of Lomakin, Lazareff, and Skobeleff, and a clear statement of their results, does not seem to have suggested itself to Colonel Cory as a necessary addition to his matter of 1876. He mentions, indeed, these campaigns and their results, but that is all. Now what the average "man in the Pockham omnibus" and the average member of Parliament who represents him require is exactly this detailed demonstration. They have both heard the conclusions put by Tory orators and seen them put by Tory writers, and they can afford to discard them as mere Tory stock-in-trade. But give them the premises, and there might be some chance of their opening their eyes to the fact that the Gaul is literally at the gates. It is the business of a writer of books, as distinguished from a writer of articles, to give facts—well-arranged facts, of course—but still facts, and plenty of them. This is exactly what Colonel Cory has not done; and, therefore, with all respect for his good intentions, we cannot discern in his volume any likelihood of its being of the use which it might have been if its author had been better advised, and especially if he had not had the unlucky idea of patching up an old book into a new one.

#### MR. BUCHANAN'S STUDY OF HATE.\*

"THIS romance," Mr. Buchanan is kind enough to inform us in some prefatory words, "is the third work of prose fiction from the writer's pen. In each of these works a subject has been taken which, though poetical in itself, involved a treatment transcending the exact limits of verse," whatever they may be. Now this is thoughtful on Mr. Buchanan's part. Without the bush which he has considerably stuck over his wine we might have failed to see, to use an Americanism, where the poetry came in. With this warning, when we come upon passages which, if they do not mean much, contain a great many fine words which would certainly not have been used by the people into whose mouths they have been put, we at once know that this is due to the fact that the subject of the work is poetical in itself. Mr. Buchanan, indeed, is generous with his information. Each of the last three works he has written, he goes on to tell us, "has a particular 'idea' or purpose, and descends to what some critics call the heresy of instruction. *The Shadow of the Sword* is a poetical polemic against public war"—its hero, we remember, refused to serve in the army from the purest motives, but had no compunction in knocking people over from a convenient hiding-place—" *God and the Man* is a study of the vanity and folly of individual Hate; *The Martyrdom of Madeleine* has for its theme the social conspiracy against Womankind." There is much that is pleasing in this kind of guide for critics and readers, but perhaps the most exquisite phrase in it is that which speaks of Mr. Buchanan's works descending to what some critics call the heresy of instruction.

*God and the Man* may indeed be called instructive in a certain way; but that way, it is safe to suppose, is not the way which Mr. Buchanan meant when he wrote the remarkable sentences quoted above. Besides this advertisement to the reader, Mr. Buchanan's "study of the vanity and folly of individual Hate" is prefaced by a "Proem" in verse, which is very far from being to our taste, but from which some lines may be quoted as a sample of its quality. It begins with a statement by a supposed speaker that he hates all men, and especially one man, and all other men because of that one man, and that "if God stood there revealed full bare" he would pray a prayer in despair:—

And the prayer would be, Yield up to me,  
This man alone of all men that see!  
Give him to me, and to misery!  
Give me this man, if a God thou be!

Shape on the headland in the night,  
Gaunt, ghastly, kneeling on his knee,  
He prays! his baffled prayers take flight,  
Like screaming sea-birds, thro' the light  
That streams across the sleeping sea.  
From the black depths of man's despair,  
Rose ever so accurst a prayer?  
His hands clench and his eyeballs roll,  
Hate's famine sickens in his soul.

The book itself opens clumsily enough with a prologue, in which we are introduced to Christian Christianson, an old man of ninety who is surrounded by nephews and great-nephews, and so on. We hear a good deal of these people and their relations with each other; we are told how "pretty maidens sip out of the glasses of their cousins, and lovers, while fond feet meet and knees touch under the table"; two of the boys quarrel, and one draws a knife; the old man beckons to them, and tells them to love one another; and from that time to the end of the book we hear nothing more of the little crowd of characters that appear in the first chapter. The writer goes back at once to the time of the old man's

youth, and "descends to the heresy of instruction" by telling the story of his life. This story, it may be noted, is curiously at variance with what is contained in the prologue. In the prologue we find this said of Christian's career:—"A stormy life and a terrible, say the gossips, not without blood's sin, and such crimes as twice told lift the hair and shake the soul; for if they speak sooth, he has sailed under the black flag in the Indian seas, and taken his share in the traffic of human life." Now, according to the story, nothing of this kind was ever done by Christian. The author may reply that he has put in the qualification "say the gossips," but the excuse will hardly better his position. The prologue is in its essence inartistic; but this would be perhaps the most inartistic touch in it if the words were so meant. There is no hint that the gossips were likely to be wrong, and thus expectations are aroused in a reader's mind which are never fulfilled. But the fact is that the proem, the prologue, and the study of the vanity and folly of individual Hate all hang so badly together that it is perhaps absurd to apply any critical standard to their relations with each other. One's natural impression—which may of course be quite mistaken—from comparing the proem and the book is that the book was an afterthought owing its existence to the proem, and that the author's love of his own work in the proem led him to stick it in front of the book without any regard to consistency. In the same way the prologue may or may not be the relic of a scheme which was never fully carried out, but of which the writer chose to retain the beginning merely because he had written it. If these things are not so, and if the entire book was and is intended for a harmonious whole, Mr. Buchanan has proved himself to be curiously ignorant of some of the elementary things with which a novel-writer who talks with such glib assurance of his own work ought to be acquainted. In connexion with the proem, before we return to the study of the vanity and folly of individual Hate, it may be noted that Mr. Barnard—whose work we have often had occasion to praise, and who has done some good drawings for other parts of the book—has illustrated this with an unhappy caricature of a well-known living actor. Probably the likeness is unintentional, and possibly Mr. Barnard's artistic taste made it impossible for him to put forth his best work on such a subject as he had to deal with.

But to come back to Christian Christianson, the old man with the relations who, so to speak, flash in the pan in the prologue. When he was a youth there was, and had been from time immemorial, a kind of Corsican feud between the Christiansons and the Orchardsons. The Orchardsons were at this time in a better position than the Christiansons, and, as far as the family feud went, matters were not mended by Christian's father dying in debt to Squire Orchardson. Before this occurred, to quote some of the author's fine writing, "the Orchardsons were more than shadows on the lives of the Christiansons; the very thought of them lay like lead upon the breast, choking the wholesome breath." If the very thought of them lay like lead, they themselves must certainly have been more than shadows, and, indeed, they proved to be tolerably substantial enemies. What happened was this: Christian was brought up by his brother to cherish the traditional hatred of the Orchardsons. Richard Orchardson, while they were lads, poisoned a dog of Christian's, and Christian, beside himself with rage, "swung the boy," who was a cripple, "round and flung him from him with one wild push and blow." Later in life Richard seduced and abandoned Christian's sister, and at the same time made love to Priscilla Sefton, daughter of a disciple of Wesley, with whom Christian had fallen in love. The drawing of Priscilla's character is in its essence decidedly creditable to the author, but it is spoilt, as is much else in the book, by the unequal and unsuccessful attempt to reproduce the speech and manners of a past time. But it is only fair to the author to say that in the case of Priscilla it is certainly less obvious than it is in other cases that, whoever is supposed to be speaking, and in whatever mood, the voice is the voice of Mr. Buchanan. The author's unlucky desire to impress us with a sense of a past time is the more unfortunate, since it comes upon us not long after the one really satisfactory attempt of the kind which has been made since the days of *Emmond*. To return, however, to the story of Christian and Richard. Kate Christianson, having in vain entreated Richard Orchardson to do her right, starts on a solitary journey. Here, again, Mr. Buchanan puts himself in the unhappy position of challenging comparison with other writers. He tells us the story of Kate Christianson's journey on foot in her sorrow, and with her impending trouble. Such a story was told in *Adam Bede*, and has since been told by Mr. Hardy in *Far from the Madding Crowd*. Mr. Buchanan was ill advised in trying to tell it again. He has a fine flow of big words, and a nice derangement of epitaphs at his command, but he is lamentably unequal to dealing adequately with such a theme as this. So, again, his treatment of the subsequent discovery of Kate's shame by her mother and brother is a crude and clumsy piece of work. It is even more impossible to believe in the brutality of Mrs. Christianson than in that of her son, and the result of the author's deplorable attempt to deal with a tragic situation is both repulsive and feeble. Nor can we give any praise to the melodramatic scene between Christian and Squire Orchardson in the death-chamber of Christian's mother. This is by no means an unfair example of the general style of the book, and we may lay a part of it before our readers. Christian has brought the old Squire into the room by means of a lying tale, and the Squire, having taken in the situation with considerable presence of mind, says what more Christian wants.

"Only this," answered Christian: "If you were not an old man, you

\* *God and the Man*. A Romance. By Robert Buchanan, Author of "A Child of Nature," "The Shadow of the Sword." 3 vols. London: Chatto & Windus. 1881.

should not leave this house to-night alive. But you may go. My reckoning shall be with your son."

Mr. Orchardson walked towards the door; then, as if impelled by a sudden thought, he turned quickly, and fixed his keen eyes on Christian's face.

"My son hath no reason to love you," he said, quietly; "but what evil hath he done you, that you should hate him so?"

Christian did not reply, but met the old man's eye with a look of terrible meaning.

"My son is a gentleman," continued Mr. Orchardson. "If you are thinking of the lying tales concerning him and your unhappy sister, let me tell you that he is innocent in that matter; nay, I have it from his own lips that he is innocent. And even were he guilty as you believe, 'tis but a boy's folly, and he would make amends."
